1459828021-7e270de1-4fc4-444e-a79e-5820a9a12bf9

A disk cartridge in which a disk is loaded is formed with composite synthetic resin including at least two types of thermoplastic resin, an anti-static polymer, and an inorganic filler, heat-deforming temperatures of at least two types of the thermoplastic resin mutually differing. The first and second sheets are wound around an axis, each sheet has hot and cold edges at the hot and cold ends respectively of the heat exchanger. More specifically, this invention relates to a blend for and method of producing container candles that demonstrates the improved properties of low shrinkage, little oil bleed, enhanced opaqueness and creamy appearance and enhanced fragrance retention.

1459828021-add18510-4c34-400b-b0c2-48fad40c62c9

A method and an apparatus for determining a dependency relationship between graphics commands based on availability of graphics hardware resources to perform graphics processing operations according to the dependency relationship are described. Six torque-transmitting mechanisms are selectively engagable in different combinations to connect different members of the planetary gear sets with an input member, an output member, a stationary member, and one another to establish seven forward speed ratios and a reverse speed ratio. or higher or a melting point of 297\xb0 C. In one specific implementation, the cache also provides for direct access to entries in response to direct access transactions.

1459828021-c0979a29-8992-4c50-84d3-d45fce04c8e7

Eyeglasses having an integral case. The hydrophilic structure is configured to spread condensation. The storage locker also comprises a main door for covering the opening. A timing control part establishes mutually different frame timing offsets to the respective frames received from the subcarrier assigning part. The method and apparatus include multiple levels of clock gating control circuitry and a clock

distribution network to generate a low-skew system clock signal, and generate a gated clock signal, from the system clock signal, and distribute the gated clock signal to a plurality of local logic circuits in the integrated circuit. One embodiment of the homogenizer comprises an entrance face positioned to receive light from the source, the entrance face having a first shape, a body configured to homogenize the received light and an exit face, the exit face parallel to the primary emitting face of the source.

1459828021-e6c1b9e7-caed-462d-ba9e-14b33c10dfb9

An exemplary optical disk drive for a notebook computer includes a tray, and a supporting bracket rotatably connected to the tray for supporting the tray when the tray extends from the notebook computer. Side walls are erected on both sides of a bottom plate of a body and a top end of each side wall is bent to form a flange. During a locked phase, the peripheral unit that is affected is temporarily taken out of service. The one procedure is associated with one of the respective types of circuitry that is actually available to be used by the first processor. The second part of the etch barrier layer has a thickness less than the first part of the etch barrier layer, and/or there is no etch barrier layer between the second part of the gate insulation layer and the second electrode plate.

1459828022-77c46ec4-df43-430c-b489-fe99386fbff9

A system that incorporates teachings of the present disclosure may include, for example, a processor that causes a STB to present an avatar. The clutch weight of the centrifugal clutch is assembled by stacking a set of five sheets of clutch weight component members, three of which have similar structures. The LED configuration permits a beam or flood of light of circular or oblong shape depending on the reflectors and covering lens. For example, the back section can be made from a material selected from a group consisting of HSLA steel, aluminum, and/or polymeric material. 40 mm filament diameter ultra tensile steel cords at 17-24 ends per inch.

1459828022-def80c01-15bb-4fef-a548-21bef4d14beb

A system and method for concurrently spooling and despooling print jobs, which allows print data associated with a print job to be despoiled from storage at the same time that additional print data associated with the print job is spooled onto storage. Several user profiles are provided from which a user may be associated. In another embodiment, the lamp is adapted to generate a predetermined pattern of light optimal for the treatment area.

1459828022-e2168178-5baa-4a1c-ac2d-08767d908e4e

Disclosed is a method for preparing a carbide-derived carbon-based anode active material. The assembly includes a base assembly defining a longitudinal axis and adapted to support at least two concrete structures, for example, on turntables positioned in spaced apart relation along the longitudinal axis. From the plurality of decisions, one is selected by determining which of the plurality of soft-decision detectors are able to come to a decision during error correction decoding. The signal injection system injects a synchronized PRS signal into the electrical component. Advanced control and power supply options are disclosed. Under this method, various interrupt affinity schemes are provided, which associate multiple processors, interrupts, and IO channels for sending the interrupts, thereby allowing the interrupts to be almost evenly loaded among the multiple IO channels and processors.

1459828023-0de7018c-f79a-493a-918b-187c241d229b

A personal water safety device includes a strap and a housing attached to the strap. The method comprises a calculation step for constructing a multivalued vector field and a smoothing step for smoothing the whole volume data. Discontinuities and steps are identified in the PSD distribution. The lip is contoured to include the three depressions, and a ring washer mounts on the annulus surrounding the walled

lip for added stiffness. The NAND-type nonvolatile semiconductor memory device further comprises a dummy word line driver adapted to activate a dummy word line to gate the dummy cell.

1459828023-39c9d853-56a1-4e65-abb9-3fbf6e01701f

A method of operating on an image of a document includes, for an electronic file that includes a representation of the document, portioning the representation of the document into non-overlapping areas. The apparatus includes a flow control valve connected in a conduit connecting the source in flow communication to a vaporizer. The pump is driven by an engine and the motor is drivingly changeable by operation of a speed change pedal. A cache check module checks a shared response cache for an entry matching the network request.

1459828023-e78d0773-9ed0-4f5d-a13b-96785152051c

The invention is a device for resting a spoon, stirrer or other cooking wares so as not to stain the counter top and for easy access. The device utilizes principles of pressure equilibrium and material resistance to dispense a regulated and steady flow of the biocide into the line. A magnesium-counter ion composition described herein may be useful for any of a variety of applications provided herein, such as maintaining, enhancing, and/or improving health, nutrition, and/or another condition of a subject, and/or cognitive, learning, and/or memory function. On the other hand, if the temperature of the NO<sub>x</sub> catalyst is lower than the specific temperature, the air-fuel ratio of the ambient atmosphere around the NO<sub>x</sub> catalyst is decreased to the target air-fuel ratio while decreasing the quantity of EGR gas in a cylinder so that the amount of generated smoke is kept within an allowable range. More preferably, a non-magnetic h.

1459828024-1149c750-41ce-4c21-94db-226635971048

A system and method is disclosed that provides for displaying on the screen of a handheld electronic device, an extended menu or a short menu, which is a subset of the corresponding extended menu. In TFTs having an LDD structure, a region whose LDD region overlaps with a gate electrode and a region not overlapping with the gate electrode are fabricated inside one TFT. A tension control zone is created between a pair of nip rollers disposed in zipper processing equipment and a zipper sealing station inside a thermoforming packaging machine by applying a predetermined torque to one of the nip rollers using a torque control device. Responsive to the determination of the illumination level of the taillight of the determined leading vehicle, the vision system is operable to apply a weighting factor to adjust the determined braking level for the determined traffic condition. The torque transmitting devices include clutches and brakes. The loop-control circuitry generates the control signal based on a comparison of detected peak signal levels in the receive signal path.

1459828024-1a3cc96f-104f-42c3-ad7a-48156709af2f

An automated banking machine operates using data included on user cards. Participants interact with each other through the IOM. This technically feasible capability, beyond conferring economic benefits of reusability and maneuverability, can be adapted to increase payload by adding drop tanks, or solid or liquid \u201cstrap on\u201d boosters, and might eventually be modified and evolved to perform manned aerospace missions, as well as single stage to orbit missions. Short names may be printed onto a reference card along with an indication corresponding to the drug's dosing regime. The non-zero-magnitude signal may, in effect, fill-in or complement the signal from the controllably conductive device, and any delay variation as a function of the firing angle of the controllably conductive device through the filter circuit may be mitigated by the presence of the non-zero-magnitude signal. The table top supporting assembly can further be folded into a fully folded position when the table top is folded to further reduce the size and dimensions of the picnic table when the picnic table is in the collapsed position.

1459828024-79072122-163c-41f2-b2d1-c7790b038867

This disclosure is concerned with optical adddrop modules. A printed image is subsequently placed on the coated textile. Each combination when summed in a particular way results in the market under consideration.

1459828024-ba309d76-66ce-445c-bb60-0981fd9b77ee

According to one embodiment, a nitride semiconductor device includes a substrate, an  $\text{Al}_x\text{Ga}_{1-x}\text{N}$  first buried layer, an  $\text{In}_y\text{Al}_z\text{Ga}_{1-y-z}\text{N}$  buried layer and an  $\text{Al}_x\text{Ga}_{1-x}\text{N}$  second buried layer. The polymeric sidewall and base are contiguous with each other and define a shape of an open top container. A first phase consists in biasing the first fixed electrode with the measuring voltage from first binary word and reference voltage, and the second fixed electrode with low voltage, and a second phase consists in biasing the second fixed electrode with measuring voltage from second binary word, which is reverse of the first binary word, and the reference voltage. The flow retrieval table 5 stores a post-mask retrieval key and a flow retrieval in a correspondence relationship and outputs a flow retrieval corresponding to the post-mask retrieval key output from the mask section.

1459828024-fdf8e70b-86e9-406c-a86d-94f16e52ab8e

A multimedia reproducing apparatus having excellent operability and amenity. The bushing is located in the second hole and has a first end abutting the first material and a flanged second for securing the bushing to the second material. The second portion includes a second panel having a plurality of third embedding elements and a plurality of fourth embedding elements embedded with each other, and the second portion includes a plurality of first embedding elements and a plurality of second embedding elements, such that the first panel can be pushed to form a gap for replacing the second panel. The user can then initiate any displayed test. In the partial test score model, a partial score is assumed to be a true-false average of a plurality of items having the same parameters. The surface of the backlight unit that is opposed to the liquid crystal display panel is divided into a plurality of subunits capable of being individually adjusted in brightness, and the liquid crystal display part is divided into pixel blocks which are surface portions opposed to the respective subunits.

1459828025-0dc405ed-bc93-48b8-a3ea-ab8c3b69beb1

A system and process for highlighting the current speaker on an on-going basis in each frame of a low frame-rate video of an event having multiple people in attendance, such as a video teleconference, is presented. The method includes a holding step of holding the reticle on a reticle stage which has a reference mark, and a detection step of detecting position of the alignment mark on the reticle based on alignment light reflected from the alignment mark and detecting relative position between the reference mark on the reticle stage and the alignment mark. The linear motor may include a stationary component and a moving component, wherein the moving component is coupled to the movable basket, and wherein the stationary component is coupled to the stationary base.

1459828025-98f1658b-0326-439a-a4b4-3696b4f0ca3f

A method for fabricating an inductor structure having an increased quality factor is provided. The cable ferrule has an end face at which an optical core cable is exposed. A selectively applied opaque layer prevents light from a light source from passing through at least one selected portion of said substrate. To service the pipe run, the cover may be opened and the inner pipe lowered into the outer pipe. The interpolated values may be converted to frequency deviation values, and a predetermined number of the frequency deviation values may be averaged.

1459828025-cd598dba-f4d0-431c-9939-5907d0f77b60

A system for partial brute force collation of a print job includes a printing device having ROPM capability and memory. A pair of pivot holes is defined in the top plate for engagingly receiving the knobs. The method generally includes coating

a photoresist on a substrate; immersing the substrate in a liquid; exposing the substrate; removing the liquid from the substrate by rotating the stage and/or substrate or spraying the substrate with an inert gas; and developing the photoresist.

1459828026-0f197e8f-f5ee-4898-a9a9-f6132a59f66e

Methods, devices, and computer programs are presented for consolidating overlapping data provided by multiple sources. The first and second images each have at least 4 non-parallel lines therein. The bottom surface is opposite to the light output surface.

1459828026-0f26ed23-acf9-472f-9eb7-37ff3db2e5d6

A child's stool having a pair of horizontally spaced, parallel, vertically extending side walls, each having a pair of receivers provided therein. The chip is placed on the substrate. A circumferential wall of the rinsing area has at least one inlet as well as a drainage outlet with an orifice opening for a rinsing medium.

1459828026-94006e54-dc0b-4f9d-a173-09c5c9a76cf7

The present invention provides an all-digital frequency synthesizer circuit using interpolation technique and Linear Feedback Shift Register. Each of the rib assemblies are coupled to the apex of the shaft at a proximal end and to the canopy at a distal end. When the bound reagent is chlorite, the complementary reagent is an acid or an oxidant. A final stage comprises a coefficient multiplier and an adder. A processor is responsive to a receive packet to determine if the receive packet matches one of the plurality of packet filters and the processor, upon determining that there is a matched packet filter, is adapted to place the receive packet in the filter receive queue assigned to the matched packet filter.

1459828026-cd41667c-067c-4364-88e2-39be1a6c9cb6

Disclosed herein are methods for the isolation and purification of antibodies wherein the use of an affinity chromatographic step results in an antibody composition sufficiently pure for pharmaceutical uses. They contain laminarized surfactants and, optionally, hydrophilic stabilizers. The selection is performed by the first base station or the application server.

1459828026-fa726665-0e4a-4a9d-bbf2-481d5373253d

Disclosed is a multi-layer film comprising: a surface layer having a thickness of 10 to 50  $\mu\text{m}$  made of an ethylene-olefin copolymer having a density of 0. The body defines a hollow region therewithin. The traffic probes can analyze the collected data to identify traffic anomalies, and in response, change the amount and type of data collected, as well as the frequency of reporting the data to the central control system. After evacuation, dosing and gas fill, the other tube is tipped off in the similar manner. The terminal may receive the feedback from one sector and may send the second transmission with CDMA or OFDMA to the same sector or a different sector. The second concentration controller has a slower response time than the first concentration controller, however the second concentration controller provides the system with long-term stability and can be used to provide updated data to the predictive control algorithm.

1459828027-4321d256-b811-4d0c-89d0-702bb6f547a9

A piston for a compression ignition internal combustion engine includes a piston body having a combustion face defining a combustion bowl, and the combustion face including a compound bowl surface and a compound rim surface. A method for transmitting content data includes receiving content data, and passing at least a portion of the content data based on a prescribed rate. An absorber layer can thus be advantageously produced, having a quadratic roughness of no more than 1  $\mu\text{m}$ , measured in a close range of no more than 50  $\mu\text{m}$  diameter, and preferably being made of a corrosion-proof hard alloy comprising tungsten carbide, in particular

WC\u2014CoCr, WC\u2014Co, WC\u2014FeCo, WC\u2014FeC, WC\u2014FeNi, WC\u2014Ni or WC\u2014NiCr. If the directions of arrival of the received signals differ greatly from one another, the directing means command the antenna array to form, in addition to the main beam, one or more diversity beams, which are formed in the direction, wherefrom a signal exceeding the predetermined threshold value is received. The first receiving elements is connected to means for the periodic translatory adjustment of the first receiving element with respect to the ligament. The method for packaging a case with a product includes: conveying a first plurality of the product to a first lane; supporting the first plurality of the product within the first lane; conveying a second plurality of the product to a second lane; shifting the first lane and the second lane in a first direction; and dropping the first plurality of the products into the case.

1459828027-57044a8f-5302-48a6-af6c-163803ea14fb

A method of promoting the healing of a lesion in a smooth muscle, comprises selecting a smooth muscle portion having a lesion, and applying a non-excitatory electric field to the portion, which reduces the mechanical activity of the portion. The block system includes blocks of different sizes that are configured to be compatible with each other in the construction of a retaining wall or free-standing wall. The method further includes attaching a wafer of dielectric material to the insulation fence.

1459828027-730694c7-233b-427c-9deb-c4d4c9c4d7cb

When a two-dimensional code including a number of location symbols is detected from an image. To this end, a voltage Vdd\u2032 higher than a power supply voltage Vdd of a power supply line for peripheral circuits is supplied from a power supply line for memory cells as a power supply voltage for memory cells. Improved structures and techniques are provided for securing such other components to the stent-like supporting structure of the valve. The upper surface of the light inlet section is bonded to the lower surface of the base. The printer driver returns the processed data to the data processing device through a memory with the data processing system.

1459828027-a8fec76c-b0d9-4299-a99c-c69808b192ad

A gas generator or inflator 10 preferably contains a housing 12 formed from welding a cap 14 and a base 16 in nested and coaxial relationship. The invention relates particularly to an analog-input circuit with at least two channels substantially identical in design, for parallel signal input and/or output, which are parallel connected and/or parallel connectable in the region of the peripheral interface. The cavity is defined by a first curved surface positioned adjacent the end of the first channel, a second curved surface positioned adjacent the end of the second channel, and at least a third surface between the first and second curved surfaces. The conductor extends through at least a portion of the plurality of the through vias, forming a plurality of metalized through package vias. The join ring at a periphery thereof extends at least two circumferential elastic engaging hooks.

1459828028-d2a37002-1799-4932-8bbe-3486dbe72383

A process for forming a capacitive structure that includes an upper layer having a first capacitor electrode section therein. The system controls the electronic device in response to the sensed physical characteristics. The base is cruciform and the beams are disposed respectively at ends of branches of a cross formed by the base. In addition, one embodiment of the invention manages the lifecycle of a first session object based on corresponding lifecycles of one or more related session objects and also the type of relationship existing between the first session object and the one or more related session objects.

1459828028-e2a64061-7da0-422e-8493-fbc932e017b5

A non-magnetic mono-component toner of the present invention comprises, at least, a plurality of mother particles and a plurality of CCA particles adhering to the

mother particles. A portion of projected streaks on the friction joining steel plate is designed to have a Vickers hardness at least 3 times greater than the surface of the steel products, which allows the projected streaks to more easily enter the steel products thereby increasing the friction coefficient between the steel products. A historical rate at which the computer system has transitioned between the first and second operating modes is determined, and the requested transition is permitted in response to the historical rate being less than a first preselected setpoint, but denied in response to the historical rate being greater than the first preselected setpoint.

1459828029-3b8c6eee-316d-468b-b39e-1d21e04f7af4

This document describes techniques for effecting a virtual disk. Then, the diagnostic code generation terminal 10 acquires the setting status of the diagnostic code generation terminal 10 in response to receiving the input of the status check code, the setting status corresponding to the setting status check item, and generates a diagnostic code indicating the setting status based on the acquired setting status. This 2D dipole location is then used to determine the 3D position and momentum of a current dipole responsible for the observed magnetic magnitude image. With automatic compensation for pre-etch CD, a very tight distribution of post-etch CD is achieved.

1459828029-4eafeb00-a2a3-4f8a-b051-73ccad65d7cb

The present invention relates to a pigment dispersion and a method of producing a pigment dispersion by grinding a grind mixture comprising a pigment, a humectant, water, and a polymeric dispersant. In certain example embodiments the spacer may be substantially U-shaped, whereas two pillar-like spacers may be used in connection with certain other example embodiments. The toe receiving member is configured to engage the toe portion of the boot.

1459828029-8642ee54-7621-4d93-a8cd-2f0e0775bf69

A constant velocity universal ball joint includes an outer joint part, an inner joint part, torque transmitting balls guided in pairs of tracks, and an annular ball cage held between the outer joint part and the inner joint part, wherein the ball cage forms an inner face which is internally widened between two end apertures of the ball cage. The lift bed may also provide safe operation for lowering and raising the lift bed through use of a bed frame, safety devices, and movement means. Solder can be used as the conductive material, for example. The notification communication is sent to the wireless device associated with the data store.

1459828030-3a3969ab-2f0f-4837-b57e-58588068029c

In one aspect, the invention relates to an immunogenic composition that includes a mutant *Clostridium difficile* toxin A and/or a mutant *Clostridium difficile* toxin B. A data line is opened between the display device and a user terminal device. In storing and retrieving objects from the shelf, a forklift machine advances with its left and right forks aligned with the left and right insertion channels, until the forks are securely under the object. Context relevant information served to the device depends on the identity of the user, the location of the device, and the proximity of the device to persons or objects. Signal read from a magnetic disk is entered into a RLL decoder where the RS code portion is RLL-decoded. The housing itself also may be thermally conductive to conductively spread the heat and convectradiate the heat away from the lamp.

1459828030-8689d0fe-3f16-4ad2-9d75-bf7839ba55a7

Method and system for collecting and filtering messages received at an event source platform and delivering the filtered messages to a collection host platform. The field-effect transistor comprises a layered semiconductor structure which includes a first group III nitride compound semiconductor layer doped with a charge carrier, and a second group III nitride compound semiconductor layer positioned below the first layer, to generate an electron gas in the structure. The network includes at

least two nodes including the node assigned to be the owner. Lamps are connected between the two end plates and located in the mediate member.

1459828030-a7bb5efc-9bca-48a9-9498-3bad0a468a72

A desiccant cartridge retention device used to secure desiccant cartridges to fluid flow tubes and/or canisters of receiver/dryer and accumulator assemblies. The shield can be employed to maintain a substantially particle free environment such as in photolithographic systems having critical surfaces, such as wafers, masks, and optics and in the tools used to make these components, that are sensitive to particle contamination. The liquid crystal display device further includes a line memory that outputs a data signal to a data integrated circuit by dividing the data signal into at least two data signals to increase a data processing speed.

1459828031-40a0a8d0-0587-459a-9b14-a1b2a307af17

A printing apparatus configured to print on the pages of a block of printable pages that are pre-bound by a binding along a binding-edge of each page. Specifically, the invention incorporates a series of rollers that create multiple pinch points to compress the solid fraction while removing liquid. Besides, the yellow ink nozzle, first magenta ink nozzle, first cyan ink nozzle eject the yellow ink, magenta ink, and cyan ink respectively.

1459828031-a8e0b397-5782-485d-abc0-1b0f0fd26b2b

A weight-based, multiple filler filling machine has a simplified wiring arrangement. The preparation possesses an improved bioactivity, and is useful in the treatment of various cognitive and mental conditions and disorders and for maintenance of normal functions of brain-related systems and processes. If the network is overloaded or has limited bandwidth remaining, the network may refuse to admit the new device, or if the new device is isolated, may force some devices that are members of the network to leave or migrate from the network to allow the isolated device to join the network. This is the case because the correction can even be implemented for small predicted signal changes, such as those occurring during a currently transpiring operating point of the internal combustion engine. The engaging member includes an engaging portion, a first shaft portion and a second shaft portion. A coupler is attached to the plate and releasably engages the handle adjacent to the first end to secure the handle to the plate.

1459828031-afac7907-da90-4277-94f4-931d39b2b56c

A method, system, and device for controlling a mobile device with a touch screen are disclosed. A second fixed time interval at which to display at least a portion of the plurality of CGM glucose values is received. External cylindrical surfaces concentric with the cavities rotatably support a pair of tower plates which include circular openings received over the external cylindrical surfaces. Cylinder identification ranges of a prescribed angular length in consideration of an advance angle and a retard angle are set based on the reference crank angle positions. In another embodiment, both the conductor layers for the VLEDs serve as touch sensor electrodes.

1459828031-eed1d373-0518-4159-ae5b-588b160204ca

An illustrative embodiment includes an implantable cardiac stimulus device comprising input circuitry configured to reduce the time required to return to small signal operation after a disturbance of small signal operation. The venturi includes an angled pipe which joins the main piping system at an acute angle and which receives air from a blower. Each of the cavities has top and bottom openings. The second tube further includes a second support face at an end of the barrel that engages the first support face. A naming convention is used to define the names of the data types and operations in the web services interface corresponding with data types and functions of the application.

1459828032-0462a2ec-f5e8-447d-a75e-9e1c56fe97ce

System and method for providing a low noise signal having a broad tuning range, with associated jitter no more than about 10 percent of the selected period of a target output signal. Applications of these compounds in the treatment of medical conditions, e. Electrogram data can be sensed at various locations in the heart using an electrophysiology catheter, and the electrogram data is mapped to the elements of the FEM. Thus, uniform transmission of radio IQ data and frame synchronization for different standards may be enabled via a common radio interface between a Radio Equipment Controller and a Radio Equipment. For a multi-layered cover, the inner cover layer is comprised of a low or high acid ionomer or ionomer blend and the outer cover layer is comprised of a soft, very low modulus ionomer or ionomer blend, or a non-ionomeric thermoplastic elastomer such as polyurethane, polyester or polyetheramide. A second electrically triggered control valve is provided, which is disposed near the fuel injection valve and by which the pressure prevailing in a control pressure chamber of the fuel injection valve is controlled, by which pressure the injection valve member is urged at least indirectly in the closing direction.

1459828032-121c95a5-2b1d-4095-84f7-fd7504643ddd

A watchdog timer circuit for use in microcomputer monitor systems is disclosed. The communication device includes a plurality of surface sensors that when activated, guide the user in call placement, routing, control options and general communications. A computer pointing mechanism is coupled to the primary control device and a data storage device is coupled to the primary control device. Some embodiments include integrated circuit packages.

1459828032-58201fe3-2643-499d-a0b1-b7b6c6f09a35

The present invention relates to a clip type light emitter, and in particular to a clip type light emitter capable of enhancing a visual field at night by detachably engaging a clip type light emitter to a leisure cap generally used for a mountain climbing or fishing or travel or various sports. Memory modules comprising a number of volatile memory devices may be fabricated. Also, a process for preparing this at least partially fire resistant thermal insulation material. According to yet another aspect, an electronic triage tag is configured to include a colored card insertion region for inserting a colored card for preventing the device from being inadvertently activated, an LCD screen and a series of LEDs for displaying the triage status of a patient.

1459828033-103f0428-97fc-4225-8df2-ea2f0c1774b0

Devices and systems for repairing bone fractures and more specifically a fracture repair plate that provides for fixation of a metaphysis to the diaphysis of a long bone, for instance a fracture between the proximal humerus and the diaphysis of the humerus. The HFO-1234ze and HFC-245fa are prepared through a two-stage gas phase fluorination reaction by using 1,1,1,3,3-pentachloropropane as a raw material. A distribution module and a plurality of rectifier modules are connected to the power bus. The thickness of the first edge portion is less than the thickness of the interior portion. As the pixels are analyzed and assigned to color categories, the method stores information in the computer regarding the number or percentage or pixels in each of the color categories.

1459828033-18c5e390-e89d-4dc0-aff0-65494f5269bc

The present invention relates to a pharmaceutical composition for the prevention and treatment of diabetes or obesity comprising as active ingredients a compound which inhibits the activity of dipeptidyl peptidase-IV, a pharmaceutically acceptable salt thereof, a hydrate thereof, or a solvate thereof, and one or more other antidiabetic or antiobesity agents. This rectangular box is constructed in a manner so that it is composed of two halves divided vertically through the center of the long axis of the box. This area is located using a light source. An external calibration including camera position and orientation is then computed for the camera based on the calibration information obtained for the one or more

calibration points. The excavation is then backfilled. In some embodiments, a packaged semiconductor device includes an integrated circuit die, a molding compound disposed around the integrated circuit die, and an interconnect structure disposed over the integrated circuit die and the molding compound.

1459828033-a8e32194-3736-419e-a21d-d803ccdc8318

A color measurement device includes an error detection function for color printing control. A client computer receives timestamped packets of compressed encoded audio data from the first audio stream, decodes that data and resamples it to a highest sampling rate supported by playback equipment such as a sound card. In the production method, the passivation is polarized together with the ceramic layers. In another illustrative embodiment of the appliance, it is achieved by terminating further fuel flow thereto. The first response and the second response are diverse or uncorrelated. Preferably, the coated fabrics have overlaid a second uncoated fabric on the inner surface of the coated substrate.

1459828034-141d8420-0f5c-4b28-ac93-2e8518625511

Technologies are generally provided for maintaining performance level of a database being migrated between different cloud-based service providers employing machine learning. The band has an outer panel with radially outwardly depending treads to engage with the land surface and raised traction supports on an inner panel to engage with the surface of the wheels of the toy vehicle. A composite image can be formed of the passage of radiation through an object acquired by the first and second sets of radiation detectors as the object is translated by the first and second sets of radiation detectors.

1459828034-7a7bd346-f81d-46bb-8c31-93c738d49158

Embodiments are directed towards the visualization of machine data received from computing clusters. The component that generates the offset is rotationally symmetric around the rotational axis of the optical element. The housing may comprise a top wall, a first side wall, a second side wall, and a front retaining wall. Alternatively, these anodes can be used with cathodes that facilitate other desirable reactions such as converting carbon dioxide to methanol. The movements of both carousels are automatically controlled so that at appropriate points in the testing cycle they rotate simultaneously about a common central axis and a crucible is deposited on a weighing platform by controlling the vertical motion of the entire carousel apparatus.

1459828034-b59787be-2690-4892-b4a0-487d99fa3f4e

System and method for creating, configuring, representing, and using variables in programs. The surface of said materials is at least partially silanised. The system provides a graphical display of useful golf-related information and can send a set of parameters tailored for a specific course to a real time tunable GPS to adjust for optimal performance and can adjust measurements to compensate for environmental condition changes. The transmission of the IPTV signal over the first network connection to the first device is ended. The compounds of the present invention show a selective and strong inhibitory activity on glycogen synthase kinase-3 beta, and are useful as medicaments for prevention and/or treatment of diabetes, diabetic complications and neurodegenerative diseases or as immunopotentiators. The powder is constituted by a scale-like base material, a group of particles including titanium dioxide particles deposited on a part of a surface of the scale-like base material, and a thin film of a composite oxide containing titanium and iron coating part of the surface of the scale-like base material.

1459828034-e36ea2f6-c49d-4cf0-bec1-0da848002cf7

The invention aims to suppress or prevent the vibration that can occur due to the intervention of a low-rigidity part between detector and rotating body. The Ribosomal Complex is composed of the subunits of ribosomes, the ribosomal subunits generally retaining sufficient integrity to preserve substantially the double-

stranded nature of the large r-RNA's contained in the ribosomal subunits. The catch extends from the bottom of the clip in a direction that the keyhole member is offset from the bottom of the clip. The example method further planarizes the interlayer dielectric layer and the via, and forms metal interconnects on the interlayer dielectric layer.

1459828035-0c54ac9a-5e01-4037-9074-c2748a212b18

A wellhead has, instead of a conventional Christmas tree, a spool tree in which a tubing hanger is landed at a predetermined angular orientation. The valve also includes a flow diverter disposed within the body between the inlet and discharge passageways to receive a fluid from the inlet passageway in an inlet direction. The focus detection apparatus has high precision, efficiency and process applicability. The wavelength conversion section is provided over the light transmitting section. Information regarding the pending emails are directed to the user's mobile telephone or PDA device, allowing the user to determine whether to respond to the electronic mail presently or defer response, in accordance with the user's preference at the time of receipt.

1459828035-24a2a472-68d9-4fcf-9215-f7146b96eae5

This invention relates to methods for neuroprotection, promoting survival of motor neurons and the treatment of motor neuron diseases by preventing cell signaling through the classic prostaglandin D2 receptor DP1. At least one of the bead portions having a bead heel and a bead toe wherein the bead heel is radially outward and axially inward from the bead toe. The support member includes a metal reinforcement for preventing wrinkling of the seal portion at bends of the sealing arrangement.

1459828035-c4ee8184-f799-4b69-bc9a-0e32c3e5b2fe

Monoesters derived from a dihydric alcohol and a carboxylic acid such as benzoic acid are secondary plasticizers for non-aqueous and solventless plastisols containing primary plasticizers that do not contain unreacted alkanol groups. The mass spectrometer comprises an ion injector that is configured to provide a plurality of ions for analysis and an ion selection unit that is adapted to receive the plurality of ions from the ion injector and provide only those ions having a selected mass-to-charge ratio for detection analysis. In addition, compositions and methods for identifying compositions for use in the treatment of neuropsychiatric disorders via these genes and gene products are described. In addition to the slides associated with each section, each of the sections is associated with one or more properties having values that can be defined by an author of the presentation. As an example, mass flow controllers can regulate the flow rates of a hot and cold stream of de-ionized water to produce a stream of de-ionized water at a desired flow rate and temperature.

1459828036-46474f98-ff45-4ce4-8cdf-b499286139cc

When electric elements are formed on a ceramic bar or the like, the positional displacement of the respective elements occurs due to a division exposing process or the like. Improving detector accuracy decreases missed detects and false detects. The logical state of a center bit triplet of the byte is detected. Resistive layers, each resistive layer including a first region are disposed in the first through region, a second region disposed in the second through region, and a third region disposed in the trench. Other aspects and embodiments are provided herein.

1459828036-d64bd68d-1b02-477f-a924-bd8d8bc6c2ed

Empirically derived models are used to relate user perception to objectively measurable characteristics, under a criterion of nearly perfect co-variance between predicted MOS values and the variations in the values of the objectively measurable characteristics. The first side wall constitutes herein the impact surface and the second side wall constitutes the support surface. In one aspect of the present

invention the packaging system controller provides packaging instructions by retrieving a predetermined set of packaging instructions associated with a particular part. In use, the hitch guide pivots to an extended position beneath the hitch socket at the end of the trailer tongue to guide the ball under the socket, and pivots to a retracted position beneath the trailer tongue after alignment. A programmable controller prevents the unit from being used solely as a keep warm appliance, and a unique design allows cooling of the controller during cooking. This allows the hinge to separate from the locking tab.

1459828037-622216ef-d0fa-4159-b329-6df605c154c7

Systems and methods for providing wireless enabled inventory peering are disclosed. An object type link table links together records in the meta table, and a content data link table links together records in the content data table. An exemplary method facilitates snapshot function coherently across a plurality of loosely coupled storage controller nodes via message communications through network interfaces.

1459828037-97b08f2e-63b7-469f-8080-218fa862d084

A method and system for matching digital information flow to the human perception system. When the images of remote conferees are displayed on a video conference station, the voice activity detection is utilized in order to designate which remote speaker is presently speaking. Here, the sensing electrode pair of the devices of the invention are suspended over an inert substrate via one or more posts used to space the electrodes from the substrate.

1459828037-acc81d17-2e45-407e-ba56-8d715bf03376

The present invention is in the field of nucleic acid-based genetic analysis. In accordance with an image forming apparatus provided with an optical beam scanning apparatus according to the invention, not only a wave front aberration on a photoconductive drum can be suitably corrected, but suitable beam diameter and beam profile can be obtained on the photoconductive drum. The sub clutch transmits the driving force from the input shaft to the output shaft during gearshift.

1459828037-c88df413-010a-43d8-9329-a7fbeb9769a

A sheet conveying apparatus includes an apparatus main body, a sheet cassette, a mounting portion and a conveying unit. The guiding rod is provided with a protrusion for restricting the movement of the optical pickup unit when the guiding rod is in a predetermined rotational position. The output signal arising in dependence on the deterministic test vector is evaluated by the application circuit by at least one signature register. The holding frame lamp is configured to retain a prefilter. In an embodiment, the modified request message is passed to an application for processing.

1459828038-d8d590f9-823b-4d41-8471-fd930e10871a

Compounds of the general formula are described: . The present invention is directed to interlayer film for a laminated glass, which comprises at least a pair of protection layers and a sound-insulating layer sandwiched between the pair of the protection layers, and which has a wedge shape as a cross-sectional shape, a wedge angle  $\theta$  of  $0^\circ$ . Scaling of the system is easily accommodated. A decoder decodes write address of the memory cell in response to the control circuit and regulating a constant current to flow through a selected bit line with reference to a result of the decoding. The treatment provider may also access the information through secured dedicated websites via the Internet.

1459828039-271d3730-7b5d-4ff2-89af-1f80656c45f1

In a method of determining a beam to be generated for a user, a user may be selected from a user population based on a parameter that is tracked for each user in the user population, and a beam preferred by the selected user may be determined. The activator precursor compositions are formed from a support

material, an organoaluminum compound, and polyfunctional compounds having at least two aromatic groups in which at least two of said aromatic groups each has at least one polar moiety thereon. Related radiation detection devices and methods are further included. The nozzle head housing further includes an interior chamber formed in the nozzle extension member which has a nozzle outlet opening, the interior chamber being connected to the nozzle outlet channel for receiving sealant material therefrom. The center rod has a first shank end and a second tool end.

1459828039-724debb3-d7cf-43d3-b66a-a84607636c85

A method of generating a non-reproducible printed image, for example on a check, involves printing a first, background layer of ink on the document, and then printing data on top of the background layer. The upper free sublayer may be softer and thicker than the lower free sublayer to promote this, and may be doped to reduce its magnetization while maintaining physical thickness. Also provided are kits and systems for use in preparing the subject compositions. A bearing rotatably supports the rotational shaft and is entirely spaced-apart from the end portion of the rotor in an axial direction of the rotational shaft.

1459828039-aab120e9-77ce-4583-9643-fa9162fbf4ed

Apparatus and methods are described for controlling the positioning of a document relative to a read head in a document processing system. The distal extremity has a peripheral wall defining a cavity and a distal opening communicating with the cavity. A first of the processing cores includes a router that includes at least an allocation unit and an output port. A first coder is configured to code first supplementary information, including coded pictures and indicating respective picture types of the coded pictures, in a decoding order of the coded pictures. Such compounds are represented by Formula I as follows: wherein A, B, G, Y, R1, R2, R3, and R4 are defined herein. The second entity optimizes its production to generate a request for the supplies and reoptimizes in response to promises received from the first entity.

1459828039-db2d32d3-ca3b-4fae-9beb-d46523123f39

A method of scheduling and making material time balancing decisions for a set of balanced tasks. The outer tube has slots accompanying adjustable electromagnetic coupling structures. The antenna array may be used in various installations, including cellular, PCS, MMDS, LMDS and in-building communication systems such as LANS or WLANS. The results of multiplications by the multipliers when the coefficient groups kb1 to kb3 are inputted, are added between corresponding multipliers by adders. A connector piece connects the deployment ramp to the vehicle. The BWE encoding unit generates as the extension data a first parameter which specifies a lower subband which is to be copied as the higher frequency spectrum from among a plurality of the lower subbands which form the lower frequency spectrum obtained by the MDCT unit and a second parameter which specifies a gain of the lower subband after being copied.

1459828040-bdddf941-d026-47f1-b64e-7822d6c603f7

System for drying a tissue or hygiene web. The method includes assigning public safety answering points to ports located in a network, where each of the ports is associated with a calling party number and a geographic location. The apparatus still further includes a portion-to-be-urged for receiving an inclined downward elastic force of a first main assembly side elastic member provided in the main assembly of the apparatus to urge the longitudinal positioning portion and the second portion-to-be-positioned.

1459828040-f928a0ef-29ae-4326-97c0-56e9fe9d9ae0

Systems and methods are disclosed for making content elements available for use at a public computing kiosk operated by a first-party operator. Even when the name corresponding to the data is not registered so that it is impossible to transfer the corresponding name instead of transferring the data, it is possible to reduce

the amount of transfer data among the data transfer devices by transferring the compressed data in which this data is expressed in a compressed form by utilizing the name corresponding to the registered reference data. The second clip component has a flange for contacting the second member, a tube for receiving the shank, and pawls inside the tube.

1459828041-9f9d8628-d360-4907-b652-53ca66b3ce45

An \u201cOblique Image Stitcher\u201d provides a technique for constructing a photorealistic oblique view from a set of input images representing a series of partially overlapping views of a scene. In certain embodiments of the method, the infiltration temperature may be 50\xb0 C. The fuel supply system is intended in particular for pumping fuel to an internal combustion engine of a motor vehicle. Ratings, compliance, ball flight path data can be calculated and displayed, for example on a map or timeline or both. Thereafter, a nitride film and an oxide film are removed.

1459828041-e9dee4d6-f3e4-4a47-a90d-dc0ddd6e0dec

The forgoing method, system, and apparatus relates to a touch sensitive display for use with a programmable multimedia controller. Frame-to-frame quantitative variations in temperature and position of anatomical nodes of the body maps are determined for the sequence and compared to reference profiles to produce estimates of physiological condition and psychological state. The p-type layer forms the base of the NPN transistor. The slides allow movement of the work surface vertically prohibiting rotational movement of the work surface.

1459828042-6cc2c52a-521e-4617-894c-50179bd419b6

A fiber optic connector assembly includes a fiber optic connector having an outer housing with a connector interface end, a connector interface housing mounted at the connector interface end, and a retention nut rotatably mounted about the outer housing. Furthermore, as a consequence of its construction, no medically relevant rule can be overlooked by the reasoning system. User age and name are entered in the date of birth block and signature block. In a described preferred embodiment, the applied energy pulses include laser pulses, and the physical element conjugated with a biological carrier is a light-sensitive semiconductor having an impedance which substantially decreases in the presence of light.

1459828042-e4a90cd0-0f49-4e06-abd9-bbfba805cc54

The present invention provides estrogen receptor ligands of structural formula the pharmaceutically acceptable salts, stereoisomers, and prodrugs thereof, and the pharmaceutically acceptable salts of the prodrugs, wherein R1, R2, R3, R4, R5, X, and Q are as defined herein. One or more masters may make a request on the ring at the same time, such that multiple transactions are simultaneously pending. The use of a wear member permits the use of lighter weight siderails and bushing plates. The shared radio is switchable between serving the BSS traffic and serving the mesh traffic. The three assemblies are connected to each other through several flexures.

1459828043-a6012dff-e640-4353-92ba-599bd8cad1cb

A multi-view imaging system for Vehicle Occupancy Detection including a gantry mounted camera and illuminator to view the front seat of vehicles, and a roadside mounted camera and illuminator to view the rear seat of vehicles. An input device comprises a component for capturing video images, an input image processor that generates an output signal responsive to motion from the video images, and an output image processor that is programmed to effect movement of the object on the graphical display in response to signals received from the input image processor. Each piece of the implant is inserted with its associated insertion device.

1459828043-a6fe4742-5d87-46f3-8efa-abbb5a67282c

An integrated information presentation system includes environmental controls that at least enhances the experience of giving a presentation. In the vehicle seat, the

seat back body includes a frame having a frame shape and serving as a framework, a front-side cover portion placed so as to cover a front side of an inner space of the frame and supporting a back of a seated occupant, and a back-side cover portion placed so as to cover a rear side of the inner space. An adjustment circuit includes a first delay circuit supplied with the external clock signal, and a detection circuit which detects a skew between timing of a first clock signal output from the first logic circuit and a second clock signal output from the second logic circuit section. An image forming method employing the photoreceptor is also disclosed. A color filter overlap is formed at the border region between the reflective display region and the transmissive display region.

1459828043-b88b84e3-fc40-4f84-aad6-2ba69cb7611c

The present invention relates to a purifying process for phosphatidylserine, the latter being prepared by trans-phosphatidylation of phosphatidylcholine with serine in presence of the enzyme D-phospholipase and containing as impurities hydrophilic compounds, proteins and inorganic salts. Tables within an existing database are searched to identify at least one candidate table that is associated with data that may be relevant to the defined content that is to be included in the new knowledge base. The mechanical venting assembly of this invention ensures that the vent openings associated therewith will not become plugged with debris.

1459828043-c7a2a757-039a-44db-bc91-7f2b71910a58

A method of identifying a cache line of a cache memory for replacement, is disclosed. The transverse elements each comprise a body part, a head part and a neck part therebetween. The charge transfer mechanism can be used together with a charged particle beam or laser system to modify small structures, such as integrated circuits or microelectromechanical system. The storage battery is coupled to the piezoelectric transducer for storing the electricity generated by the piezoelectric transducer. Lifting surfaces, such as fins, may be attached to the tail boom. Then, a sputtering film is so formed as to be continuous in an area bridging the surface of each of the chip areas and the inside surface of each of the trenches, and the semiconductor substrate is diced along lines outside the trenches.

1459828044-3a93500e-e1cb-4684-acfc-73c30d17d320

The present invention relates to high oxygen ion conducting oxygen storage materials, a catalyst employing the OICOS materials, and a method for converting hydrocarbons, carbon monoxide and nitrogen oxides using the catalyst. The robot may include various sensors, imaging devices or manipulators. The housing also has two plates depending downwardly from the bottom member and which form an inverted U-shape for mounting the device on a rim of the toilet bowl.

1459828044-50118b41-6c65-4966-83bc-a754823f6e29

Two shoulder harnesses are made from a pair of elongate flexible straps, each of which has a pair of like shoulder-engagable loops formed on opposite ends thereof and connected by a central section of the associated strap. The outer polepiece of the solenoid is provided with an axial, self-lubricated, non-magnetic bearing for closely supporting and centering an actuating shaft extending coaxially from the solenoid armature. Tie bars can be located on three main sides of the die attach pad, but not the fourth main side.

1459828044-b9ff6f4f-88e0-4b51-9bf0-aca54ac665db

An improved method for consistent updates of redundant data in a database is achieved advantageously by providing a dependency model identifying source fields and respective derived fields. A base contains an airflow generator, such as a motorized fan. Stage 1 removes the neutral lipid by extracting with neat supercritical CO<sub>2</sub> or CO<sub>2</sub> plus approximately 5% of a co-solvent. According to the present invention, the aqueous alkali silicate solution contains an emulsion solution having 8 to 10% silicone oil in relation to the quantity of binder, with

the silicone oil having a boiling point\02267250\0xb0. The actuator-generator is coupled to an elastically deformable component, such that electrical actuation of the actuator-generator generates tension in the elastically deformable component. An electron mobility and/or hole mobility within a zone of the semiconductor volume that is situated in front of the cathode is reduced relative to the rest of the semiconductor volume.

1459828044-e1c43762-e285-4565-93ce-56cf0fa3dbc0

A photoconductor that includes, for example, a supporting substrate, a photogenerating layer, and at least one charge transport layer comprised of at least one charge transport component, and wherein the photogenerating layer contains a phenol polysulfide. A processing unit may be configured to receive second data packets from the network communications devices. The invention also provides methods of modeling sequence-activity relationships.

1459828045-18983619-39fa-478d-a8cf-a870e80e378a

A communication device capable of receiving, processing and sending analog signals, characterized in that the device is coupled to the audio input/output ports of a built-in or external sound board attached to a computer, through standard audio plugs. The multiple passband filter has a plurality of poles concentrated in a desired passband of the filter. The source terminal of every transistor to be tested can be coupled to the source voltage source in such a manner that the source voltage can be measured and adjusted individually on every source terminal.

1459828045-54054004-cb68-4438-82ad-75318e4d623a

A first wiring layer in a circuit substrate structure is provided with a first inductor and a second inductor. The insulating layer is laminated to at least one layer of a co-extruded film which has been coated on one surface with a microwave susceptible material, such as aluminum or aluminum coated with a food-safe contacting polymer sealant. The container further comprises lifting means to independently propel and retract the product sticks. Longitudinal guides of the connector are received cooperating with longitudinal guides of the adapter to direct the connector into the adapter in a prescribed alignment.

1459828045-903bba8e-d39c-4046-af2a-2e8669bf7b19

A mounting bracket for an image sensing unit of a scanner according to one example embodiment includes a first portion and a second portion extending from the first portion. A galactose-containing compound is used as a carbon source for an embryogenic culture during at least one of the steps of induction, proliferation, and prematuration. The host system receives and decodes the power cycle request signal, or reads the status register, and performs the power cycle request, which can include power cycling the controller or the memory array in the NVM device, or both.

1459828046-672c56c6-264c-4558-986f-881a026bbb8d

A method and system for agent exchange-based materials handling. An amount of energy  $U_0$ , which is determined by  $U_0 U_i U_d$ , is applied to each non-ejecting chamber, wherein  $U_i$  is the energy imparted to each ejecting chamber and  $U_d$  is the energy that is carried away by a single droplet of ink, when all the nozzles are driven to eject ink at a maximum ejection ratio, with the temperature rise of ink jet head being saturated. A field weighting factor coding unit or a frame weighting factor coding unit performs respectively the coding of respective weighting factors when the respective modes are selected. The automatic exchange of settings and other information via a proximity-based RFID data exchange allows a media player to quickly establish a secure communication link with another device via a commonly supported wireless protocol such as Ultra Wideband or Bluetooth. The invention further relates to a process for preparing porous gels, to the porous gels thus obtainable and to the use of the porous gels as an insulating material and in vacuum insulation panels.

1459828046-6fec029d-b513-406a-a39f-64b0c95bed98

Fun \u201cnoodles,\u201d elongated flexible tubes formed of closed-cellular foam plastic used for play in water, are provided with decorative wiggly waggly tails at their ends, the tails being capable of new play patterns and water splashing effects. Overlapping sheets which pass the first and second separation units and are not separated are detected to be overlapped in a state that they are clamped by the nip of the drawing roller and pinch roller. If the page index of the DMA operation is less than the copy address pointer, the portion of the page that would be written to by the DMA operation has already been copied, so the DMA operation is performed to the physical address of the new page. First level shift circuits 170 shift levels of the voltages outputted from the first SH circuits 130. The memory is loaded with a first segment of code to control execution of cryptographic functions and hash functions, and a second segment of code to perform cryptographic functions on behalf of a third party having no physical control of hardware employing the cryptographic device.

1459828046-aec02b90-1a65-43dd-a773-4cb03b64b594

Disclosed herein are scintillating materials, methods for their manufacture, and method for their use. A self-healing is guaranteed by a reactive substance, which is encased in sheathed particles. A communications system including the receiver for recovering data and a method of recovering data from spread spectrum signals are also provided.

1459828046-e3b21507-8db1-4e9e-b43a-49a5b014c2ad

A pressure sensor comprises a first pressure chamber containing fill fluid at a first pressure, a second pressure chamber containing fill fluid at a second pressure, a porous dielectric diaphragm having first and second major surfaces exposed to the first and second pressure chambers, and first and second electrodes positioned with respect to the first and second major surfaces. A base station, connected to a public switched telephone network, includes a call processor, a memory and a transceiver. A luminance filter function is convolved with the reference luminance image to produce a local mean luminance reference image. The technique further involves performing a UAV remedial operation in response to the series of aileron deflection evaluations indicating abnormal aileron behavior, e. The temperature of the reaction mixture may be maintained at no more than 210\xb0 C. In one embodiment, a method includes communicating key information and cipher text generated based on the key information, or plain text, using a plurality of different, distinct and separate communication channels connected to an RFID tag.

1459828047-33b961f0-8031-4974-9976-92aa4ecac0d1

A display apparatus includes a plurality of pixels each including an electro-optic element, a writing transistor writing a video signal into the pixel, a holding capacitor holding the video signal written by the writing transistor, and a driving transistor driving the electro-optic element based on the video signal held in the holding capacitor. The first voltage is substantially equal to an on voltage of the sense amplifier circuit, the on voltage being obtained by adding an offset voltage of the sense amplifier circuit to an on voltage of a transistor constituting the sense amplifier circuit, or the first voltage is a voltage between the on voltage of the sense amplifier circuit and the second voltage. When it is determined that the specific apparatus is logged in, the function control unit permits the execution of the image processing function without the first request unit requesting the input of the authentication information from the outside. The alteration of the electrophysiological property can be accomplished, for example, by tissue ablation or by the administration of medication. These compounds inhibit the enzymes MEK 1 and MEK2, protein kinases that are components of the MAP kinase signal transduction pathway and as such the compounds will have anti-hyperproliferative cellular activity.

1459828047-dff84125-b8de-4728-8e4b-ed79e8684532

A clamping mechanism having a static plate and a dynamic plate rotatable about a transverse axis relative to the static plate is disclosed. Parse trees for the plain text are generated based on the grammar of a natural language, the parse trees are mapped on to instance trees generated based on an application-specific model. In this configuration, it is preferable that the first particle have a higher electron emission efficiency than the second particle and that the second particle be conductive. With this construction, it is possible to authenticate a person carrying the mobile terminal apparatus, and to verify whether data to be stored in the memory has been tampered with. A portion of the head support section is movable toward the head end of the mattress as the second support section is moved to an elevated position relative to the first support section.

1459828047-e68615d5-5927-4dbd-b22e-d4b2ecf4b8de

A method of enabling a knowledge management community. The memory contains a datastore. A reagent buffer tube, a reagent container and a third switching unit may be further provided between the sample buffer tube and the first syringe, or between the second switching unit and the input port of the dispensing tube. 5-12% of a thixotropic agent such as a fatty acid amide and 1-15% of an activator selected from organic acids and their amine salts, the thixotropic agent and activator vaporizing in the presence of the solvents while the solvents are vaporizing.

1459828048-3ee93fc2-545f-4149-bac5-2500edfdf5ba

The invention provides a low modulus drive belt for an automotive accessory drive system that allows for relatively high elongation during installation and that maintains a relatively high percentage of its install tension throughout the useful life of the belt. The form factor card comprises an adapter region for interfacing the card with the host electronic device, an on-card electronic device for performing a task for the host electronic device, an on-card intelligent controller, and an indicator in communication with the on-card intelligent controller to communicate an operational status of the form factor card. A through-hole is defined in at least one of the handles. In one of several alternative embodiments, a solenoid valve is added to convert electric power to activate the air delivery to outward and inward pressure airlines and to distribute the air supply between the outward and inward pressure airlines, respectively. The apparatus also has a simple construction, thereby reducing its production and maintenance cost. If so, the system triggers a remedial action, which can include: a full garbage-collection operation; a generational garbage-collection operation; or generation of a signal which indicates that a memory quota violation has occurred.

1459828048-4d56c9c6-6bdf-47ef-8433-ea5a80277cc3

The present invention relates to isolated polypeptides having dipeptidyl aminopeptidase activity and isolated nucleic acid sequences encoding the polypeptides. More particularly, the invention provides a surface-treating method of a fluorine resin suited to impart bonding properties to a fluorine resin for the laminate, to a laminate having a good property of bonding between the fluorine resin and the crosslinking elastic adhesive body, and also to a method for making such a laminate as mentioned above. A light emitting apparatus is positioned to illuminate the coin face at the predetermined station so that the image apparatus can capture an illuminated image of the face of the coin. The sensing device includes a housing and a sensor with associated electronic circuitry. The face plate insert includes a polymeric material that is disposed across the cavity and that has a tensile strength of at least about 220 MPa.

1459828048-e9c59928-b8ba-4da8-b05b-c5e63088e940

An acoustic shielding article which includes a shaped thermoplastic element that has a metal inlay element fixedly attached thereto, is described. The obstacle

detection stopping device comprises a support member, a rotary drum, a cam clutch, and a winding pulley. The top surface includes a recess formed therein whereby fuel flows into the recess from the supply passage. Span function is specific to the bending span configuration used and can change during measurement of a board.

1459828049-5ff696bc-a4b6-4eb0-b2b9-bc1aaed3c1a0

The invention encompasses protectant agents including uracil or a metabolite thereof that effectively prevent and/or treat the cutaneous toxicities and dermatological side-effects associated with chemotherapeutic agents. In the simplest implementation the switching can be on a round-robin basis, but the switching can be enhanced to prioritize and use quality of service requirements associated with each output request, and also to measure congestion at each access point and base switching upon the congestion level. The first hinge hole may be smaller in size than the second hinge hole. The system may be used in determining slow moving targets using a combination of monopulse anomaly and target spectral width measurements. This virtualization of terminal actual addresses with respect to a server improves service continuity in an efficient, low cost manner, independent of the need to modify the OS kernel in various devices. At the same time, since the preferred access is decided before the actual access attempt, control signalling can be significantly reduced, even at very high traffic loads.

1459828049-af74954d-e5b4-4150-9d6a-80a957157506

This invention is a new and distinct cultivar of a zonal geranium named \u2018Lavender Dot\u2019 the cultivar has a brilliant array of colors within the plant's light lavender pink blossom and dark green foliage on a stable, full, well branched plant. The drive mechanism includes a differential, a speed changing unit operably disposed between the differential assembly and the first and second axleshafts, first and second mode clutches and a brake unit. The client process contacts the client services process to obtain, after authenticating with it, the WAN address of the agent process and contacts the agent process to receive information or meta-data describing the media files available for streaming.

1459828049-cdd79b1f-f10d-474a-96d9-480079e59fa7

Discloses is a method for transmitting cell change instruction information, which is to be performed by a terminal in a wireless communication system. The defect induced layer has a higher crystal defect density than those of the first and second nitride semiconductor layers. This takes advantage of the inherent capacitance and inductance in the VCM, which maintains a current after the current supply is switched off. A controller is adapted to control a supply of a coloring agent from said coloring agent supply into said extrusion container in accordance with a selected brick type. Methods of coating particles with nanometer to multiple nanometer thick coatings in atmospheric pressure, and using pneumatic fluidization, are also provided. Thus, it is possible to correlate images with each other by using identification information of a user or the image pickup apparatus and identification information of an image capturing time, an image capturing position, or an image pickup target.

1459828049-ce6f4c29-7579-4c74-9dff-203b742c6719

A vehicle safety device includes a seat mounted within a passenger compartment of the vehicle, in which the seat is movably connected to a vehicle frame by a seat position adjusting mechanism that allows the seat to move along an axis between a forward-most position and a rearward-most position. Also, a tone difference between the target pixel and each peripheral pixel is detected. Via the two-way voice channel, an operator at a central monitoring station can verbally communicate with someone at the premises, for example.

1459828050-84232721-38d6-427b-9850-0b4f4380061f

The technology herein provides a dark blood delayed enhancement technique that improves the visualization of subendocardial infarcts that may otherwise be

disguised by the bright blood pool. The elements are provided with cameras and optical fibers to illuminate and inspect the barrel before lifting it. The analysis subsystem acquires crystallographic information from the workpiece after the workpiece undergoes a fabrication step by the first subsystem and then provides information, based on the crystallographic information acquired, for modifying parameters associated with the respective fabrication steps. The transformer has a primary winding. On receipt of the encrypted document, the repository's vault signs the encrypted document itself before storing the document in the electronic repository and returning to the originator's vault proof of deposit of the encrypted document. Bump electrodes are provided on the back surface of the wiring board in an array fashion.

1459828050-de1909d7-a0e0-471a-8359-0768151384a6

The present invention provides a method and an apparatus for reducing noise. The circuit includes a solenoid valve configured to be electrically controlled and to receive a fluid under a first pressure; a sub plate mounted valve configured to be hydraulically controlled by the solenoid valve and to receive the fluid under a second pressure; and a selector valve fluidly connecting an output of the sub plate mounted valve to a shearing blowout preventer and to a device. strong stimulation of the seedling initial growth. The liquid does not spread over the liquid-repellent region and is dried while moving the spherical spacer toward the center of the liquid. A first air channel is defined by a combination of a through-hole in the platform at the gap volume, and an opening in a back face of the housing. Medial advancement of the shaft into the ear canal is limited by a base, side extension, or mold coupled to a proximal portion of the shaft or other proximal part of the tool.

1459828050-fb030c35-e330-46b8-92fd-3e6f36fe5df0

The invention provides 1,3,5-trisbenzenes represented by the general formula wherein A is naphthyl, anthryl or phenanthryl group, and R is hydrogen atom or diarylamino group. The likelihood function may represent any statistical distribution. The nozzle arrangement has a body which comprises an outlet through which, in use, fluid is ejected from the nozzle arrangement and is formed from at least a first part and a second part, the first part having an inlet through which the contents of the container admit fluid into the nozzle arrangement during use and an abutment surface which contact an abutment surface of the second part. Following its deposition, the carbonaceous binder within the coating is cured to render the coating machinable, and the coating is then machined to approximately produce the net shape of the article.

1459828051-6a28ad59-b1f5-47d5-94db-9b7bdb179e33

Disclosed is a method for making a solar cell. The retaining device includes a supporting strip which can be fixed to the machine table edge and bears against the latter essentially over the entire length of the supporting strip. In various embodiments, fluocinolone formulations may be provided within biodegradable polymers to reduce, prevent or treat sciatic pain and/or inflammation. 15\xd710\mu221210 m and silica-alumina containing a quantity of more than 5% by weight and 95% by weight or less of silica.

1459828051-78d3ef14-2168-4023-83e8-0ca107e50086

A method of printing a fluorescent image on a surface of a receiver medium comprises forming on the surface by a thermal dye transfer printing process a first image of a first fluorescent dye; and forming on the first image by a thermal dye transfer printing process a superimposed second image of a second fluorescent dye, the first and second dyes having different emission maxima. A network facilitates message transactions between a requester and a responder for facilitating web services. The substrate preferably includes meta-materials. The thickness is sized to reduce the number of ring surface modes supported by the core ring.

1459828051-b3ae171d-d599-4ac7-aee2-cbd3e2c4386b

A process for initiating a highly selective ethylene oxide catalyst is provided in which the highly selective ethylene oxide catalyst is operated first as a standard Ag-based catalyst. or higher, in a simple manner at low costs without need of a large size facility and a number of steps. The print module drives the first direction-changing mechanism, which drives the first moving mechanism and hence the wiper to clean up the print head. Thereafter, a cylindrical cover member is attached to the outside of the lever base in such a manner as to cover the whole of the large-diameter portion and the substrate.

1459828051-bb8571c9-aff1-4d55-a19c-6a4c4b17232d

A hybrid lens includes a plastic lens and a glass coating film. A temperature sensor is fitted to the seal, and hence a temperature of the seal contacting with a rotary wheel can be directly measured. The verify ridge orientation characteristic map may be compared to the enrollment ridge orientation characteristic map to determine a match therewith based upon the first and second probability distribution functions.

1459828051-cc43c756-4df3-4c1b-a9e1-16ed7d7e805c

A coiled circuit device is produced by forming a circuit layer on a substrate. The method comprises forming the periphery of the inspection target structure so as to provide a progressive optical contrast transition between the inspection target structure and its surrounding environment. The arms are biased toward each other and one arm is longer than the other with a notch on an inside edge to receive the tip of the shorter arm when capturing small syringe flanges.

1459828052-094c174e-fe6c-4eb6-9034-8663b5b2ed0b

The present invention is directed to a method and system for use on a computer for the automated generation of commands or other data to populate tables of a database. First and second of these resonators have a first electrode connected to a first input of the secondary four-pole circuit and a second electrode connected to first and second outputs of the secondary four-pole circuit, respectively. To place a reference mark, a selection of a portion of a document is received. The gas stream includes a radioactive species.

1459828052-728027dc-89bf-47d0-8867-06d2d293bb66

A sensor for carbon dioxide detection may be adapted to have reduced water permeability. The multiplexer channelizes an input radio frequency band of electromagnetic energy into a set of output ports. The upper portion of the body member is designed for being positioned on an upper torso of the user.

1459828052-a60a762a-00b1-420d-a7f8-53cf0699fc30

A method, system, and medium are provided for connecting mesh devices to a wireless network. A generally U-shaped char tube has a base and first and second substantially vertical limbs. An implantable piezoelectric element receives the applied electrical waveform signal generated transcutaneously and, in turn, causes mechanical deformation resulting in mechanical vibration of the implantable piezoelectric element sufficient to stimulate the predetermined body part. A product integrity tracking system includes a movement monitoring device with one or more sensors for attachment to a product or packaging containing the product.

1459828052-bde24c26-dd2f-48cd-beb1-2710e9888c75

In accordance with one preferred embodiment, a desiccant cartridge for insertion into an integrated condenserreceiver comprises a rigid stand-off member and a porous desiccant bag. A multiple electrode set consisting of at least one reference electrode and at least one working electrode is located thereon in a downstream region. 1, and to a process for the preparation of these compounds and use as phosphors and conversion phosphors for the conversion of the blue or near-UV emission from an LED. The end of the at least one waveguide is arranged to emit

light into the at least one second capillary. An improved method of producing a polyether polyol uses the DMC catalyst to produce the polyol.

1459828053-2f54f186-75c8-4cac-8f94-d532b560c259

Methods, functional data, and systems are provided for image feature translation. The invention further provides methods of preventing or reducing the risk of a fetus or child developing an ASD by administering to the mother an agent that blocks the binding of maternal antibodies to the one or more fetal biomarkers listed above or by removing from the mother antibodies that bind to the one or more fetal biomarkers. ; a kinematic viscosity at 40 degrees C.

1459828053-35ee6b05-8a9c-4689-983b-84a4ae3f7ec9

An optical assembly includes a light directing film having an average effective transmission of at least 1. Exemplary embodiments include a HVAC system, including a load motor, a main breaker micro electromechanical system switch, and a variable frequency drive disposed between and electrically coupled to the load motor and the main breaker MEMS switch. The algorithm identifies the real IP address, and executes the dynamic web content on the browser to open a direct network connection between the server and device. A fluid communication path is defined within the adapter, allowing mastic to flow through the adapter. The rotor axially presses the seals toward the housing base until contact areas of the rotor and the housing base oppose each other and are close to each other. By identifying content resident at a number of different repositories, such a directory allows cell phone users to identify the diversity of sources from which desired content can be obtained\u2014some available on a scheduled basis, others available on demand.

1459828053-5d37d33b-c80c-40e7-91d2-69511d6b5599

A visual server system includes a visual server that provides graphics images through execution of a graphics application. The turbocharger includes a compressor having an outlet fluidly coupled to an intake manifold of an internal combustion engine and a compressor outlet, a turbine having an inlet fluidly coupled to an exhaust manifold of the engine and an outlet. The pattern includes a first region being in the form of a localized on-grid array and a second region where at least one of the features has an increased width. A layer of adhesive is provided on the bottom surface of the base, but not on the under surface of the radially extending member. With the heat-transfer suppressor, the thermal diffusion from the high-temperature reaction section to peripheral area is effectively suppressed.

1459828053-ab90dc56-419c-4796-8142-78ec85297401

A slider is formed of a two-phase material having a first component and a second component that is harder than the first component. When an excessive number of errors are detected in an Ethernet port, a device enters a Links Off mode from a Transport mode where Ethernet ports are turned off at both ends of a circuit associated with the errors. Therefore, the user who works while seated and thus may have a high practical need for spinal stretching may simply stretch his/her spine even during work, without being restricted in time or space, leading to the effect of treating and preventing spinal disorders such as herniated lumbar disc and scoliosis caused by the long-term use of a chair. The at least one flange segment is arranged for enabling a cog belt to be configured onto the pulley without interfering with the at least one of the flange segment. Delivery of the ball to the housing, and delivery of compressed gas to expel the ball, requires only one moving part, namely the valve assembly revolving in the chamber. The butt portions of adjacent tensile strength bodies are longitudinally shifted relative to one another in a circumferential direction of the rubber crawler, and at least 75% of the butt portions are positioned on planes of projection of the core bars.

1459828054-a56ad655-35b8-4816-8a26-1ca3c7f3eab2

A production machine that allows a machine user to accurately and simply determine a parts code for a desired part in order to replace a defective or exhausted part.

In a rotor of this type, a crack-free welded joint is achieved by the fact that, to join the two rotor sections, a transition region is arranged between the two rotor sections, which transition region is produced by powder metallurgy, is welded to one of the two rotor sections at least on one side, and on this side has the same composition as the rotor section to which it is welded. The multicomponent fiber is capable of being drawn at a relatively high fiber speed, particularly at least about 2000 m/min, and may be used to produce microdenier fibers. The treatment of SRB with both a biocide and a metabolic inhibitor provides effective biogenic sulfide inhibition at significantly lower concentrations than would be required if the biocide or metabolic inhibitor was used alone. The method may also modify the model based on exception conditions. Accordingly, a pattern including a non-periodic portion finer than a resolution limit of an exposure apparatus is formed.

1459828054-d1a0db4f-56e7-4148-8c37-cc68e06d79fe

A method for facilitating electronic certification, and systems for use therewith, are presented in the context of public key encryption infrastructures. A printing method includes generating a plurality of types of drive signals, and ejecting the dark ink and the light ink from a head, an amount of each ink varying for each dot tone value. When the apparatus is operated in a disc destruction mode, the shared second shaft is rotated in an opposite direction than the paper shredding direction and interleaves with the stationary structure to at least damage an optical disc fed through the disc receiving opening. A portion of the cap layers in a second region of the substrate are removed so that the cap layers have a thickness smaller than or equal to the buffer layer. In one embodiment, the level 3 network is used to carry configuration data for the MCPEs while the broadcast network is used to carry configuration data for the level 3 network drivers and switches. The actuator blocks are arranged in a zigzag pattern so that adjacent actuator blocks are spaced apart from each other in the scanning direction while partially overlapping with each other with respect to the head width direction.

1459828055-2da719c3-2da2-406f-8df3-75b683d9fb4f

A combined spring brake modulating relay valve integrates the functions of a relay valve and a modulating valve. The blends of carbon black or other fillers are preferably pre-blended prior to introducing the blend into a product such as an elastomeric or polymeric product. A plurality of conductive terminals having terminating portions are respectively terminated to the distal ends of the conductors. The first drive mechanism is provided to the main body and configured to cause the first movable unit to be displaced in the second axis direction with respect to the main body to generate a moment about a third axis to the holding unit. The side slip angle velocity is integrated, preferably with an anti-drift integration filter.

1459828055-68101541-44c7-4dee-8291-a79d890b7c3e

An article of footwear with a detachable wrap is disclosed. A data driver divides input digital data into a number of digital data under control of the controller, converts the latched digital data into a number of analog data, and then simultaneously samples the analog data to supply to the data lines. The screen capture application may store the components as a plurality of layers within a layered image file.

1459828055-72b9b4ad-93b4-4971-8340-5393de1d6d4b

A method for imaging a desired coronary artery or desired portion thereof is provided. The prober replacing device has a conveying device for conveying a prober for inspecting a liquid crystal substrate. The heat sink includes a central cylinder and a plurality of fins spaced from and surrounding the cylinder.

1459828055-b8c4c48d-a77f-482e-a3b2-b2fb0e0d20d2

The invention relates to a method for controlling an actuator which can be displaced between two end positions, said actuator being impinged in one end

position and being capable of displacement to the other end position by an electromagnetic part. The receiving module receives a desired weight value to correct an imbalance of a wheeltire assembly. The oscillating device is connected to a second con rod connected to the crankshaft for relative rotation on a second axis parallel to the first axis, and also to the first con rod for rotation on a third axis parallel to the first and second axes. The basic raster is then superimposed on a fine microraster in such way that the area coverage of the basic raster is reduced by a percentage which can be set between 0% and 100%.

1459828055-e2e20c3c-3524-41f3-a90d-c4d206a3a88e

Described herein are antibacterial compounds of formula I, methods for making the compounds, pharmaceutical compositions containing the compounds and methods of treating bacterial infections utilizing the compounds and pharmaceutical composition. A memory system allowing fast and efficient data transfer can be achieved. , cutting or puncture from a shovel. The mass damper can move relative to the frame of the reel mower by shearing the elastomeric material forming the couplers. Meanwhile, the the 3D data in the z-axis direction is Fourier-transformed and rearranged on a kx-ky-z space, a two-dimensional Fourier transform is performed on the z-data completed in a kxky direction and a 3D image is acquired for real space.

1459828056-26b95d28-2337-4668-8412-92c24dc12cdd

Hardware of each of controllers for controlling a plurality of instruments to be controlled, which are provided in a reach stacker as a heavy duty industrial vehicle, for example, a vehicle body, a spreader, and a cabin, is rendered common. An extension layer is coarsely divided into a system for processing a first channel and a system for processing a second channel. In one embodiment, the method includes a first component of the data center receiving first and second requests. The voting circuit then determines a bus inversion values based upon whether the number of bits on the data that have changed exceed a value that depends upon the indication of bus width. In particular, 3-aryl quinoline compounds, their synthesis, pharmaceutical compositions thereof and methods of treating infectious diseases such as malaria, are disclosed. The transmission speed detector detects data transmission speed information between a host and the scanner.

1459828056-4953be46-724d-44dd-9fa6-d619337891d7

A transmission apparatus for a working vehicle comprises a hydrostatic transmission, a sun-and-planetary gearing unit, and an auxiliary speed changing system. The two parts fit together so that a developer roller in the toner part contacts a photoconductor drum in the other part. A first emitting layer and a second emitting layer are sequentially disposed on the anode. The signals define event content and non-event content. The technology facilitates analyzing user input to identify a d\xe9cor style from a d\xe9cor style dictionary, obtaining d\xe9cor that harmonizes with d\xe9cor style, and presenting a representation of the d\xe9cor to the user.

1459828056-5481c6b0-90b3-4066-a30d-46351aa1b745

An improved multi-port memory cell circuit which has a smaller number of write lines and/or transistors than conventional multi-port memory cells, and hence occupies a smaller area, is provided. Preferably, the absorbent interlabial device has a liquid pervious topsheet, a liquid impervious backsheet, and an absorbent core disposed between the topsheet and the backsheet. During a calibration phase of operation the converter inputs receive first and second different codes representing the same output level.

1459828056-b30965cd-66c4-42c5-b53c-7628987cfda9

The telephone memory aid provides a database to a primary party for storing and retrieving personal information about a secondary party, including summary information related to communication exchanges between the primary and secondary

parties. The machine elements can easily be separated by hand or with simple tools and inserted individually, for instance into the needle tracks of a knitting machine. Height adjustability is possible because the rectangle-shaped component has a series of holes bored vertically into the two faces that will contact the interior faces of the L-shaped component.

1459828056-ed8e5279-1817-4665-8b94-97a572382e4d

An optical transmitter of a subscriber optical interface and an optical receiver of a laser transceiver node can be designed to a frequency of data that is formatted according to a predetermined network protocol, that is encoded with a predetermined coding scheme, and that is transmitted according to a predetermined data transmit timing scheme. The bioconjugated composition has improved properties compared to colstrum compositions that are not bioconjugated with a hydrocolloid agent. The reversion of gray scales that occurs when the address light is increased as high as the sustain light can be eliminated to achieve correct gray-scale representation. The cover member is removably attached to the side walls by being slid into and out of the guide tracks from a longitudinal end of the side walls outboard of the side sheets for an auger clean-out procedure. The thin sheet metal of the housing has an average thickness of maximally 0.

1459828057-0cb04f5f-35d9-4362-b35f-094f4aea0218

A data processing apparatus and method for converting a number between fixed-point and floating-point representations. In one embodiment a first message comprising a first value and an address is generated. The invention additionally relates to textile machines and thread feed devices equipped with such a thread brake. A dummy stack ring is formed around the memory array. The bill acceptor assembly includes a validator assembly capable of accepting a stack of individual notes in a receiving slot mounted to the gaming table, processing the notes one at a time, and passing valid notes through a hole in the gaming table or along the back edge of the gaming table to a cash box located below the gaming table. In one embodiment, an electronic device comprises a processor and memory controller logic to determine a memory refresh frequency for a memory system and transmit refresh commands to a refresh control logic in at least one memory bank coupled to the memory controller according to the memory refresh frequency.

1459828057-3bd035d1-d826-48c2-825f-f17a1fb1c84e

A microprocessor configured to receive and process digitized signals derived from an analogue ECG signal is provided. The radius of curvature of the bearing pin journal and cone bearing surfaces are matched or conformed on the bearing pressure side. Each fan module may contain water injection piping and nozzles, which allows the fan cooling system to dispense fog. The light emitting polymer materials are deposited using flexographic mats, the relief portion of which have patterns corresponding to the respective portions of the glass substrate being covered by the light emitting polymer materials being deposited. The alloy fill is formed by electroplating the Cu surface in a unique chemical solution containing salts of Zn and Cu, their complexing agents, a pH adjuster, and surfactants, thereby electroplating the fill on the Cu surface ; and annealing the electroplated CuZn alloy fill ; and planarizing the CuZn alloy fill, thereby forming the dual-inlaid copper interconnect line.

1459828057-4c0e569f-bb56-410f-a740-91152992b6f9

A lenslet array having lenslets where the lenslets are variously shaped, and/or rotated and/or tilted, reducing gap images in an image formed by pixelssubpixels, where the pixelssubpixels have gaps between each other forming the gap images. The sensor data comprise measuring point set measured at different time points, and the movement of the object is determined between different measuring point sets. In some aspects of the method the semiconductor buffer layer is formed from YBa<sub>2</sub>Cu<sub>3</sub>O<sub>7-X</sub>, indium oxide, or ruthenium oxide, having a thickness in the range of 10 to 200 nanometers. In addition, the apparatus has at least one adapter moveable element

retained within a passage located on the knob and least one drive spindle moveable element retained within an additional passage located on the knob. The tubular portion splits the flow of air running along the radially inner wall into an inner air flow passing between the tubular portion and the inner flange of the chamber, and an outer air flow passing between the radially inner wall and the tubular portion. Finally, a computer program product comprising a computer usable medium having computer readable code embodied therein for producing images of a virtual three-dimensional book is also disclosed.

1459828057-8ac041d5-91fc-4c32-ac83-6697b5d6fa89

In a system for providing customers with information assistance services, records are generated to register service events. The reactor comprises at least a first feeder and a second feeder on one end of the vessel. A power cord is also provided, which remains physically spaced from the electrical outlet socket. A memorabilia compartment is formed within the cap and includes an access opening and an interior. The fastening portion is inclined with respect to the first end portion by an angle  $\theta$  corresponding to an angle of separation of the ear lobe bearing the earring with respect to the cheek, forming a bend, so as to put the earring straight with respect to the cheek. The scanner software application also constructs an output image that can be printed, saved or communicated.

1459828058-a39164b6-9719-4950-aef5-466f299e517a

Fluid separation assembly that allows easy and fast change-out even in confined spaces, and also minimizes or eliminates leakage during change-out. A first subcircuit has the first input set, logic generating control output signals, each control output signal represents whether the first input set has exactly a predetermined number of high input signals. A power estimator processes the signals from the microphones and the first beamformed signal from the first beamformer in order to generate, in frequency bands, a first statistical estimate of the energy of a first part of an incident sound field.

1459828058-f138afee-969f-4009-bdbd-e5f31e80c989

The invention provides a structured material composed by including a noble metal, in which an oriented layer is formed on a layer containing a Group 4A metal. A universal translator is provided to interface between individual system components that exchange data in a seamless manner between legacy data formats and specific data formats advantageously employed by newly-developed, procured and installed individual component systems. The composition can also take the form of a troche, a candy, a wafer, an orally disintegrating tablet, a sublingual tablet, a buccal tablet, a buccal patch, an oral dissolvable film, an aerosol or spray, a lip balm, and chewing gum. In this manner, the laser is continually being used to mark semiconductor chips without having to wait for unmarked chips to move to the marking location. The pressure chamber comprises an orifice in a wall of the pressure chamber; and a check valve corresponding to the orifice, the check valve configured to allow gas that results from ignition of a propellant to enter the pressure chamber via the corresponding orifice and to prevent the gas, once inside the pressure chamber, from exiting the pressure chamber via the corresponding orifice. The mobile device may be configured to scan for a wide variety of tags, including tags in the form of quick response codes, steganographic content, audio watermarks, audio outside of a human audible range, radio frequency identification tags, long wavelength identification tags, near field communication tags, and/or a Memory Spot device.

1459828059-23c69f8b-83fc-4f63-8fa2-80c02e403a99

Disclosed are a method for manufacturing a positive temperature coefficient device and a system for preventing overheating of a planar heater using the same. A first dielectric layer and at least one first conductive layer are included on the substrate. The inventive particles are made of an inorganic material comprising oxygen, in particular an oxide, said material having an adequate density, and can

be activated in vitro, ex vivo, or in vivo, by controllable external excitation, in order to disturb, alter or destroy target cells, tissues or organs. The all-solid planar sensor cell has two or more film type electrodes arranged on a non-conductive planar surface of a supportive material. In this manner, the system provides improved access, storage, and on-line availability of digital images. The method may comprise varying radiation absorption by varying the intensity of the radiation incident on the surface portion of the layer, or alternatively may comprise varying the radiation absorptive properties of the particulate material over the selected surface portion of the layer, for example by printing a radiation absorbent material onto the surface portion.

1459828059-551b3736-b776-451a-9e2b-953db2a1d149

An inkjet printer system includes a print head, a sub tank, a pressure controller, and a check valve. The device can be any type of physical object and includes an address pattern statically printed thereon or generated in the background of a display. The keyboard is connected by links to the platform for the monitor so that when the keyboard support is pulled out for use the monitor is moved into an operative position from an inoperative position in which it is out of the way. By averaging a plurality of polarization states within a channel, PMD can be estimated for compensation. Where LRL is about equal to LPL and DWKG is selected such that the PLI gets focused by the FLRL into the ILI at the FLIS top surface with an imaging magnification factor of about 1:1. Component is uniformly dispersed in the composition without forming coarse agglomerates to secure low stress properties.

1459828059-9d96711a-9048-428d-a11a-e81061b86cae

Aspects of the invention relate to intracranial electrodes and methods for implanting and using intracranial electrodes. The position of the visible portion of the page of information on the display is constrained if the motion does not exceed the threshold. The body includes an outer surface, a tapered inner surface, and a vertical portion. A feed mechanism that varies the printing medium advance rate to allow printing at below threshold velocity while maintaining a high average feed rate is described. The covering member includes an upper plate and a second sidewall that protrudes from an edge of the upper plate.

1459828060-499a29c8-cca1-4a0b-ac62-e4ab44fd7278

A method for controlling wafer uniformity in a polishing tool includes providing a plurality of carrier heads, determining a signature for each of the carrier heads, and installing carrier heads with similar signatures in a polishing tool. The at least one shut-off flap may selectively allow the product to be dispensed from the outlet orifice. Once the received reflected power rises or falls to the threshold, the emitting power is not further increased or decreased respectively, but is maintained constant. In consequence, in the X-ray CT apparatus provided with a slip ring, the wear debris produced in a contact space between the slip ring and a brush can be prevented from being scattered in the apparatus. Also provided are methods for expressing amplified siRNA expression cassettes in cells. A protective layer is formed over the stack.

1459828060-acd0b6c5-582e-4915-84a4-fdd2d4a6a552

It is an object of the present invention to provide a protein that can successfully treats almost all patients with cedar pollinosis and can be ingested as a food. The injectively-mixed backmixing reaction chamber induces alkyl free radicals prior to input to the tubular-flow reactor. The IQ phase imbalance detection and correction circuit equalizes for the relative phase imbalance and the IQ gain imbalance detection and correction circuit equalizes for the relative gain imbalance between the I and Q channels created by the analog portion of a quadrature receiver. The gradient index rod lens has a lens length larger by 0.

1459828060-fb3fd88f-aa70-415c-83ee-20daeb52b904

A banking system that utilizes metrics in acquiring and processing event data

related to financial transaction activity at a plurality of automated banking machines. Various optimizations which may be used individually or in combination to minimize the potential disruption to the viewer. The sheet delivery device delivers the sheet conveyed by the sprockets and delivery grippers. The contraction portion accelerates a first portion of the airflow directed toward the second portion of the disk of the hard disk drive.

1459828061-11e78ae6-6a8b-424e-9473-fd7eae85cdeb

A method and system for automatically identifying and tracking a ROI over all planar acquisition view angles of a nuclear imaging system, such as a gamma camera used for SPECT or planar imaging. The pallet has a set of openings corresponding with features of the mobile drive unit. The received management information is converted into a specified format, and the converted management information is then sent to at least one management application in conjunction with the sending of presence information to the at least one management application. Next, Bayer pixel averages and Bayer pixel differences in horizontal and vertical directions of the color filter interpolation case are obtained.

1459828061-c5787743-7241-4693-89e4-086396dae960

A set of tools for removing a half turn of a coil from a slot of a dynamoelectric machine. The upper end of the sheath is held in place within a channel formed in the feed filling funnel. Each layer, from a lowest hierarchy level to a top level, provides relatively increasing selectivity and invariance of the input image.

1459828061-ecbece8b-463b-4f57-b837-2723ac6ab7e9

A photo-radiation source for the selective polymerization of photo-radiation-curable organic material. The rotary wheel is mounted in the inner surface of a ring-shaped frame. At least one annular reinforcing zone is incorporated in the body of the liner.

1459828061-f03b679d-ee5d-4df8-b51e-7b6791bb145b

A fiber gain medium assembly is provided. The method further includes converting the caller identifier information into caller identifying textual information, and inserting the caller identifying textual information into the digital video stream using a visual timecode video insertion format. In other arrangements, a track assembly includes two nested tracks, an inner track and outer track.

1459828062-57496178-0618-4df6-a099-199668321125

A method and system are provided for downloading software components from a remote source to a software application for providing updates or additions to the application's functionality. The degassing structure comprises a sliding member for receiving the pushing force of an elastic member from the bottom side, and a sliding member acceptor for accepting the sliding member slidably in the vertical direction. Each of a plurality of human interfaces may be coupled to one of the plurality of computing systems by a communications link. The structure further may include a n-type electrode provided on a side of the upper surface of the n-type layer; a first back electrode provided at one side of the back surface of the insulating substrate; a second back electrode provided at the other side of back surface of the insulating substrate; and an optical element packaged on the base substrate. When an IM conversation is completed or a window is closed for the IM conversation; the IM conversation is automatically saved. Furthermore during transient operating conditions, the dwell angle TDWLLB is also increased and the correlation of the ignition timing control with respect to a suitable ignition timing is improved.

1459828062-69be14d3-fa4d-4c4b-b67a-c29836fee333

An improved driving circuit for piezoelectric lamps includes a power switch unit and at least one piezoelectric transformer. Identification and classification of intuitive hand configurations and motions enables unprecedented integration of

typing, resting, pointing, scrolling, 3D manipulation, and handwriting into a versatile, ergonomic computer input device. Then, it is not necessary to provide a circuit for measuring electric resistance between the sensor electrode and a workpiece as a conventional way, thereby avoiding complexly structured plasma detector.

1459828062-6b3d6037-0276-408a-8a03-4c954943963a

An object of the invention is to provide a semiconductor device having improved performance, high reliability, and a reduced chip size, in particular, to provide a semiconductor device having an MOSFET over an SOI substrate capable of maintaining its reliability while controlling the potential of a well below a gate electrode and preventing generation of parasitic capacitance. The drawer comprises a sink which is disposed in the drawer proximate the top of the drawer near one side of the drawer and the sink comprises a fold-down faucet, valves and a drain. The first surface of the semiconductor substrate includes a top protective layer that has a surface portion extending beyond the edges of the semiconductor substrate. The wafer processing region is located between the outlets of the hollow cathode cavities and a surface to be etched. The devices may be used in a location system to provide known reference points to a network of other devices. The second clock is set to the phase position corresponding to the sampling point such that data may be recovered at that sampling point.

1459828062-f2b0c5ed-66ad-4934-b9bb-439de5d8420d

Disclosed is an apparatus for making tubular-shaped membrane electrode assembly. In the panel, an upper substrate and a lower substrate are opposed to each other and have a plurality of discharge cells therebetween. In another aspect, microfluidic substrates have channels which varying in cross-sectional dimension so that capillary action spreads a fluid only within a limited portion of the channel network. Therefore, it is possible to reduce the other optical aberrations such as distortion and simultaneously to design the imaging lens so that the astigmatism takes on a maximum value at the outermost portion.

1459828063-0c9af16e-85ca-4b3e-8968-946957ab57d4

A technique for producing compacted graphite iron utilizes agglomerations, such as briquettes or tablets that include a sulfur-containing material such as iron sulfide. The filter bag is releasably attached to the mounting assembly by a plurality of suspension elements that suspend the filter bag from the mounting assembly. In addition, the process involves returning acetaldehyde separated from the crude ethanol product to the reactor. Internal activation of carbon catalyst is accomplished by recycling of hydrogen-depleted gas containing unsaturated and aromatic hydrocarbons back to the reactor. The cable comprises a plurality of conductive cores electrically connecting the tail portions of the contacts, respectively. The test station may be a mobile test station.

1459828063-4fb1df53-ebf9-4dbe-b04b-a9f3f180b151

Aspects of the disclosure provide an integrated circuit that is configured to have an increased yield. Note or musical score marks of a same performance part can be displayed across two musical staves, by determining any one of the plurality of musical stave rows where the note or musical score symbol is to be displayed in accordance with the attribute information. With this method, the server authenticates from these two terminal IDs according to the ID fields of the old and new versions, and additionally updates the ID in the old version to a new one. Predecoding is performed in parallel with translation of the linear address to a physical address by translation lookaside buffer logic. The job may be submitted to the selected computing system to have the software application run the job to completion.

1459828064-07acf25d-20cb-4619-beae-e4bf88d2eeae

A method for correcting reciprocity error in two port network measurements, in

which an iterative algorithm is used to obtain an optimal symmetric matrix approximation to a measured 22 reciprocal network. The apparatus includes a heater element for providing heat flux, a member disposed on a surface of the heater element for receiving impinging cooling air. A first dielectric layer is preferably placed on the components, thereby embedding the components in the structure. A partner loyalty account balance is updated according to the standardized loyalty unit debit obtained in the step of calculating. In accordance with the present invention, at least one of the two components is upconverted to a frequency  $f_2$  hz and is then added in a non-overlapping manner to the other component with the result that all modulation information is conveyed by a single signal. One system comprises a plurality of portable modules for the incident scene and configured to transmit wireless signals.

1459828064-47727d88-ce77-48ab-9bed-a048979e6940

A marine lamp includes an LED and a heat sink that removes heat from the LED. These oxide particles may become inclusions that limit low-cycle fatigue life of parts. The first routing device may advertise status information for itself and/or for one or more other intermediate routing devices. A capacitive sensor mounted on the vehicle and connected to the controller provides an output signal to the controller indicative of the presence of a foreign object in the path of the closure panel. The anchor plate includes at least one generally planar body portion having a first set of mating apertures adapted for alignment in registry with the first set of fastening apertures of the web. The source produces a probe pulse in a probe state having components with different photon numbers, and each matter system has at least one state that interacts with photons in the probe pulse to introduce a change in a phase space location of the probe state.

1459828064-899b55ec-6cb5-400a-a8f9-351137d7b258

An oil lift pocket for a bearing surface having a plurality of channels in communication with a supply port. In one particular example, an individual is identified who is genetically susceptible to becoming schizophrenic. For each storage controller, the execution throttle levels for those servers that have logical ownership over logical storage units of the storage controller are verified according to rules governing the command throughput of the servers and the storage controllers.

1459828064-a95781bd-32c0-406e-9fd2-353e2d1b5efc

The invention relates to a surface layer which comprises a plurality of layers, of which one layer is a ceramic wear-resistant layer and another layer is a transition layer to a metallic substrate element. The NGOX layer may be over a silicon substrate. Access to that real time pricing information is obtained by individual users via a distributed computing network or radio frequency broadcast system and utilization of those resources is then locally controlled based upon that pricing information. The TRIC instruction determines whether the run-time-instrumentation controls have changed. A method of fabrication is provided. The coating material has air-filled glass spheres therein.

1459828064-f907f324-910a-41eb-992a-e3ade6e2128f

A passenger accommodation unit with a deployable bed includes a passenger seat and a passenger bed positioned relative to the seat and adapted for movement between a stowed position in which the bed is upright and adjacent to the seat, and a deployed position in which the bed is horizontal for use and overlaps and is supported in part by the seat. The digital image comprises pixels arranged in a color mask of at least three different colors. The memory and the computer program code are configured to, with the processor, cause the apparatus to determine a mobility state of the apparatus, and collect and store measurement data in the memory depending on the mobility state.

1459828065-f226402d-1908-41ed-abfb-aa787fe1bd92

A protective device for use in the protection of at least a portion of an elongated article which includes a main body, first and second parts which are connectible together such that, in an assembled position, the main body has a chamber therein. ; an aromatic epoxy resin having 3 or more epoxy groups in one molecule and an epoxy equivalent of 200 or less; a phenol type curing agent; one or more resins selected from the group consisting of a phenoxy resin, a polyvinyl acetal resin, a polyamide resin, a polyamideimide resin, and mixtures thereof, and having a glass transition temperature of 100\xb0 C. The last value is relevant to debugging of the computing system when the computing system fails to perform as expected and/or as desired. The receiving channels in one direction of curvature follow the curvature of the structural part of the first type. The path metric calculation unit calculates the path metric values from the branch metric values, a path metric value being an indication for the likelihood that a sequence of samples corresponds to a sequence of states.

1459828065-f5764735-d056-4f1f-8643-c383d3f2ad75

The invention relates to peroxide compositions comprising a reactive diluent for the peroxide, wherein the diluent is either a component containing one or more vinyl ether group and having a monomeric structure according to formula 1,  $\text{R}_2\text{C}=\text{CHOR}$ , or is a suitable resinous compound comprising, in a covalently built-in manner, a component containing one or more vinyl ether group. A U-shaped tubular member includes a medial portion rotatably secured in the mount, and arm rest cushions secured to opposed side arm portions. The notifying unit notifies an optical transmission device at the upstream side of a control frame that includes the value and that includes information that indicates the execution state of the optical power control. The detection module detects a rise time of the first enhanced pixel signal. A field plate is formed in the field plate trench, wherein the field plate is electrically isolated from the sidewalls of the field plate trench. The negative active material may improve capacity and lifespan characteristics by inhibiting volumetric expansion of the silicon-based alloy.

1459828066-2b42aad5-86b5-4332-b9b4-8507eaf0c238

Method and system for improving the security of storing digital data in a memory or its delivery as a message over the Internet from a sender to a receiver using one or more hops is disclosed. The present invention provides a method of modeling dynamic relationships by inputting data related to the collaborative relationship into a model, which comprises a plurality of components key to the collaborative relationship. The cartilage map can be correlated to a movement pattern of the joint to assess the effect of movement on cartilage wear. One example binder comprises the reaction product of bisphenol A and a molar excess of an aldehyde, such as formaldehyde. The method includes providing a deliquescent ion implantation source material and mixing the deliquescent ion implantation source material with an organic liquid to form a paste.

1459828066-8c003bb1-8ee6-44b0-923f-385e5d06c800

A safety propeller for a boat motor includes an annular collar having a front opening, a rear opening and a continuous peripheral wall. The boom includes a first end pivotably coupled to the base and a second end positioned away from the base, the boom being pivotable about a boom pivot axis extending transversely to the boom proximate the first end. These steps include minting and distributing the chip card, establishing that the key pair and card are given to the right person, and creating the certificate library. The cable is coupled to a point in the display assembly and to an area of the base. Detection of a person passing near a zone detector may cause a staircase illuminator to illuminate a staircase area. The chemical compounds are preferably ionic liquids.

1459828067-8780ec51-97fb-4955-8bf6-cd8483400ad5

A method for producing a light-emitting diode device includes a step of preparing a sealing layer by sealing in a light-emitting diode with a sealing material; a step

of preparing a fluorescent layer by allowing a phosphor-containing resin composition containing phosphor and silicone resin to reach its B-stage; and a step of bonding the fluorescent layer to the surface of the sealing layer. A future event associated with a first user may be determined, and a second user that is associated with the first user and the future event may be identified. In the device, the switch is turned on or off depending on data held in another latch located adjacently in a direction of the word lines, to control a connection between the bit line and connected to another bit line the amplifier via the circuit. At this gap, end portions facing each other at the gap are connected by connecting means in such a manner that left and right spaces between the surface-side skin material and the back-face-side skin material communicate with each other. The first wire 18 is coupled to the first metal 14 and the second metal 16 so as to be sandwiched therebetween.

1459828068-62af3e61-0057-475a-99aa-05dfad40f7d2

A module with a radio transceiver device, an actuator, and an activation device. This business object model facilitates commercial transactions by providing consistent interfaces that are suitable for use across industries, across businesses, and across different departments within a business during a business transaction. Upon receiving a request for admission to the peripheral bus from an additional resource, a utilization value representative of the extent to which the plurality of resources utilizes the guaranteed bandwidth on the peripheral bus is obtained.

1459828068-af152d26-374b-4bab-93db-90692645c6d0

The present invention relates to laser ablation microlithography. The system includes a passive actuator component, a first hose, a second hose, and a driving component. This serves as a barrier to temporarily block a restorative substance from passing into an inter-proximal space. The distance from an interrogator to the tag is determined by transmitting two signals from the interrogator that propagate at different velocities. The bandwidth of the received signal may be limited utilizing one or more of: a low pass filter, a bandpass filter, a high pass filter, a differentiator, or a series capacitance on the chip. A modulator-demodulator receives a modulated carrier signal from an input connection.

1459828069-3fb67cfd-fce5-44ff-8abc-561434a5b696

Compositions comprising a blend of an inorganic base, an organic base, a monofunctional organic nucleophile or a multifunctional organic nucleophile and a thermoplastic hydroxy-functionalized polyetheramine can be formed into films and laminate structures by using conventional extrusion techniques. The integrated circuit card includes a memory that stores an interpreter and an application that has a high level programming language format. The valve is further capable of functioning on a small scale with automatic sampling equipment.

1459828069-4ac68930-457d-476a-aac8-d337bc4c7ce1

A collapsible entertainment system for integration into the passenger compartment of a motor vehicle includes a frame adapted to be pivotably mounted to a passenger compartment component and a display. Additionally described is an acidic formulation comprising the inventive microcapsules and the use thereof for the aforementioned purpose, and a corresponding process. At least two of the main valve connections are in connection with the valve chamber in each valve member position of the main valve member. Pushing the connectors together shears interface adhesion between the connectors, making it easier for the operator to pull the connectors apart. The traffic may be shifted based upon voice traffic types and data traffic types.

1459828070-6e63c449-7230-4378-81ea-818ecf1108c2

An apparatus is provided for a valve assembly comprising a valve body, a valve element, an actuator housing, an actuator, an unlocked storage opening, a locked

storage opening, and a lock. The method operates on an ordered set of input symbols and includes generating a plurality of redundant symbols from the input symbols. An electromechanically operating force measurement sensor is arranged at least in the region of one of the abutments such that a tensile force is transmitted from the end of the first pulling means via the force measurement sensor to the first abutment and from there via the second abutment to the second pulling means. The retaining wall block may be cast in a mold box whose depth and width are configured and arranged to substantially approximate the depth and width of a standard sized pallet. The cover can be detached from the housing either by a movement of the latch member driven by the return member or by another movement further compressing the return member. The CRC circuit includes a first shift register to a p-th shift register, a first EXOR to a th EXOR, and a switching circuit.

1459828070-b656e2e9-15b4-418e-bd98-1c8d6a7d2a65

A card and business form assembly and method for making same. In this manner, highly flexible bit sequence generation that can be easily managed by a microcontroller occurs, resulting in a shorter code length, a faster execution time, and ease of reuse in different devices. A strip extending across the panel down from the upper end.

1459828071-65cac1a1-340c-4a47-8da1-5c97ab8d1a71

A method of protecting a SONOS flash memory cell from UV-induced charging, including fabricating a SONOS flash memory cell in a semiconductor device; and depositing over the SONOS flash memory cell at least one UV-protective layer, the UV-protective layer including a substantially UV-opaque material. The graphics memory system comprises a memory controller, which receives a batch of pixels from the graphics display system when a 3D rendering mode is in effect. These thickness variations between the ground reference plane and the signal layer inject undesirable characteristic impedance variations and undesirable mechanical variations in thickness and surface topology.

1459828071-79ed0489-2e94-45f8-af21-d89086fa312f

A method of generating a projection beam for projecting an image includes collimating the projection beam and filtering infra-red or ultraviolet radiation from the projection beam after the projection beam has been collimated. The blade has an integral platform with: a convex fillet merging with the airfoil; a forward edge; an aft edge; and a thickness defined between a top surface and an underside surface. It also provides a more flexible and efficient way to attach a lens to an aircraft. The capacitive trans-impedance amplifier section periodically reverses the voltages across the sensor, and the capacitive adjustment section, after blanking a feedback capacitance that is used to integrate excess charge caused by a difference in capacitance. The invention is also directed to a corresponding computer system and a corresponding computer program product.

1459828071-d1b63b68-a9e3-4602-a3bb-51aedcd60d03

Pyridine and pyrimidine compounds, and compositions containing them, and processes for preparing such compounds. The system includes a switch manager and a plurality of message stores. The server deploys administration agents on the computers in the network for performing various administrative tasks. A plate has a first and a second face, the plate defining a slot for the reception therein of the head of the stud.

1459828072-0aed3f08-f187-4297-83f1-9ca62e0ce302

A semiconductor wafer is manufactured in such a way that a main surface of a semiconductor substrate is partitioned into a plurality of semiconductor element forming regions defined by scribing regions, wherein at least one pattern for measuring a width of a cut region and its positional shift is formed in proximity to a peripheral portion of the semiconductor substrate on a scribing line. 2 percent to 20 percent of the weight of the particles, accelerating the curing when

needed by heating, radiation, or additional chemicals to speed the cure, and continuing to agitate the mixture in the mixer until the coating is cured. Subsequently, the actions index may be used to suggest actions based on similarity of the stored characteristics to those of a current user and/or actions. This coupling provides thermal stability to the free layer magnetization and ease of switching and the coupling may be further enhanced by inducing a shape or crystalline anisotropy into the free layer during formation. Also, when a conference must relocate, actions associated with relocating resources are automated and confidentiality concerns can be taken into account. Receiving and transmitting may be performed in time division duplex mode or simultaneously.

1459828072-53edc05d-4a3b-4e35-aae3-c1e5d7c0bf79

The present invention discloses a pointer generator which generates pointer values for a stack. ACKs are generated using a finite state machine. The positioning member is positioned by an object and the driving rod is driven by a crank.

1459828072-6c63a949-e40d-43a2-bad0-6218a63c5adb

Intake air/exhaust gas flow control is performed in a partial load range of an engine such that burned gas which is discharged from an exhaust stroke side preceding cylinder of a pair of cylinders having an overlapping exhaust stroke and intake stroke is introduced into an intake stroke side following cylinder through an inter-cylinder gas channel. The sense amplifier includes a storage element that changes state when the bus signal is asserted. As a manual adjustment is selected, the manual controller and lower edge basis corrector are connected to the image processor. The use of randomly oriented fiber chips allows post-cure machining of the mold body. The device is turned off after maintaining the upper speed limit for a calibrated duration. 0.15% aluminum by weight, using at least one laser beam, in which at least one weld joint of the full-penetration type is made using a gas mixture consisting of 30% to 80% nitrogen by volume, the rest being helium in order to assist the said laser beam.

1459828072-757c6b7d-f760-46d6-b79a-e3d0e325b1d8

A distributed collaborative computer system that supports application sharing is provided that comprises a plurality of server computers interconnected via a high-speed link. The protein X may be derived from a *Klebsiella* or *Citrobacter* gene cluster. After that, the station determines the selected access point, on the basis of the results of the monitoring.

1459828073-12e5198b-f204-4e8c-818c-366b367a0171

A continuous production system for fabricating composite articles from a moldable material includes, in an exemplary embodiment, a pair of opposed closed loop created belt conveyors spaced apart a predetermined distance. In the case of manual feeding of a sheet as the printing medium, the sheet is transported by an LF roller for an amount sufficient for feeding the tip end of the sheet to a discharge paper sensor located on the downstream side of a paper path with respect to a printing head. Preferably, a bracket that supports the cleaning cartridge is pivotally connected to a backup shoe that is fixed with respect to the web path and exerts a uniform pressure on the rear surface of the web, opposite that contacted by the cleaning cartridge. The cover seal is formed of a material that is at least substantially transparent to pumping radiation at a predetermined pumping wavelength.

1459828073-8f3246bb-e056-47ef-bc8d-e6840fac2b66

Systems and methods for therapeutically treating damaged tissues, bone fractures, osteopenia, or osteoporosis. The procedure includes setting a threshold value of signal strength. Control or data cards can be added to the gateway node as needed based on system load. The RICCB is fetched based on the address included in the MRIC instruction. Additionally, the compounds and methods do not suppress the body's immune system either locally or systemically, thus allowing for a faster

restoration of normal skin flora.

1459828073-dd92fd8c-58ae-4f63-92f5-3f77bf1a5908

A circuit breaker comprises a latching plate rotatably coupled to a moveable plate, and tensile type latching springs, each latching spring having two ends fixed to the latching plate and the moveable plate, respectively. In one embodiment a method of forming a thin film multi-junction solar cell over a substrate is provided. The invention takes advantage of the fact that the scheduling assist can be dedicated exclusively to scanning tables in its own dedicated memories looking for events that have expired and/or output channels that are available and not involve the processor in the search for output channels that are available and ready to be serviced. An electric motor drives the pump. A pre-installation component, a component assembly and a method is also claimed.

1459828074-1dae3195-c3c7-461f-9ad8-5423f3939eba

A method for detecting an operation malfunction of a leakage inspector causes the leakage inspector to execute a calibration process and an inspection process. This invention discloses vertical thermal isolators and methods of fabricating the vertical thermal isolators. The device also employs a light detector to sense at least the reflections of light from the tracer beam pulses incident on the remote surface. The apparatus includes a first release actuator for moving the second gripping member of the first gripper mechanism in a direction relative to the first gripping member of the first gripper mechanism. This makes it possible to efficiently execute the program in synchronization with reproduction of AV data or the like. The two housings can be slid together when the keyboard is unfolded and they interlock to form a sturdy keyboard having the standard QWERTY keyswitch layout.

1459828074-213067b1-f48a-4310-94d2-48130b41caba

A data writing method for a non-volatile memory is provided, wherein the non-volatile memory includes a data area and a spare area. A corn fiber lipid fraction/organic solvent solution having phytosterol esters and phytosterols is provided. In another embodiment, the drive shaft includes an outer coil that is configured such that when the drive shaft is driven in the direction tending to decrease the diameter of the outer coil, the outer surface of the outer coil pressurizes liquid distally of the outer surface.

1459828074-5693b984-4969-4136-a978-119a96eb2786

Embodiments include methods, apparatus, and systems for converting resets in a shared IO system. The system comprises one or more security syndicate offerings offered for sale by an issuer, and a security syndicate transaction system. The seat deck assembly moves relative to the main body along a varying radius path. Furthermore, in a real operational network, which may traverse different operational domains administered by different entities, full on-path support is a difficult challenge. An emission spot of the first laser part and an emission spot of the second laser part are located away in approximately the same horizontal direction perpendicular to the direction of the stack of the first and second laser parts.

1459828074-78d901b2-44ae-4a0e-955a-1f8457e0b163

Steady-state cooling of the skin is achieved by a support surface without requiring external power or circulation of air. The driver may intercept an outbound packet, the driver terminating a first transport layer connection with an application of the endpoint. According to the frame-varying addressing method of the invention, the addressing sequence of scan lines for display of any frame or subframe is arranged in the same direction as those for display of its adjacent frames or subframes, and is selected to be different from those for display of its adjacent frames or subframes. The controller provides signals to the displacement member to eject drops. The stabilized compositions may be useful in cooling apparatus, such

as refrigeration, air-conditioning, chillers and heat pumps, as well as in applications as foam blowing agents, solvents, aerosol propellants, fire extinguishants, and sterilants. The system and method according to the present disclosure provide for a digitally controlled system, such as an electrosurgical system, to confirm or verify its operating frequency using a single external device, and software and/or firmware.

1459828074-c0bcf52b-cf39-410e-919d-28e1fb94164a

In one embodiment, the input circuit includes a receiver circuit that generates a data signal based on a pair of differential data signals. Lightweight, thin, and strong neodymium magnets used in this card holder provide a desirable combination of weight, size, and performance. In some embodiments, the thiol ester compositions include thiol esters, hydroxy thiol esters, and cross-linked thiol esters.

1459828075-1dd90668-02ea-458c-b3cb-2b403a1bb9bf

A multiple-frequency RF trap and an MRI system including a multiple-frequency RF trap. The primary channel defines a primary channel orifice in the flow-regulating member and the plurality of secondary channels define a plurality of secondary channel orifices in the flow-regulating member. At least a portion of specified parameters may be transferred to a first communication device coupled to the communication network. The cells can be hexagonal, round or otherwise shaped.

1459828075-6bd183ef-44da-42b3-b212-890d41409f67

A photomask for patterning an integrated circuit device using a patterning radiation may include a transparent substrate, a pattern of radiation blocking regions, an array of radiation blocking regions, and an array of shadowing elements. A traffic lamp including a memory operates according to one or more operating parameters on the memory. The display also includes a plurality of pixel control circuits that are each configured to regulate emission of light from a pixel. The SCP transmits an SCP response including the absolute address for the call processing system.

1459828076-75310834-1fb7-47f4-9d19-745dca775106

An optical apparatus includes a control unit configured to perform control to change power consumed by a lens unit or operation state of an actuator of the lens unit during processing of an image signal obtained from an image pickup element according to a noise tolerance of a camera and a set state of the camera, such as an ISO speed rating. A method for producing a developing solution for photolithography capable of suppressing TBAH deposition when producing the developing solution by diluting a concentrated developing solution containing TBAH and a production apparatus used for the production method. The substrate includes organic light emitting diode elements. Based on the PWM mode signal, the regulator is switched into a power saving low power operational mode. Tetraalkyl ammonium fluoride, ammonium fluoride or the like is used as hydroacid fluoride salt. By the abovementioned process materials with a defined thickness in the region of  $\pm 10\%$ , preferably  $\pm 15\%$ , of the average thickness are available.

1459828076-7d461fea-600b-4473-8ebf-a298253be9f3

A mesh network for routing a plurality of data segments therethrough, each of the data segments containing address information. The arrangement includes first and second laser sources each having a first laser for generating an optical beam of a relatively low frequency F1 and a second laser for generating an optical beam of relatively higher frequency F2. A bottom wall and an opening are arranged respectively at opposite ends of the handgrip.

1459828076-a869e9cf-ec7d-4658-8e13-8177673bf6f8

Hydraulic actuator as an element of a system for controlling an engine valve is presented. This allows side projection of images in a manner that avoids the potential viewer obstruction of the projection path. By packaging the payload with

uplink control information related to each MIMO mode, the uplink control information can be utilized with any suitable or available MIMO mode. The housing is configured for docking with the printing system.

1459828077-a961eec5-9667-4b0a-9322-2c7ef2b09983

Apparatus and method extract data from a data stream. By reducing the transport height of the mobile home frame, valuable mobile home design height is recaptured to permit construction of a mobile home with a greater wall height and/or roof pitch. The current transformers are arranged for physical correspondence to the power outputs of the power distribution cabinet. An output of the circuit is respectively connected to upper and lower potentials through the outer switches and is further connected to a center potential applied between the upper and lower potentials through each of the upper and lower bridge segments. , or to a temperature within the range of from 400 C. The capacitor elements 10a, 10b are combined through a connecting ring 22 having female screw threads 221 with the pedestal 15a, 15b facing back-to-back.

1459828077-b120b1e8-b311-4db6-bb2b-91c9314c413b

A catheter tip for mapping and/or ablation is provided. The optical window structure includes a polishing pad and an optical window opening in the polishing pad. A seat is located for the dominant partner, the seat being located between the arcuate legs near the hip portion of the flat padded support. Each of the base transceiver stations transmits a page and buffers the application data. Furthermore at the natural drag frequency of the corresponding blade, the elastic bias substantially blocks the secondary piston in its channel, and the flow of fluid between the chambers of the damper takes place mainly via the restriction port calibrated to provide substantial damping at this frequency.

1459828077-fa1f869b-32e4-4f5c-bc30-d08b29867338

A sexual aid device comprising a battery powered electric vibrator which attaches to the user's tongue. The fuel cells use a methanol/water mixture as the organic feed. The first condition for capturing hardware scan dump data is the service processor being activated into an active storing mode of operation labeled \u201cAlways\u201d. The modified data block of j bits and at least some of the masked intermediate data blocks of j bits are combined to form a result block of k bits corresponding to the initial data block of k bits by means of a transformation including the specified non linear operation. A valve controls flow through the outlet conduit as a function of a sensed temperature in the intake circuit.

1459828077-fc2884c7-a8ab-465b-bbd1-7afe49b4d29e

A prosthetic heart valve is provided with a cuff having features which promote sealing with the native tissues even where the native tissues are irregular. The lubricating coating is a coating which comprises a lower lubricant layer which is in liquid form in the temperature range of above 0°C. Weight sensing pad 10 is used in conjunction with the vehicle's airbag control module in order to allow deployment of the airbag, in the event of a collision, only if the seat is occupied by a person of a preselected weight. Diffusion of the vacancies to the active layer is thus suppressed. Translation of resource requests may occur within the operating system or outside it.

1459828078-17b0d314-c31a-4664-a604-9151e8488b7b

A method, system, and apparatus are disclosed for multipath isolation through the combined use of antenna diversity and frequency diversity. When an interlayer short-circuiting occurs between the drain wire and the shield common electrode, it induces a critical defect on a screen display, however, a line defect can be repaired/extinguished by cutting both the sides of the slit at the short-circuited portion with laser repair and separating the short-circuited portion. In operation, only one switch at a time of plural first switches is \u201con\u201d to connect the voltage signal from a corresponding pixel to the column bus while all remaining

plural first switches are \u201coff\u201d to isolate the column bus from all remaining pixels. Alternatively, the data corresponding to the write operation may initiate the lock operation.

1459828078-cafb870-b6b6-43d6-ad3a-b9bb64abac36

A keyboard instrument includes: an instrument body; at least one speaker; and at least one acoustic pipe configured to collect a sound emitted from the at least one speaker and guide the sound to at least one sound emitting opening formed in a front face of the instrument body. The ophthalmic composition comprises a combination of Component 0. In one embodiment, vascularized tissue grows into the plug and prevents or discourages formation of scar tissue around the plug. After the preliminary first electrode is formed, both sidewalls of the preliminary first electrode are partially etched isotropically to form a first electrode having a uniform width and height. A throttle device throttles the inflation gas flow into the inflation tube and is arranged in the flow direction of the inflation gas behind the sealing device in the gas release nozzle. Each generator in the set is associated with a controller, a set of loads designed to draw power from the power grid, and a grid controller designed to provide a load partitioned configuration for the set of controllable generators, based at least partly on the power draw of the set of loads.

1459828078-ed67e286-7757-412f-a8cf-44a6b397c7b2

An LED apparatus of the type including a mounting board having an LED-supporting surface with an LED device thereon and a lens member over the LED device establishing a light path therebetween. The wax pattern has a profile conforming to that of the golf club head. The crude product stream is formed by contacting acetic acid and formaldehyde in the presence of at least one aldol condensation catalyst under conditions effective to form the stream. Prior to supplying the data to a client, the Extended Style Sheet is applied to the data to format the data into the format required by the client. One of skill in the art will see that this invention also applies to other kinds of text documents.

1459828079-0305f143-477d-44bf-9dc2-1cb60c9edd07

A music tuner having both a contact sensing device and a non-contact sensing device to pick up the sound from a music instrument is so designed that it can automatically or manually select one of the sensing devices that is most suitable to the situation where the music tuner is used. The telematics unit is programmed or configured from the manufacturer with the same parameters as a cancelled or deactivated unit, with a cleared number for re-acquisition. The negative capacitance circuit reduces the effect of the sensor stray capacitance to provide an increased bandwidth and decreased noise on the amplifier output. A second terminal zone of the first conduction type is formed in the first layer.

1459828079-078c3c1b-214f-4fe6-998b-cef5f8f05e6d

Multi-layer thermally imageable elements, useful as a lithographic printing plate precursors, are disclosed. The substrate of the first integrated circuit comprises first pores separated by first partitions, and the substrate of the second integrated circuit comprises second pores separated by second partitions. In remote mode, an IRRF remote control is used to change settings for any device connected to the controller.

1459828079-2861792a-5a06-4dc2-b9c7-92375d377942

A method for joining and holding closed a wound in bodily tissue, fastening junctions of wounds, tying off wounds, joining a foreign element to tissue, and altering the position of tissue using a barbed suture including sharp pointed ends. A PCB forms an aperture corresponding to the pedestal, includes electrical conductors on an upper surface thereof, and is attached to the lower planar surface. On both sides of the coupling member, there are two hollow ducts which are linked through a first shaft duct in the center and surrounded by a plurality of

laterally penetrated ventilation openings. Each one of the first layers and each one of the second layers are alternately deposited on each other.

1459828079-49b6132c-0c45-4105-a834-87b84d2f8d11

The present invention provides a control device for a vehicular drive apparatus with a structure of enabling the suppression of gearshift shock occurring during concurrent shifting executed of a first shifting portion and a second shifting portion. A thin film transistor is disposed on a substrate and has a drain.

Information received from the light detection apparatus is compared with information previously received from the light detection apparatus and stored in a memory so as to identify when the light detected by the light detection apparatus is the same or substantially the same as light previously detected by the light detection apparatus.  $f_1$  represents a focal length of the imaging lens;  $f_2$  represents a focal length of the second lens; and  $f_3$  represents a focal length of the third lens. Other impurities can be captured. The method includes wirelessly receiving data via each of a plurality of antennas, the data corresponding to a packet of information transmitted from a remote station, sampling the received data corresponding to the received packet to form data samples for each of the antennas, and determining a measure of signal quality from samples of the received data for each of the antennas.

1459828079-f41b3df9-42bf-434d-a994-904958c9299d

This invention relates to a new and distinct variety of strawberry named 'Cabot' characterized by its few, small flowers, large calyx, large and light colored fruit, and resistance to red stele root. The word 'compel' is an acronym of the words 'compressed air and electricity'. The first body portion includes a latch fixture rotatable with the latch body between the latched position and the unlatched position for selectively securing a module unit in the base unit and ejecting the module unit from the base unit. The flap has a plurality of mounting openings.

1459828080-332f9fe9-9295-47e8-b319-850c33a699c6

A magnetron has a cathode, an anode with vanes, and an insulating surface which faces the cathode and receives material from the cathode due to sputtering at the cathode. The casing 1 is divided into an instrument panel-side part Rp and a fire panel-side part Fp with the recess 12 as a boundary S. Methods for using and fabricating flexible tubes are also provided for various shapes of support members including annular ribs, helical ribs, spaced apart coils, narrow ribs, wide supports, as well as for various cross sectional shapes of flexible tubes, including streamlined elongated hydrofoil shaped cross sectional shapes relative to the longitudinal axis of flex tube.

1459828080-421e19ad-7550-410b-95b9-5f8bb22cf8c0

A process for metal coating diamond superabrasive particles involves heating the superabrasive particles in the presence of coat-forming powder of a metal compound under a common inert atmosphere. The test circuit is positioned between a conventional tester and the circuit to be tested. The second insulation layer is disposed on a second main surface of the first insulation layer situated on the opposite side from the first main surface.

1459828080-5adb3eae-3f39-4b7e-a782-61276b475422

In an RLS antenna, the present invention allows adjusting the optimum positional relationship between the feeder section of the feeder disk and the feeder section of the antenna disk, simply, quickly and at high accuracy by a visual check, so that mass production becomes possible, and an increase in performance and a decrease in cost are implemented. The robot includes a trunk, a pair of leg links coupled with the trunk in a swingable manner, an actuator group that swings each of the leg links independently to the trunk, and a controller that controls the actuator group. The VOC containing effluent is passed over the first reactor for

adsorbing VOC, while the second reactor, which is loaded with VOC from the previous cycle is regenerated with part of the treated gas made up with an appropriate amount of air. Thus, each memory cell may effectively store three states: zero, one, and don't care.

1459828080-8b362fc0-2364-4bf7-aa38-9e889922c9bf

An intrusion detection system, and a related method and computer program product, for implementing intrusion detection in a remote, on-demand computing service environment in which one or more data processing hosts are made available to a remote on-demand user that does not have physical custody and control over the host. A wireless transmitter wirelessly transmits digital signals containing the video events captured by the video camera and the audio events detected by the microphone. The linear filtering is performed in the signal processing and image processing related fields using the wavelet transform with a method that is mathematically equivalent to the filtering operation in the spatial domain. The data groups have at least two data channels respectively.

1459828080-a5b692a3-0a50-40ec-82b3-1dd57f49cb47

A method and apparatus are provided to remove dataless TDM frames when transporting private line traffic over an ATM network. A plurality of hinge portions are coupled to the frame assembly. A first sputtering source is configured to deposit a plurality of absorber layer atoms of a first type over at least a portion of a surface of each one of the plurality of substrates.

1459828080-da17684a-71dc-47a9-939c-100d1d08814e

A method of preparing an apparatus for material processing by generating optical breakthroughs in an object. Input characterizing events related to patterns components may be received in a visual modeling tool, a type of event may be associated with a service to resolve events related to different patterns having a same type of event, and the service may be initiated to resolve the type of event. A resistance element is disposed at each of the air flow openings in order to impede or prevent the escape of air from the restraint volume compared to the inflow at the respective air flow opening. To be rendered, one or more volumetric objects are tessellated into a series of one or more volumetric primitives. Responsive to the completion of such a purchase transaction, access to the purchased unlockable in-game content is facilitated for the one or more beneficiaries. The low-resolution graphics engine builds a low resolution representation of the display article which is displayed on and used to facilitate the customization of the display article at the user interface.

1459828081-755f22a0-bb5d-41f2-a2b0-85b1e263e7f3

A tomato-based sauce and a process for making such sauce. 11 Wi-Fi network and an Ethernet local area network. The slave controller monitors the pulse feedback from both the master encoder and the slave's encoder and compensates for any position error by adjusting its motor output speed. The stored packet buffers and stored MAC header are transmitted across a network thereby reducing DMA requests.

1459828081-82a7c232-0d50-4413-b1d5-44bfff007087

Methods and apparatus related to the detection of low-rate visible light communication signals and the recovery of information communicated by the VLC signals are described. A container and/or a closure produced according to the method are also disclosed, as well as an intermediate product for producing a container and a closure. It is determined that the wireless device has entered one of the plurality of locations, and a timer is started using the at least one timer duration associated with the entered location. A template is applied to the femoral broach and seats itself against the buttress of the broach locking it into place. A mask signal generating circuit generates a mask signal MSK which is at a high level during an interval multiplied by a coefficient to a pulse width  $T_p$  of the frequency generation signal SigFG after level transition of the frequency generation signal

SigFG.

1459828082-10ed0281-601b-432f-a8b3-29805f7279bc

A method and apparatus for an electronic substrate having a plurality of semiconductor devices is described. Also disclosed is a method of injecting an encapsulant into an assembly and a method of treating a microelectronic component to form a void free layer. The truss maintains its geometry in an improved manner after the onset of yielding, thereby increasing ultimate strength of the pole-truss assembly. The printer can be, for example, an ink-jet, dot matrix, dye sublimation or thermal printer used to print tickets, vouchers, coupons or the like. The image transferring unit is removable from the casing of the apparatus independently of image forming devices arranged around the photoconductive element other than the image transferring member.

1459828082-16f0ba57-fbf0-46f5-87a7-f868114571ce

A power supply apparatus for vehicles is provided. The inverter is electrically connected to the motor to supply a drive current to the motor. The silicon device also includes a frame made of silicon surrounding and spaced from the beam-like structure and on the insulating substrate. This allows for better absorption of certain materials being fused by the laser. More particularly, a grip-enhancing glove, and method for maintaining a grip, which enables a user to maintain a prolonged grip without incurring undesirable effects.

1459828082-6f07d08c-0511-4798-8f1c-fa7fe1898fda

For cavity enhanced optical spectroscopy, the cavity modes are used as a frequency reference. In embodiments, the low adhesion coating is an oleophobic coating that exhibits a contact angle of greater than about 35° with ultra-violet gel ink or solid ink. This enzyme mixture is prepared from a genetically modified strain of *Trichoderma reesei*, a floating gate electrode and control gate electrode of the nonvolatile memory device.

1459828082-8b291510-c6c6-4829-9730-ce34fcec6717

A method is provided for forming a graft in heart tissue which comprises the transplantation of cells chosen from cardiomyocytes, fibroblasts, smooth muscle cells, endothelial cells and skeletal myoblasts. The method acts to control the movement of different cells to reduce the density of the cells prior to legalization of the cell placement. An impulse is detected in the first timing signal and a first timing parameter is set based upon the detected impulse in the first timing signal. A comparator stage has feedback units able to act on the second input in a follower relationship with respect to the signal present at the first input avoiding saturation of the differential stage. Several such provisioning systems may run concurrently, thus enabling high flexibility as to instant and local/regional system restructuring, e. On arrival of the call, the call is routed to the selected agent.

1459828082-e060ef1c-60d9-4a24-b80b-f5cb4bf15333

Foodstuffs filled in glass containers undergo a change in taste under the influence of light. Using uniform distribution as initial condition, the EEM may converge iteratively to a global optimality. An optional rubber coating may be applied to the interior/exterior of the body for insulation purposes. During the elimination game, the entities play one or more games that are provided as part of the elimination game.

1459828083-937a6821-157e-4cd9-a426-acbc03829c8b

Systems and methods for adjusting or providing instructions to spraying systems are provided. According to the invention, the basic mode of the acoustic bulk wave that can be generated in the resonator is suppressed while a higher mode can be excited in parallel and be utilized for the resonator by adjusting the acoustic mirror. The disclosure concerns methods of regulating seed oil content, fatty acid synthesis

and fatty acid composition using the DGAT2 gene and to tissues and plants transformed with the gene. A fan assembly blows heated air and ions toward the conductive grid, whereat ions of one polarity are substantially removed.

1459828083-daa60feb-644f-4d7c-a9ca-37d748ac02a9

A portable navigation apparatus is provided. A laser is associated with one of the two structures and a target is associated with the other of the two structures. When the mouse has been admitted to the pouch via the passage, the sleeve may be separated from the pouch and the open mouth of the latter rolled to form a seal, thereby retaining the mouse within the pouch. The system may be employed as a portal screening system, and may include a structure having a wall and a roof, for rapidly screening persons for concealed objects.

1459828084-07df8a36-2940-46cc-b3ab-d0eee452297b

A method for production of a nuclear fuel element with oxide base, in which the nuclear fuel with oxide base is mixed with Cr and sintered to a solid body. The bait station has the general shape of a box with a locking hinged lid. The models in a stepwise manner generate an IS architecture meeting desired performance criteria of the business entity. Each digital signal sample is time stretched by storing each sample in M memory locations, such that N samples occupy MN memory locations. Examples of resulting nanowire heterostructures include a longitudinal heterostructure nanowire and a coaxial heterostructure nanowire.

1459828084-6126a7a9-52eb-48b9-8026-e769ae3ee549

An integrated design-for-manufacturing platform is provided. The programming voltage at the time the page is programmed verified will be to estimate the initial value of a starting programming voltage for the page. The attachment means permits the user to adjust the angle at which the baton is held and permits the angle to be fixed so that the user need not readjust the position each time that the scabbard is worn. In an effort to minimize the latency associated with detecting IOP related events, the polling may be initiated frequently by an operating system task dispatcher.

1459828084-786c07e0-2afd-4050-8b56-30dcc67f943a

A multi-level power amplifier architecture using a multi-tap transformer implemented on a single CMOS integrated circuit wireless communications device is described. The data is simultaneously read from or written to N tracks by N spots, N being an integer larger than or equal to 2. The second type reflector is capable of concealing the first type reflector. A deviation of the duty cycle of the clock signal is detected in the duty cycle detector 20 and used to correct the duty cycle in the correction amplifier 16. The BIOS ROM includes a ROM temporary storage and a DMI data storage.

1459828084-93ba6faa-5d23-45dd-bef6-4b2ec0b9a8f4

Air-conditioning system for aircraft, in particular for commercial aircraft, with a bleed air source, a bleed air line comprising a main valve, and an air-conditioning unit, wherein a mass air flow conveyed from the bleed air source through the bleed air line to the air-conditioning unit can be controlled by means of the main valve. The present solenoid assembly includes a solenoid snout having a longitudinal bore terminating in a fluid orifice wherein a one-way check valve has been installed to prevent transmission fluid backflow from the torque converter when not operating. The circuit is operative in a first mode to decouple an information line from the IHS in response to a disable command and operative in a second mode to decouple the information line from the IHS when a voltage in the information line exceeds a predetermined threshold voltage. The upper surface of each of the extension sections has a plurality of wells therein. A cost function is used to determine whether each pixel belongs to one of the planes, and the image elements are labeled accordingly. Various applications for the device are disclosed, as well as method for securing an all-terrain vehicle with the device.

1459828084-d4afb5c5-6459-4ad7-a80e-36ef27701c2c

A method for application in conjunction with an exhaust gas post-treatment system for metering an ammonia-releasing reducing agent into the exhaust gas stream of an internal combustion engine installed in a motor vehicle and operated with excess air. Intermeshing electrodes are then applied either over the heater patterndielectric layers or on the opposite side of the substrate. The cam element is rotatably mounted in a flexible encircling element which is displaceably connected to the cam follower element on a plane that is perpendicular to the rotational axis of the cam element.

1459828085-68c2a749-9f77-4ff8-a2a7-d2737b019c5c

Method and network entities for providing good performance for voice in multiRAB connection for services of a CS+PS call setup without high throughput necessity but providing good throughput for the services needing it. A flashing unit provides an affect to an outlet where the strand of lights on the tree or another lighted device will turn on and off until the water is filled into the base again. The interchangeable lens unit incorporates a data storage section. By integrating the actuators and the sensors together certain performance limitations become negligible and can be discarded.

1459828085-6a08133a-677c-4423-b32d-93eab881ab1c

An implantable apparatus for controlling fluid flow within a host body includes a constricting member for allowing fluid flow within a body canal when in an open position, and for reducing fluid flow within a body canal when in an closed position. A restraint device is coupled to a controller that controls the operation of the restraint device in response to the first sensor and the second sensor. A closer cable of the door-lock mechanism is coupled to a carrier of the planetary gear mechanism, and coupled to a latch of the door-lock mechanism via a coupling link. An accumulator may be provided for storing and selectively discharging the captured energy to a generator to produce electricity. The invention proposes to make provision for energizing means generating an RF energizing field within the examination zone for inductively supplying electric power to the wireless receiving units, wherein the frequency of the RF energizing field is an integer multiple of the sampling frequency. A diameter of the passage fits a first injector with a first mating structure, and an outer diameter of the joint portion fits a second injector with a second mating structure.

1459828086-3924b2ff-b8d3-465c-910f-6da71fcb7c97

The present invention relates to the use of ulvans, in particular extracted from green algae of the genus *Ulva* or *Enteromorpha*, or of ulvan-derived oligosaccharides, as elicitors of mechanisms for nitrogen absorption and protein synthesis. The invention relates to the seeds of soybean cultivar S110268, to the plants of soybean cultivar S110268, to the plant parts of soybean cultivar S110268, and to methods for producing progeny of soybean cultivar S110268. The emitter provides the process interface and is formed from a material having properties which include microwave transparency, chemical resistance and/or mechanical strength. A latency analysis process is performed using the acquired metrology data.

1459828086-538aa1fb-d3e8-4f31-883d-b4b12846ec5b

A gas turbine engine includes a combustor system including a lean premix combustor and a water delivery system. The frame further includes a plurality of vertical stud members having a first end and a second end, a top beam attached to the first end of the plurality of vertical stud members, and a bottom beam attached to the second end of the plurality of vertical stud members to define a plurality of cavities between adjoining vertical stud members. A plurality of sensors can be provided for sensing usage of a plurality of parts of the aircraft, and the estimate of usage of the part can be stored for access of the estimate by ground

personnel. 17 and having a weight average particle diameter of 1 to 12 m, and the first light diffusion layer having a thickness of 50 to 200 m. A variety of dynamic challenge questions can be used without the need for the cardholder to enroll into the program.

1459828086-684901de-3066-4896-982b-3ef364422e0e

Electronically tunable and reconfigurable hyperspectral IR detectors and methods for making the same are presented. The method comprises the steps of unrolling a desired length of the film from a roll. The base-end portion is pivotally held on the base plate. The frequency domain data is multiplied by crosstalk coefficients to obtain a frequency domain correction signal for each channel. The system may also include a controller coupled to the transmitterreceiver, operable to receive and/or determine information regarding the temperature, location, and/or content of the food storage bins via signals received from the transmitterreceiver. The wagering game may include a basic game and a bonus game.

1459828087-0bfee86f-3ef0-465f-ab44-b5510ff99b1f

A sheath device comprises a substantially rigid elongated body adapted to receive a chest tube. A hardware-software complex is used to find a bug or intrusion device in a vehicle electronic system. The method further comprises, in the wireless communication device, processing the instructions for the data session and transferring a session request for delivery to the routing system to establish the data session with a device management system identified in the instructions, and in the device management system, performing a device management task on the wireless communication device.

1459828087-2eda6c9c-da9f-4116-bbe3-613dc644c4a5

In a method of generating an anomaly detection model for classifying activities of a computer system, using a training set of data corresponding to activity on the computer system, the training set comprising a plurality of instances of data having features, and wherein each feature in said plurality of features has a plurality of values. The computer program product and method includes the steps of identifying a solution for preparation and its associated volume. The screw is removably mounted to a cradle and the screw and cradle combination is positioned within the canister so that it is generally parallel to the base of the canister.

1459828087-4416ea20-da87-4dac-a86f-353374f90839

A force sensor of the present invention corrects the output voltages of Hall elements without using a temperature sensor in response to changes in the characteristics of a magnet and the Hall elements. Recorded data that includes transactions executed in a session established between a client and a server at a designated point in time is extracted. When a user from a network that natively uses SSD authentication roams into a triplet-based network, the authentication interoperability function produces triplets from the current SSD. Sucrose docks into the active site of Novamyl differently from the substrate or inhibitor in published models 1QHO and 1QHP.

1459828087-9dd05608-4938-4c48-9f13-2cf47b0ede1d

A wireless protocol for a communication system is set forth herein which may be utilized for communication between a transmitter and a receiver over any type of communication channel. A gap between the first group of lens and the second group of lens is reduced and a gap between the second group of lens and the third group of lens is widened when wide mode changed to Tele mode. The cooling elements have a substrate with an underside and an upper side.

1459828087-b705fc57-9b5d-4d1f-8d89-e21600d1fa14

A dispensing system allows cryogenic liquid to be dispensed from either a primary bank manifold and associated cylinders or a secondary bank manifold and associated cylinders. Opposing it is a clamp body with an opposing clamp face. The generator

accepts extended BNF language specifications containing embedded reverse polish plug-in call specifications giving the plug-in number to be called as well as an arbitrary textual parameter to be passed to the plug-in.

1459828087-f1ea9e80-92bf-4e18-817c-383fa30925a8

A device for working human and/or animal tissue is provided. Based on a detection signal from the sheet sensor, the strengthener is moved to advance into and retreat from the sheet ejection route so that only a necessary part of a sheet can be strengthened. Still objects of the invention are the use of such light emitting materials and organic light emitting device comprising such light emitting material.

1459828088-813a14ec-dc5f-4189-9cc0-1d42ac74b544

The present invention is a process for making a low color copolymer of ethylene glycol, isosorbide and terephthalic acid or dimethyl terephthalate. The compositions include a binder, a transparent or semi-transparent colorant having an average particle diameter of greater than 150 nanometers; and at least one member comprising a scattering pigment dispersed in a matrix. The foil may be provided with a radiation-absorbing surface that may be configured both as a flexible foil and as an inflexible foil that may be of either metal or of a polymer, paper, cardboard or other materials that are based on wood. The housing has a door portion that is separable from the housing. If the result is yes, an image-identifying module begins to identify the target-image and the unwanted object in the first image, and then, an unwanted object processing module starts the step to process unwanted images.

1459828088-9bb72db8-fc0f-435e-855c-528e5fa5158b

A dynamic or non-volatile memory with a differential reading system with improved load rebalancing comprising a rebalancing circuit that for values of the supply and memory selection voltage in excess of a predetermined reference voltage modifies one or the other of two currents, *i*. The UE receives the Radio Bearer Setup message and assigns a first START value to a START\_VALUE\_TO\_TRANSMIT variable according to the HFNs of all established RBs in the first domain. In response, the server component can send a script to the window for retrieving the window's actual identifier name. Systematic data may be transmitted on both channels, with or without interleaving on an alternate channel. The component comprises a conductive ground core arranged to extend through multiple-layers of the substrate when the component is inserted, a dielectric layer laterally encasing the conductive ground core, and a signal conductor layer coupled lateral to the dielectric layer.

1459828088-afccf030-dbdb-4e5a-ab4b-84b32c2df7fd

A power field effect transistor is disclosed which is fabricated in as few as six photolithographic steps and which is capable of switching current with a high voltage drain potential. A dual-contact assembly includes a positive contact, a negative contact, and an insulating connector disposed between and connecting each of the positive contact and the negative contact in an electrically insulating disposition relative to each other. Multipliers each multiply step function values output from relative step function generators by discrete data values held cyclically in data holding sections. A photoreceiver cell with color separation may find broad application in multielement photoreceivers for video cameras and digital cameras. for a softening temperature of 60 to 115 C. In organic polyisocyanates having at least two isocyanate groups, the isocyanate groups are blocked with OH acidic cyclic ketones of the general formula.

1459828088-c1a40b9c-3e57-48db-bcde-db38338bf2f4

A system, apparatus and method for controlling environmental zones in a residence or other building using radio frequency enabled environmental controllers. The mathematical model may include a control-signal-related component, a control-signal-independent component, and an error component. Where it is desired to trim

sideburns, the trim guides are attached to the temple pieces. The plural bank state machines are connected to the command dispatch device to receive the control signals dispatched by the command dispatch device and accordingly determine whether to transfer its internal state or not.

1459828088-dd4dbb5a-3071-476d-a416-d1453eea2109

A driving method for a flat panel display. The apparatus includes a storage area network and a plurality of Fibre Channel Switches arranged in a Fabric. These changes include a gain of chromosome 10, a gain of chromosome 11, and a loss of chromosome 7.

1459828088-f5c0049a-eb73-4eb3-bd28-993840e956a5

A solder bump structure and laser repair process for memory device include forming a first dielectric layer on a bump pad of a semiconductor wafer. A control FET and a sync FET are connected in series between input dc voltage terminals. The encoder has an outwardly oriented circumferential surface in the shape of a truncated circular cone. The cockpit opening is formed in the bow deck portion. The master includes a mechanism for continuing a sequence of reads allowing prefetching until a request is made indicating a prefetch amount of zero.

1459828089-7cc6752e-63a8-4f9f-8435-588c83280bd8

Methods and reports for presenting genetic information that is patient-specific and relevant to treatment of neuropsychiatric disorders, including treatment resistant psychiatric disorders, to aid in patient treatment in a phenotype, genotype or biomarker-specific manner. The mask generated from the most significant bits section of the pointer mask) includes bits corresponding to various regions of the output mask. The fluid delivery manifold extends between a proximal end fluidly coupled to the fluid supply and a distal end having at least one aperture for delivering the therapeutic solution to the defect adjacent the articulating surface of the first tissue site.

1459828089-c43b6957-bb31-4629-b171-1241b419a574

A taping tape includes: a base material 12 having elasticity; an adhesive layer attached to one side of the base material 12; and plural slits 14 that are formed along one direction on an inner side of the base material 12 and are arranged parallel to each other. The load detector includes a magnetostrictive sensor which includes a hollow case, a coil housed in the case, and a rod-like magnetic member located at an axial center of the coil, magnetized by an electric current flowing through the coil and receiving a load at an end thereof. At least one trigger can rotate about a trigger axis. During readout of a multi-storage pixel, charge may be transferred from each of multiple storage nodes one at a time to a floating diffusion node. The inlet and outlet assemblies seal two ends of the upper heat-storage cavity and communicate with two ends of the lower heat-absorbing cavity. The chamber located in the feed tube forces the ball into the barrel and creates a vacuum to eliminate the ball blowing back up the feed tube.

1459828089-fe5e39b3-1a07-445c-9822-b4de7612e589

A method is disclosed for estimating tissue velocity vectors and oriented strain from ultrasonic diagnostic imaging data. In the method, a designed layout of target patterns is provided, and transferring the designed layout on a wafer to form wafer patterns. The present invention obtains data bytes for multiple columns at one time. The supply current is a mixed current formed by superimposing and/or modulation of an alternating current portion onto a direct current portion.

1459828090-32a401d4-3503-4762-b9fa-db69a33e3f9e

The present invention provides an information processing apparatus capable of dynamically changing a security level according to significance of overall data saved in a terminal. The present invention solves the problem of lower security of user information. The storage device for the multilayer substrate further comprises

a bracket moving device, and the bracket moving device drives one or more the brackets to move up and down along the support. The wall portion is releasably securable to an end of the cassette. An alternative embodiment provides an end piece having a telescopic extension portion to adjust the length of the end piece for securing the hanger device surface of varying widths or depths.

1459828090-48ff7bf9-4212-4918-8b79-2a064c726572

A water meter has a meter register having an encoder having electromagnetic wave emitters, e. The conductive housing includes a slit extending from the first principal surface to the second principal surface. When they match and image frames do not match, a picture type is reused. The stored failure rate information and the identified current configuration dependencies can then be used to generate predicted failure rates for the computational resources in the current configuration of the system. The reservoir is supplied with water and carbon dioxide and the technical components allow for a variety of water dispensing options. The anchoring device includes an elastomeric sleeve having a substantially elongate, hollow, and tubular body and a compression governor coaxially secured about the elastomeric sleeve.

1459828090-62795b65-932d-4adc-b00b-ce2cb264753e

A contoured package on package joint and a method for making the same are disclosed herein. The NMR spectrometer is tuned to measure a selected type of atom. The second integrated circuit is adapted for determining that an authorized or unauthorized access has occurred on the basis of the detection of the variation of the capacitance seen by at least one of the selected conducting tracks.

1459828090-cdc497fa-9478-43d5-9e16-6929da684a26

A Quality of Service Link Protocol for use in a wireless telecommunications network. At the start of a state change notification period, a timer is started. This undesirable voltage rise can adversely affect a system by, for example, inadvertently activating an inactive WL. Thus, it is easy to increase the carrying capacity of a gripper conveyor and, when applicable, to easily separate the products that are gripped in groups.

1459828091-0104e74e-256f-4938-9004-9a9c6a4d7055

A jewelry chest and box for storing jewelry having a plurality of compartments to store jewelry items of various configurations. Specifically, the devices, systems and methods provide the ability to accurately determine user input using multiple different sensing regimes. The user has a choice to receive an ordered list of items based on the individual user profile, the social network or the mood of the user. An opening is provided in the catheter and communicates with internal airway for use in controlling the amount of suction provided by the connection of the proximal end of the catheter to a vacuum source.

1459828091-322e9a65-3ecc-401f-a635-68055d625d0b

The present invention relates to laminated membranes formed by multi-layer processing techniques including alternating layers of thermoplastic urethane and a copolymer of ethylene and vinyl alcohol. The semiconductor device has a semiconductor substrate and the first and second electrical components in the semiconductor substrate. During a transition period between the transient condition and a steady-state engine condition the method combines signals primarily from both the mass airflow sensor and the manifold absolute pressure sensor to provide such cylinder air charge estimation.

1459828091-786c3caf-f147-4e1b-868f-077ba66bcb91

An intake manifold system for an internal combustion engine includes inlet runners attached to a mounting flange. Each component has end faces, at least one of which is mechanically bonded to an end face of another component such that the combined components of the stack define a single, monolithic structure that serves as both

an electrically-active element and a mechanical support element of the surge arrester. A first capacitor is connected between the base of the first transistor and the emitter of the second transistor.

1459828092-1f8897fb-ee68-4e64-8a68-dec49a006e8a

A flexible results pipeline for a processing element of a parallel processor is described. The fastener assembly further includes a base member that engages the retaining plate through its associated bed liner hole such that the base member and the retaining plate engage the bed liner and cargo bed in a clamping arrangement, securing the bed liner to the cargo bed. The CUTs may be used in ultrasound devices such as ultrasound imaging devices and/or high intensity focused ultrasound devices.

1459828092-2d21ef01-b891-4684-920a-df1cfbb52a1f

A method for labeling a UV-fluorescing substrate includes positioning a UV-fluorescing substrate adjacent to an inkjet material dispenser, and selectively jetting an edible, invisible, non-UV fluorescing ink onto the UV-fluorescing substrate with the inkjet material dispenser. For each of the plurality of the computing systems, a plurality of consumption parameters from at least one measurement device is received. Using the received data, one or more of the prefabricated elements is selected. The extended resilient means is retractable such that the plate exerts a constant force on the bag to expel fluid in a uniform flow rate.

1459828092-34e81f74-4fea-44ba-8a47-f81b23199c87

A cathode ray tube including an internal magnetic shield in the shape of a hollow rectangular frustum including two long sides opposite to each other and two short sides opposite to each other, having an opening at its top and bottom attached to a mask and a frame. The process absorbs CO<sub>2</sub> through the formation of MgCO<sub>3</sub> and releases water product H<sub>2</sub>O. This models the cost function in a quadratic model and computes the cost for a nearest integer pel and plural adjacent integer pels.

1459828092-83a123f8-95e4-4fd9-a6f2-aeefb68688bd

A change-over apparatus for cooling a gas passage is provided with a cooling chamber and a gas cooling and circulating system. The request may include an IP address of the first device. The value of the time parameter is set currently depending on the current speed of the mobile station through the cell network of the mobile telephone system. This invention is also directed to a switch constructed from a button, a label plate, and a backer plate.

1459828092-e49eb32e-9f75-4365-92b2-e9e5e971cd00

Disclosed is a process for preparation of final graft polyols via a continuous process. The dishwasher includes a tub, a door, a steam generator, and a dish storage. The advertisement database stores subscriber specific or third party advertisements that are selectively associated with communications in a telecommunications network.

1459828093-47f772a7-0c8c-4183-8e87-7c993c26d7af

This invention relates to the stabilization of oil microemulsions containing an active azo biocide by addition of an alkaline, water soluble buffering agent in an amount sufficient to adjust the pH to between 6 and 14 and to the use of said oil microemulsions to control infestations and/or infections when topically applied to livestock or domestic animals. The table design permits a user to apply low levels of traction to the lower back by pushing lightly on adjustable arm support posts. The container securing portion and the tray or tote portion may comprise a single component or may comprise separate, connectable, components. The air pump is turned on when the internal pressure is higher than a predetermined first pressure value. The outboard motor simplifies the upper casing for disposing a transmission therein and assembly and maintenance thereof.

1459828093-6acb5c85-02d2-4416-b8db-21ea8e40f818

A pipette tip mounting shaft includes outwardly circumferentially extending locking lobes over which the pipette tip collar is mounted. The electrical wiring device includes a device housing and at least one switch disposed within the device housing. Registration is accomplished by tacking the respective elongated continuous structures together while the respective features on the elongated continuous structures are in proper registration. The attachment member is movably coupled to the base member. An interface region is provided for interfacing the remaining LE array base signal routing architecture to the IP function block. The cooling system includes a compressor, a condenser, an evaporator and a refrigerant that is circulated in sequence from the compressor to the condenser, to the evaporator and back to the compressor during routine operation of the cooling system.

1459828093-caa7c3bd-72f9-481b-af61-42ac6cfef792

In a flat image display device in which a first substrate having phosphor layers formed on an inner surface thereof and a second substrate having electron emitting elements which excite the phosphor layers are located opposite each other with a gap therebetween, the plate thickness of the second substrate is made smaller than the plate thickness of the first substrate. A contaminated gas containing volatile organic compounds is continuously introduced into a reactor to allow the gas to contact a metal oxide catalyst and an oxidant for a period of time. A transmitted light of the dummy patterns provides a phase difference of 0 or 180 degrees relative to a transmitted light of the integrated circuit layout. Aspects of the system may comprise a collocated device functioning as a configurator that configures a wireless Ethernet terminal functioning as a client station via a network. In some example embodiments, the system extracts data and metadata from a business intelligence file, generates a data bundle of the data and metadata, generates an application bundle based on the data bundle, and generates an interactive document using the data bundle and application bundle.

1459828094-0b62b698-c001-4833-8391-03f7e2e59294

The present invention concerns a fly fishing rod with a detachable reel and reel seat assembly. The system includes a pressing stage configured to compress powder to form a green compact from the powder, a sintering stage configured to sinter the green compact to form a sintered structure from the green compact, and a consolidation stage configured to apply electric current to the sintered structure to form the metallic product from the sintered structure. If an update is available, the update is copied from the server to the target client. The interface uses fabric packet generation logic to generate a single command packet in a protocol for the coherency fabric which consists of an address, command and/or data.

1459828094-a88dd5aa-9939-4aad-b2d4-a07d09d5c78c

The present invention provides a method of attenuating the formation or reducing the severity of neurogenic pain in the tissue of a patient via applying a composition comprising a hydrophilic foam substrate and a polymeric hydrophilic agent to a portion of the surface of the skin in an amount and at a location sufficient to attenuate formation of or reduce the severity of neurogenic pain. The hull is separate and displaced from the hydrofoil assembly and is, in use, supported above the water by the rigid beam. The organic light emitting layer includes a first organic light emitting layer, a second organic light emitting layer and a third organic light emitting layer. The recipient of the electronic message is informed of any message found to be from an invalid source.

1459828094-deb2e2dd-9db4-4548-a672-cee5d9c39e26

A communication IC in an AV controller periodically notifies plural slave apparatuses, a radio, and an amplifier ) of a system state command containing a system state in which states of all the plural slave apparatuses are managed in a lump. A method for actuating a garage door and a sensor module for preventing

movements of an assisted garage door are also disclosed. Next, a full-color frame is divided into four sub-frames, wherein the sub-frames are matched with the four color-orders one by one.

1459828094-ef78e6c8-55f7-4a97-ac37-3379693a1ec0

A logic circuit system with power consumption that is reduced by automatically varying the clock frequency and operating voltage according to processing capability imposed on programmable logic circuits. The method performs a chromatography step of loading a subject sample containing the coloring material composition to a chromatography apparatus that holds a separating base material containing a cellulosic material and a metallic oxide material, and of performing a chromatography using a mobile phase of a liquid in the analysis of the coloring material composition. The OLED display used for displaying images comprises at least one pixel comprising red, green and blue sub-pixels and arranges an OPV cell used for converting solar energy into electrical energy. Blind digital signatures based on the master pair of keys are used to withdraw digital cash from the user's bank account under the user's real identity. Unlike prior art mechanism that automatically discard stored access plans whenever the need for a different access plans is detected, stored plans are intelligently retained despite the handling of one or more infrequent queries that call for the use of a different plan.

1459828095-4265f85f-fd9c-40e8-869d-015385d9e368

A method and apparatus for increasing the success rate of a handover of a connected mode UE while minimizing the power consumption of the UE during DRX operation in a mobile communication system is provided. A stub sill includes side plates having ears that extend upward to support the tank near where the head of the tank is attached, and a head brace is welded to the side plates and to the head of the tank in a weld joint that can be continuous along the head brace from the ears of the side plate to the center of the head brace. An orientation component is provided so that the reader can sense its orientation relative to the tag. Because the belt holds the idler rollers in place, they can be of low-cost, light-weight, compact construction and require no additional support. Further, a system providing multicast services and a multicast service support system is disclosed.

1459828095-79f51665-6193-46a5-89d5-62fefc0a6821

A vapor deposition film comprises a substrate made of a plastic material, a primer layer made from a composition comprising a specific trifunctional organosilane or a hydrolysate of the organosilane, an acryl polyol and an isocyanate compound, and an inorganic oxide vapor deposition layer to a thickness of 5300 nm, formed by successive lamination on at least one side of the substrate. The second active region is formed between two of the first active regions. Zero is set at points of the modulation signal other than the signal point where the correlation becomes the maximum, so that the noise component at the zero point is extracted from the modulation signal. The live image is controlled by the user's movement, causing at least a part of the display to move in concert with the user's motion, thereby creating an enhanced three dimensional effect for a superimposed display. The remote control assembly also includes a receiver connected to the control system for receiving a signal and activating the infeed mechanism. The toe cap terminates at a position adjacent to the base of the toes of the foot.

1459828095-e9ca504e-7ebe-4d94-84d5-2269c837d2b6

A method for unambiguous determination of a range to and/or of a relative velocity of an object with respect to a motor vehicle is disclosed. The drive unit can be part of a compound loudspeaker drive unit including a high-frequency drive unit coaxially disposed within the diaphragm and a chassis encompassing the mid-frequency drive unit with the surround being secured to the chassis to form the smooth transition from the diaphragm to the surround. 9 and a glass transition temperature of 80°C. The interconnects and control circuits in the base fit substantially within an area below the array of multiple vibrating elements. The

coolant flow circuit apparatus is coupled to the coolant core portion and is configured for circulating coolant through the coolant core portion.

1459828095-f105e5ec-067c-4bf4-bd8f-5a94edf4a087

A dynamic protection system can analyze a computer system to determine its vulnerabilities to attack and generate a policy for protecting the computer system based on the identified vulnerabilities. The gap depth is 25 microns or thinner. The first electrode layer substantially completely covers the first base. The home agent may then receive a registration request message containing the HOA and a second NAI.

1459828096-2b4ba787-6651-40f0-92a9-7d1fb2c66067

In a method of and an apparatus for determining a portion of total costs of each entity of a plurality of entities, a maximum value related to a maximum number of accesses of each entity in a time window over a time interval is obtained. Much of the effect of gravity is removed and the spread of heated water may be increased. The fleece is subject to a bow-tie hydroentanglement process where many fine jets of water entangle the fibers on the topographical surface.

1459828096-4d099f81-f141-4ead-b172-b73cbf75af0a

The present invention relates to a transistor of a volatile memory device with gate dielectric structure capable of trapping charges and a method for fabricating the same. For example, a method comprises the following steps. High levels of electrical conductivity are achieved in the electrically conductive materials without stretch orienting the material. The metal pattern has a plurality of metal films. A user interface having a soft-key can be provided to cycle through various HAC options. By rotating the mirror or changing the focal length of the zoom lens, the focusing location of the light changes on the focal plane of the objective lens or in the front or the rear of the focal plane.

1459828096-afe687a5-0f91-46f1-b23d-1b664a978c4e

A safe, quiet, easy to control, efficient, and compact aircraft configuration is enabled through the combination of multiple vertical lift rotors, tandem wings, and forward thrust propellers. Certain types of extensions, such as network access identifiers, are initially aggregated and subtypes are employed to identify the precise content of the extension. The method can be generally carried out by preparing a reaction medium comprising an aqueous phase and an organic phase.

1459828097-4eb3f308-c66d-4c4d-a4af-0009b94531d9

A memory structure includes a memory storage element electrically coupled to a control element. Particles are formed on the support layer. A gate electrode layer is formed over the gate dielectric layer. The polarity protection circuit is electrically connected to the battery to be charged and to the boosting battery. The device may further include a reference layer having a fixed magnetization direction on a side of the free layer opposite the insulating layer and a tunnel barrier between the reference layer and the free layer.

1459828097-be5d6a9d-bd01-473f-b4ec-48b34ba1ff32

Methods, systems and computer program products are provided for rendezvousing resource requests with corresponding resources. , nanofibrils predominantly having diameters substantially less than about 100 nm and a method for making such carbide nanofibrils. The user feedback items describe reactions of users to the online content. Along the gantry a second gripping device is displaceable for moving workpieces between the working space of the automated cell and the machine tool.

1459828098-fab73885-06e5-427b-82fd-5d777f24afb3

An industrial brake is provided through which tension and emergency braking are initiated at opposite axial ends of the brake in order to improve packaging and maintenance of the brake and to enable the addition of an emergency brake function

to existing tension brakes without substantial modifications to the brake. The organization can be a group of users or a collection of groups. A foam gun provides for the dispensing of a foam. As a result, strong optical feedback, and thus strong resonance, may be provided in the nanopillar optical resonator.

1459828099-d53d57ff-8335-4c68-a7c5-bc3ccd577c19

Surgical micro-resecting and evoked potential monitoring system and method. The circuit tester includes a handle with a detent assembly that allows for positioning the probe at various angles for testing a device. The gasket also includes a first flexible portion bonded to the rigid portion, wherein the first flexible portion comprises a flap that is open during assembly of the heat pipe in the electronic device and closed over the heat pipe and the rigid portion to seal the duct around the heat pipe after the assembly. The deep trench capacitor patterns include first dummy DT patterns in a first column, second dummy DT patterns in a first row and a plurality of effective DT capacitor patterns.

1459828100-a2b6dacd-5ccd-4b94-bdfa-a7b046f09c11

A channel frequency response estimator for estimating the channel frequency response of a wireless RF channel having a time or frequency varying channel frequency response is disclosed. 0 of the Data Over Cable Service Interface Specifications and other audiovisual standards, that uses an analog front end having a charge-domain analog-to-digital converter that uses a charge-domain pipeline of at least two stages. The wheel is mounted to a pivotable table assembly that includes the motor and drive mechanism for the wheel. During and upon expansion the regions are stress loaded by the opposing vertebral bodies to promote fusion between the vertebral bodies through the device. Thus, when the cutting string is broken due to wear or excessive pull and is sprung toward the handles, the broken cutting string will be blocked and stopped by the protection rib of each of the two handles, thereby efficiently preventing the broken cutting string from injuring the user's fingers, so as to protect the user's safety. The retaining holes each has two open ends that are located at both sides of the ribbon-shaped connecting portion, a diameter of one of the two open ends is near a diameter of the balls for easy installation of the balls into the ball connect device, and a diameter of another one of the two open ends is smaller than the diameter of the balls so as to prevent disengagement of the balls.

1459828101-347b31fc-5b88-4493-ab27-a5969394a907

In an image processing unit for performing an arithmetic operation between a reference image and a search image, a product-sum operation section comprises systoric array, a normalization and accumulation processing section and a correlation value memory control section. The device has a supply container provided with an opening on the underside and is filled with the liquid active substance. The present invention provides the optical fiber for transmitting ultraviolet ray which has a core 5 of silica glass containing a given content of fluorine and a clad 6a of silica glass containing a given content of fluorine or boron, a clad 6b of a resin which transmits ultraviolet ray or a clad 6c having air holes H.

1459828101-3b0eaf75-676d-47c9-a846-37faec6e6469

The present invention provides a bait station and method for securing it using a receptacle for holding a weight to weight a bait enclosure and by stakes formed as a unitary part of the enclosure for securing the enclosure. The machine is relatively portable, for example, it can be mounted on a palate, and can be used at any location having an adequate electrical supply. The video output apparatus further includes a selection unit, which selects one of the video signal outputted by said video output unit and the mute signal generated by said mute signal generation unit and outputs the selected signal, and a control unit, which causes the selection unit to select the mute signal in a period including the switch performed by the video output unit. The gate of each of the decode transistors is

connected to one signal line of first and second signal lines transmitting the corresponding display signal bits and inverted signals of the corresponding display signal bits, respectively. The apparatus-side ground terminal includes a portion projecting laterally from the uniform diameter portion from an end of the uniform diameter portion toward a reading member base and an extended portion at the end of the uniform diameter portion, covered with the tapered portion. In certain embodiments, the apparatus includes a tubular cavity to provide a recessed location of the needle cannula for preventing accidental needle injuries.

1459828101-53feed61-db1f-453a-aae2-fe821916f584

The present invention is a nectar feeder for birds. A laser diode is driven to generate laser beams that are condensed into parallel laser beams by a condenser. The nickel-titanium member may have added physical characteristics providing superior flexibility. Based on an inductance-coupling effect, the feedback voltage represents a secondary-side voltage of a secondary winding. In one embodiment, the reset circuit includes a first reset circuit connected to the signal lines, and a second reset circuit connected to an output part of the driver. The main plate includes an engaging portion on the inner side thereof.

1459828101-648c9f43-4a4b-47e9-b016-75e7ae0896f0

A display device of the present invention switches between two displays, a main panel display and a sub-panel display, by using one driver IC. The bistable RRAM includes a first resistance random access member connected to a second resistance random access member through interconnect metal liners and metal oxide strips. Enclosures are sealed against ingress of atmospheric air and both maintain oxygen levels less than the surrounding atmosphere to reduce formation of scale on the strip. A wire material made of the copper-metal fiber conductor is subjected to area reduction processing.

1459828101-65c69c97-a18c-489c-97e0-f9983d455a29

Methods and systems use a programmable sign display located in proximity to a traffic light to provide information to motorists upon the motorists directing their attention toward the traffic light. The compact unary DAC cell can be combined with additional compact unary DAC cells to provide a scalable unary DAC system that may be segmented, non-segmented, single-ended, differential, or some other DAC topology that may employ one or more unary DAC cells. The windings comprises a first conductive segment disposed on a first surface of the substrate, a second conductive segment disposed on a second surface of the substrate, a first conductive via hole connecting the first and second conductive segments, and a second conductive via hole connecting the second conductive segment to a first conductive segment of the following winding. 001 to 2 parts by weight of a high molecular weight polyethylene with a molecular weight of 10,000 or higher. In one example, SIP session messages are employed for client control of server-side call forwarding.

1459828101-e3038553-8db9-4a52-87ea-5442f5cc6f33

A device for attachment to a bicycle which includes a flat strap of semi-rigid plastic a substantial portion of which is straight terminating in a free distal end. A peak sensitivity wavelength of the light receiving part is in the range not less than 760 nm and not more than 1100 nm; at least one of the plurality of light emitting elements has a peak emission wavelength in the range not less than 760 nm, and at least one has a peak emission wavelength in the range of 400 to 760 nm. The prepolymers have lower viscosity and better storage stability as compared with those from conventional branched polybutadienes of the type. A movable ejector pin is disposed on the supporting shelf and along the midline of the U-shaped opening. In some aspects, a battery pack including a housing, a cell supported by the housing and power being transferable between the cell and an electrical device, a circuit supported by the housing and operable to control a function of the battery pack, and a heat sink in heat transfer relationship with the circuit and operable

to dissipate heat from the circuit. Furthermore, the area of the logic circuit can be reduced by stacking a transistor including an oxide semiconductor and a transistor including silicon.

1459828102-87be4910-e4b4-47b5-8ae3-56ea650cfb0f

A method and system for extending an extensible framework is provided. In that case initially the first metal workpiece and the second metal workpiece are placed one on the other on a processing surface of the counter-tool and aligned. In other aspects, the invention pertains to a system for introducing a urinary stent into the body of a patient. An inlet opening is formed on a surface of the body for supplying inhalation gas to the nose through the chamber. In addition, character data of a word or phrase in a document is designated. Next, a flexible layer is formed on the display layer and patterned if desired.

1459828102-9e36f3f9-77e6-44c7-977a-aaceee483e94

A connecting system for connecting a first mesh sheet to a member comprising a housing member, a first loop portion, and a first pin member. The first surface has a cylindrical surface with a length and a first diameter chosen to propagate TE<sub>11</sub> modes for both a low frequency band and a high frequency band. Zoom switches 5 and 6 for operating the electronic camera, and a shutter 7 are arranged in a position out of the center in a longitudinal direction of the side. When the data is judged to come under the predetermined category, the storage unit stores the locating information and collects pieces of locating information for locating where the data exist. The friction-reducing layer comprises a metal salt.

1459828103-26ea4c60-f50a-4050-9d70-81061f1596ce

A system facilitates two-way messaging in a network that includes at least one paging device. The present invention achieves the above object by a method of permeating of maltose and/or  $\alpha$ -D-glucopyranosyl- $\alpha$ -D-glucopyranoside or saccharides comprising the same and other oligosaccharides in a prescribed ratio into the above food containing gelatinized starch by admixing the saccharide to the food and holding them at relatively high temperature for a prescribed period. One of these sensors are selected by carrying out calculations on signals outputted from the sensors. A parabola waveguide length  $Z_0$  exists in a range  $Z_a, 0 = Z_0 = Z_p, 0$  determined by a parabola waveguide length  $Z_a, 0$  where the ratio of absolute amplitude between the main peak and the first side peak in the field distribution of far-field of the parabola waveguide has an upper limit of 0. The package is used to produce protective clothing, in particular protective vests, suits, and mats. For each memory cell in the respective portion of the storage medium, a memory controller is configured to perform a plurality of sensing operations and obtain results from the plurality of sensing operations, where the plurality of sensing operations includes sensing operations using a predefined range of offsets from a previously established reading threshold voltage.

1459828103-b545774b-6bd7-4108-90eb-5bb15c06d4dc

In a multi-core system, multiple packet engines across corresponding cores may be working concurrently processing data packets from data flows of SSL VPN sessions. A plurality of adjustable rods segments extend between the plurality of securing members. A voltage for back gates in the logic circuits having a small load in the logic circuit block is controlled in response to activation of the block from outside of the block. A first plunger is sized to pass through the first chamber section and not the second chamber section. A lever side outer ring of the lever side clutch section is formed of a thick plate-like member formed by punching. If the default preferences permit the requested access, an access rule is created dynamically and the client's request is filled, without interrupting the user.

1459828103-c83c73e5-606f-46a2-b7f4-657ff4dfd9cf

A photopolymer plate manufacturing process utilizes a modified substrate and mask to generate pre-cut and interchangeable single and multi-part stamp dies. The

container provides access to an inner cavity that receives a bag with opened and closed ends. An electron-emitting device made up of device electrodes, a conductive film, and an electron-emitting portion 5 is formed at each intersection between the row-direction wiring line and the column-direction wiring line.

1459828103-fb92bd11-6f7c-415b-aae9-f752f5021ec3

An induction foil cap sealer includes a sealing head module and power supply module that can be separately mounted and replaced. According to the thus provided alloy powder raw material, the maximum size of the powder particle is not more than 10 mm and the minimum size of the powder particle is not less than 0. The thermal elements upon supply of a current are capable of either heating or cooling the image capturing device or a platen of the image capturing device. Services are provided can read the stored encrypted location data, processes it to determine if group members are in the same vicinity, and either respond to user queries about the location of other members of a group the user belongs to, or push this information to appropriate users.

1459828104-05b2a1ed-a162-4ac1-bd0a-0c00cff8a30e

The invention provides a phosphor composed of  $5\text{SiO}_4\text{M}_2\text{X}_6+2\text{Y}$ , wherein M is Ba individually or in combination with at least one of Mg, Ca, Sr, or Zn; RE is Y, La, Pr, Nd, Eu, Gd, Tb, Ce, Dy, Yb, Er, Sc, Mn, Zn, Cu, Ni, or Lu; X is F, Cl, Br, or combinations thereof; 0. A first fitting is provided that overlies the rail and a second fitting overlies the rung. The status detecting module detects a connection status between the client and the network device.

1459828104-106a97b2-525d-4fe1-94fe-700099bbddc1

The present application is directed toward fire-rated wall construction components and wall systems for use in building construction. Herein, distances between the side surfaces of the both ends of the magnetoresistive element and the side surfaces of the bias magnetic layer viewed from the protective film do not exceed 3  $\mu\text{m}$ . The movable elements of the surface micromechanical structure are exposed by removing the first sacrificial layer.

1459828104-5fae8892-c1d5-4008-9ee7-ed8f62e4b579

A method and system provide a magnetic transducer having an air-bearing surface and at least two read sensors. A determination is made of the spectrum characteristics of a radio environment in the vicinity of the broadband powerline communication system that is transmitting data on modulated carrier frequencies. The storage device receives data from a host device, and stores the data in the user partition.

1459828105-0d0e9339-63d9-4fa7-94f8-4fe085275f60

A method of operation of a navigation system includes: detecting a location reading; selecting a route having a current edge with an endpoint and a shape point; predicting a navigation instruction based on a calculation with the location reading, the shape point, and a time delay for the calculation; and displaying the navigation instruction on a device. According to one aspect, step-by-step execution of an instruction sequence is implemented where each instruction is guarded. The searching system then searches the required web site for the users by using complete comparison or fuzzy comparison and displays the content of searched homepage to users' browsers. Near the upstream end, the main plenum includes an aft switchback, and, between the aft switchback and the downstream end, a forward arc. Then a matching scheme is selected from the defined matching scheme such that the calculated cost is the minimum among the calculated costs of the defined matching schemes. The present invention solves the problem by providing a gas barrier substrate having a base material, a planarization layer formed on the base material, and a gas barrier layer comprising a deposition film formed on the planarization layer.

1459828105-71ce6a09-e9fe-4453-ac98-069252cdb8f4

A humane animal trap includes an enclosure having an opening with a door disposed therein. In this transmission system, an instantaneous power amount is calculated, and is compared with a preset upper limit value. By transmitting the data from the video receiver to the remote control unit, the information is available to the user without interrupting the display on the user's video receiver.

1459828105-8548a4b2-ef7b-4aa4-a66f-75cd94aec169

A practical means to position and adjust the parts of a grand piano's action outside of the piano to fit and play properly, precisely, and as expected in the piano. The system includes a moving picture encoding device 1 that includes a block divider 102 receiving a target pixel signal, a prediction signal generator 103 producing a prediction signal, a subtractor 105 producing a differential signal, and a transformer 106 and quantizer 107 producing an encoded differential signal. Furthermore, accurate volume may be applied to particular voices dependent on their location relative to the player and the game may be controlled using voice commands.

1459828105-8580e790-e6b1-42f9-9c89-18be92f7add4

This invention relates to MRAM technology and new variations on MRAM array architecture to incorporate certain advantages from both cross-point and 1T-1MTJ architectures. The method also includes forming an inter-poly dielectric of a spacer shape on an inner wall of the control gate, filling a conductive layer for a floating gate between the spacer shaped inter-poly dielectrics, and forming an interlayer insulation layer over a resulting product formed with the conductive layer for a floating gate. The external housing includes an annular base plate, an annular dome shaped light diffuser, a tubular pole guide having a central bore, and a locking ring. In a valve-actuating position, the rotary sleeve drains oil from the deactivating mechanism so that associated engine valves are operated normally. Such a gasket has been found to be extremely efficient and appropriate in hygienic food processing systems, which in the past have relied heavily on elastomeric gaskets. The connector assembly includes a pin, at least one ring and a sleeve composed of an insulative hard polymer molded between the pin and ring such that the sleeve provides electrical insulation between the pin and ring and mechanically couples the pin and ring.

1459828105-8ce9e75a-cf10-4334-beb6-ab007c8b8c6f

A sample preparation device for reducing a concentration of one or more concomitant components of a sample and/or increasing a concentration of one or more desired sample components is described. The anchoring post presents a post section and an anchor section, wherein each anchor section is configured to angle away from the longitudinal axis as the anchoring post receives a force that drives the anchor section into the ground. The feed device is arranged to thrust the tool and the bit against the rock to be drilled, whereby on drilling at least part of the compression stress wave generated by the percussion device to the tool reflects from the rock to be drilled back to the tool as tensile stress, and impact energy of the percussion device is adjusted on the basis of the level of tensile stress reflecting from the rock. The optical-microwave-quantum transducer can include a gap between the optical region of the first and second nanophotonic slabs that forms an optical cavity in response to an optical signal, wherein the optical cavity can induce mechanical oscillation of the first nanophotonic slab about the axis of rotation.

1459828106-259a113e-2813-47d4-a70b-ab9cb4755eac

A curved display apparatus includes a projector, first and second mirrors, a curved screen, an infrared illuminator, an infrared camera, and a controller. A pointer contact data generator generates pointer position data in response to pointer contact with the touch surface. The resource transmits the retrieval key to the transport network. The ink circulation system is constructed so that at least a part of the ink passed through the first supply piping is directly ejected to one

of a surface of the filter on an ink jet head side and a surface of the filter on a gas-liquid interface side.

1459828106-51d3d077-1200-47f2-b0c8-d6371c7b165c

Electrically conductive films comprising a flexible support, an extensible metal or metal alloy layer, and a crosslinked polymeric protective layer have at least one permanently deformed curved region. The cold gas, and its application, covers both coated and non-coated part. A control is performed to cause the reeling roller 32 to reel the sheet-like member 31 in accordance with the ejection number of the ink which is measured by the measurement unit.

1459828106-534bd6f2-9cc8-4ff5-b8c1-7eecd24d0a72

A method and assembly for mounting power electronics modules in an equipment cabinet, cubicle or other like equipment space. Data is replicated on a recovery site from a production site. The exerciser leans away from the door, and does an exercise while holding the grips and leaning so that the weight of his body serves as resistance for the exercises. Thereby, a call connection is formed to an appropriate public safety answering point. When the electronic device is updating, the BIOS switches to electrically connect to the network connection module via the switch, and the network connection module connects to the server by executing the connecting program, downloads the update data applying to the BIOS, and overwrites the update data to the BIOS to update the BIOS program.

1459828106-badacd3f-d0d0-4ba9-b5de-6cfc59cc9abd

A dual function adjustable hand tool including a head device having a hollow and a room. A sensor is placed inside or on the patient's body. The CPU refers to toner remaining amount information stored in a memory of a cartridge and determines whether there is a sufficient toner remaining amount in the cartridge. Loops formed on the top of the legs provide a mechanism for pulling the plant cage out of the ground and handling the cage. The actuation mechanism of the system consists of six muscle like actuators which are co-activated to modulate the stiffness at the joints.

1459828107-49bad694-4879-4a49-bdad-259de78a0f02

An actuator, in particular for operation of fuel injectors in fuel injection systems of internal combustion engines, has in this embodiment a plurality of layers of a piezoelectric or magnetostrictive material arranged in a stack. Each of the battery blocks has a plurality of parallel strings of battery cells connected thereto. The second acoustic resonator has a second electrical impedance and a second resonance frequency, and includes a second set of electrodes, and a second piezoelectric layer having a second thickness, wherein the second piezoelectric layer is disposed between the second set of electrodes. The alkylation systems further include a first alkylation system adapted to receive the first output stream and contact the first output stream with a first alkylation catalyst disposed therein and an alkylating agent to form a second output stream. A specially formulated highly lubricious material is utilized for the poly walls to enable rapid clean out of the container. The heat radiating member radiates the heat received by the heat receiving member.

1459828107-b5555836-e5d1-4cfd-a977-5c81f0c0340b

A filter device for the filtration of compressed air, which is provided with a filter means able to be deinstalled for cleaning and/or renewal purposes. More particularly, the methodology of the invention provides an elongated virtual Transmission Time Interval for the first few non-compressed packets of a packet stream transmitted using ROHC compression. The initiator has a molecular structure comprising aromatic rings, carbonyl groups connected to the aromatic rings, and substituted moieties connected to the aromatic rings. The apparatus comprises a processor, communicatively coupled to a display and a user input device, and a memory, coupled to the processor, the memory storing instructions for concurrently

displaying a playing hand having at least one card and a representation of at least one card issued in a previous hand.

1459828107-d20b3efa-4685-4629-a66b-a18622d5a448

In a multi-threaded processor mobile device, power consumption is reduced by matching a number of active processing resources with the data rate capability of a serving base station. The crane is configured such that during crane operation, the moment generated by the counterweight unit acts on the rotating bed predominantly through the counterweight support frame. The solid block detergent contains a package of surfactants including a neutralized anionic surfactant with either one or a mixture of an alkali and alkaline earth metal salt thereof and an alkylpolyglycoside. Wherein the first and second fields of illumination spatially overlap and intermix with each other and are substantially coplanar with the FOV of the linear image sensing array. The repair material may be attached to a securing portion that extends from the annular portion.

1459828108-15d3b401-ba37-44b5-ae1c-495c22c0f854

An automated banking machine operates responsive to data read from data bearing records, such as user cards, to cause machine user authorization and financial transfers. The reader reads the contents data. A special valve stem sleeve may be provided to enhance the sealing of the valve stem. Any desired artistic design cutouts may then be routed or lazered through the front face section and through the first interior surface into the longitudinal groove.

1459828108-56f69736-e06e-4d5d-8c29-e7e34bdbdbab

Provided is a storage system having a host system, a first storage controller and a second storage controller. The print manager is operable to activate the guillotine upon receipt of a signal indicative of a manual attempt to pull the print media from the camera. The quantity of data is provided to the host. The shading member is movably arranged within the black-body condition space.

1459828108-8d3f4a45-c6c8-4e50-9a5c-ddc72179316e

In a shift system wherein the transfer of power is performed using a motor, the smaller the gear ratio difference is, the smaller can be made the motor output. An oscillating signal is transmitted through the first electrode, and at least a portion of the signal is received through the second electrode. The tissue anchor further includes a length of suture material having a first end affixed to a distal end of the inner member and a second end preferably affixed to a suturing needle.

1459828108-90197e55-141a-4e57-aa3c-50132b89c682

Operation of a vehicle is controlled based on the presence of or absence of one or more identified foreign objects within one or more monitored zones about the vehicle. A positive electrode extends through the insulator. For a macroblock one of the available macroblock-segmentation\u2014prediction-method pairs is selected, and thereafter the macroblock is segmented into blocks and prediction motion coefficients for the blocks within said macroblock are produced using the selected macroblock-segmentation\u2014prediction-method pair.

1459828108-a10c113b-abf5-439c-8482-72693a42fe76

A medical bandaging product having a moisture curable hardening agent and a flexible liquid-permeable braided and/or tubular fabric substrate for casting or splinting, a method of manufacture of such a medical bandaging product, and a bandaging system comprising such a bandaging product within a moisture impervious package with means for resealing the package. An axle may also be mounted in the housing. This allows the blade to be freely rotatable through at least a predetermined angle. An overheat protection circuit indicates that the balun is abnormal when a temperature of the balun exceeds a temperature threshold. Frequency components of the phase-compensated samples are then computed using a frequency analysis such as a Fast Fourier Transform. Multiple PEs can generate condition

information at the same time with the programmer being able to specify a conditional execution in one processor based upon a condition generated in a different processor using the communications interface between the processing elements to transfer the conditions.

1459828109-5443c645-f804-40f4-a221-8a31924cd445

A vehicle lamp can include a position lamp with a favorable light distribution. Before canister purging is stopped by closing a purge valve, a canister vent valve is closed to hold fuel tank vacuum. In the heat radiating member, a heat receiving piece of a first heat radiating section and a heat receiving piece of a second heat radiating section are combined with each other to form a heat receiving section, and a heat transfer piece of the first heat radiating section and a heat transfer piece of the second heat radiating section are combined with each other to form a heat transfer section. Fastened to the outer sheath is a handle mechanism comprising a handle frame and a lever, the lever having teeth for gripping the ribs of the inner telescoping portion.

1459828109-a218c8a7-b2b0-418b-a5ab-655cbb5d2739

A spring counterbalance apparatus and method consists of a shade system with a torque profile, where the shade system is connected with a drive shaft. The plurality of rolls includes at least one elastic roll. A sheet member of a liquid supplying port of the fixing liquid bottle is broken by an insertion pin provided in the printer main body in synchronization with the attachment of the replacement unit to the printer main body. The strap has a first end and a second end, whereby the first end is fixedly attached to the sidewall and the second end is selectively secured to the bottom wall. Additionally, the ferromagnetic cells provide for indefinite number of switching actions on the data without degradation to the capacity to store data therein, or eliminating write fatigue. It is recognized that increased benefits may result from multiple dosing, including intermittent dosing.

1459828109-fcd4fe8c-9ff8-45ef-b9ec-087bbbd668c5

A process for the manufacture of an acetylenically unsaturated alcohol comprising reacting formaldehyde, an aldehyde or a ketone with acetylene in the presence of ammonia and an alkali metal hydroxide, the molar ratio of the alkali metal hydroxide to the carbonyl compound being less than 1:200. The checking mechanism then determines the critical operating parameters of the identified ESD devices and determines if the parasitic devices will negatively effect ESD protection performance. In some embodiments, an apparatus is provided for use with video data. A blocking insulating layer is provided between the charge storage pattern and the gate pattern. If the data checked by the system management processor is corrupted, the system management processor repairs the corrupted data before removing the system processor or processors from the reset state. The flexible wiring cable 60 connects the output side wiring pattern of the IC chip 61 to the relay board 50 via FFC 63, thereby decreasing the use of more expensive COF 62 by the use of cheap, general purpose FFC 63.

1459828110-68d88579-a70d-4203-bc15-de815e1a0e06

Methods and systems are provided for obtaining information via a plurality of platforms communicatively linked together via a communication network. Exhaust gases flow through the CO<sub>2</sub> sorbent bed before being released into the atmosphere. Upon receiving an instruction of reporting a simulation result, snapshot simulation result reporting means 22 reports a physical disk capacity of the snapshot calculated by the snapshot simulation function. The plasmonic near-field transducer includes an enlarged region and a peg region.

1459828110-a6e0f100-49a3-48ef-bce7-7f0f3c677408

This invention discloses improvements to a damper of the type used in industrial applications to open and close ducts carrying noxious or corrosive materials, such as combustion by-products. The insertion element has a stem and a head containing

an aperture large enough to receive a graft. An edge is detected from the image as a second characteristic. There is provided a rotation link 61 of which one end rotates on a rotation center axle 65 and the other end thereof slidably connected to the barcode sensor holder 59. Sub-grammars may be included within the grammar to recognize speech from sub-portions of a dialog with the user. The cable includes an elongate base substrate including a dielectric layer with an upper metal layer deposited on one side and a lower metal layer deposited on its other side.

1459828110-d79a15c5-2cf2-4f24-9ba1-b9862804175c

An apparatus including an electrical switching device to control current to a load and a second case arranged to substantially encapsulate the electrical switching device. The circuit includes a control chip. The sensor circuit is configured to monitor at least one of a return electrode pad property and a tissue property to generate sensor data. A glide notch is formed in the right wall. The lubricating films contain sulfur as coordinating atoms and therefore, extreme pressure produces sulfur radicals through decomposition by tribo-chemical reactions. The interlayer insulating film on one of the pair of substrates extends to a surrounding region of a display pixel area.

1459828111-9580383b-0573-432b-8923-96e382cdf874

An arrangement that includes a transmitter unit and a receiver for locating a circuit interrupter associated with a selected branch circuit of a power distribution system. The projection system projects, using the first projector, a first guide in a position a predetermined amount of a margin spaced apart from a border of a projection region where an image is projected and projects, using the second projector, a second guide distinguishable from the first guide. The first and second loops of the assembled strap may form a figure-eight design. Each set of display mode information shows a species of display method according to which the frame data is to be processed for a case when the frame data decoded from the main video data is displayed at one of the plurality of aspect ratios.

1459828111-9fdc21a5-abae-4b73-98bb-5dd8f90d4129

A diagnostic golf club system having a diagnostic golf club, an interface means and a computing means is disclosed herein. Uncoated calcium silicate exhibits a high pH level that may have a deleterious effect upon such cosmetic and/or personal care compositions, thereby rendering the overall composition ineffective for its intended purpose, particularly if the calcium silicate is present in its usual state at high loading levels. If the thickness of the metal ring assembly is represented by TL, and the vertical opening of the ring slot is represented by D, when the value of DTL exceeds 118, the power transmitting efficiency is reduced. At least one of the adhesive sheet, the circuit member, the spacer sheet, and the front sheet has flexibility. The remote station receives and combines the first and second transmission signals transmitted by the remote station to provide a combined encoded signal. The exchange of information between the Web browser on the management station and the devices in a cluster is accomplished via redirection of HTTP GET and POST methods.

1459828111-bb7b1174-8396-4e6c-8d1f-f5785a8eeeee6

A computer implemented method and system for accelerating advertising placement decisions is disclosed. A minimum amount of uplink resources is allocated to each user requesting E-DCH service on an individual user basis such that a cumulative E-DCH power allocation satisfies a selected minimum E-DCH power allocation threshold. Preferably, the second composition will have a higher viscosity than that of the first. The present invention provides a multiuser detection process and apparatus that is capable of pulling apart signals in heavy interference in real time by combining the signals received from two or more spatially separated collectors or antennas. The deoiled spent catalyst is slurried in a hydrocarbon medium as dispersed particles prior to being fed to the heavy oil upgrade system.

1459828111-c24377df-8870-4083-a8c5-cc7d7bc99460

A method of controlling an apparatus which is capable of determining a dot disposition of a copy-forgery-inhibited pattern image is disclosed. An actuator is coupled to the first adjustment arrangement and to the second adjustment arrangement. A heater in exhaust gas lines of a heat reduction furnace in the coal-based direct ironmaking process superheats the steam generated by and exhausted from the waste heat boiler. , within a slot 417 in the lower body, and configured to secure the housing to the base in the one of the multiplicity of angular rotations.

1459828112-16521dcf-e798-40f7-8f8b-704ad3e64ac5

A gas turbine engine strut segment includes a strut, which may be hollow, extending radially between co-annular radially inner and outer platforms, axially spaced apart inner platform flanges extending radially inwardly from the inner platform, and axially spaced apart outer platform flanges extending radially outwardly from the inner platform. The gearbox includes a differential assembly driven by a planetary-type reduction unit. After formation of the waveguide, a field-assisted annealing is carried out to move the waveguide away from the surface of the substrate so that it is buried in the substrate. The gates are connected with one another, the sources are connected with one another, and the pixel electrodes are connected with the drains. Since the pressure loss is thus made small, a drop in the efficiency can be prevented.

1459828112-2e069af1-3756-4316-a1fc-5a7a9dab97e8

An apparatus and method for dynamically adjusting power limits for processing nodes and other components, such as peripheral interfaces, is disclosed. These properties are for a given dielectric derived from measurements of the chemical bonding of that dielectric. The multi-carrier communications system is able to vary the interleaving rate based on input from a user or from data that it maintains from actual network performance. All embodiments contemplate selectable removability, replace ability and interchangeability.

1459828112-68a49e93-5085-4631-a36b-1622fd5156f4

A method for searching a corpus of documents, such as the World Wide Web, includes defining a knowledge domain and identifying a set of reference documents in the corpus pertinent to the domain. One light source is a monochromatic light source producing a light with a peak wavelength of about 580 nm or above. After the selection signal applying, a first current according to the held voltage is supplied to the organic EL device, and this emits light at luminance according to the first current. Further, trusted systems applications can exchange the V-SubId for a subscriber identifier associated with the user equipment. An application of the transfer function can compensate for one or more of an amplitude mismatch between the first and second generated signals, a phase mismatch between the first and second generated signals, and one or more frequency handling characteristics of channels used to produce the first and second demodulated signals. The present invention provides a testing method for an optical information medium using the artificial fingerprint.

1459828113-19dbb5ce-7676-4d7c-8cf9-0335ab257cb9

Synchronization methods, apparatus and systems are disclosed. The bus further enables the wireless connection of peripheral components to a computing device, thereby providing a distributed computing device. Then, from among a plurality of divided sub-frames, data read in during the first divided sub-frame period is stored in memory of each pixel, and the stored data is read out during other divided sub-frame display periods and display is performed. A preceding coded signal is used as a feedback signal and a feedforward signal for enabling natural numbers to be used as the result of coding, thereby markedly improving the secrecy security of coded signal. The auxiliary recording layer is exchange-coupled with the adjoining first recording layer and second recording layer.

1459828113-29afb4a9-770a-4b06-bf4f-1745ed6520b9

A method for synchronized transmission of audio data streams in a bus system, for example, based on the IEEE 1394 Standard, and a circuit system for performing said method including at least one data source and at least one data sink. After two data are sequentially stored in a main register and a cache register provided in a page buffer, they are respectively transferred to an even bit line and an odd bit line at the same time, and a bias needed for a program is applied to cells connected to the even bit line and the odd bit line, respectively, whereby the program is performed at the same time. A graft vessel is attached to the mounting structure either directly or by means of another mounting structure attached to the graft vessel.

1459828113-3d23870c-c6ee-447e-acf7-83a98afc5700

A highly uniform vinyl compound polymer-cross-copolymerized olefinstyrenediene copolymer excellent in processability, mechanical properties, high temperature properties, compatibility and transparency, and its composition and a process for its production, are provided. The new variety is a Weigela, normally produced as an outdoor ornamental plant for containers or gardens. A tape is attached to a first side of the thick die pad and the power die is attached to a second side of the thick die pad. The comparator is electrically connected to the N counts of output buffers, compares the N counts of bit signals sampled at a first time spot and a second time spot, and generates the delay signal according to the comparing result.

1459828113-a8564216-362f-4a47-bbd9-ee7f5c1751eb

A method and apparatus for redriving a data signal adjusts a sampling clock signal responsive to the data signal. A display area in which pixels are provided in matrix, a scanning line drive circuit for driving scanning lines, and a signal line drive circuit for driving signal lines are provided on a support substrate. Roving is disposed in borehole piercing first beam 111A Free ends of roving protrude from borehole openings and are splayed apart into individual filaments.

1459828113-ccc80fbb-f96b-4b44-9027-46fc00ce09eb

A lamp having at least a portion of a body formed of translucent material defining a hollow chamber within which a low light level light bulb is housed. The composite bonding layer is formed when a support substrate including the substrate and a first bonding layer is bonded to a lamination structure including the LED, the first electrode and a second bonding layer. An additional embodiment is disclosed which shifts automatically dependent upon the rotational speed of the wheel. The method also includes selecting at least one of the access requirements, and storing the scrambled program and the selected requirement. The image sensing unit captures a first image at a first time instant when the light is projected onto a reflection surface.

1459828114-3d29495a-7f98-44fe-9309-96b98a3eceb7

Embodiments of methods for improving electrical leakage performance and minimizing electromigration in semiconductor devices containing metal cap layers are generally described herein. Mounting clips integrally carried on the cover snap into and fix the window in the cover aperture. Accordingly, multimedia service information and content information can be stored in a tag by being written to tag information using a common format, and thus the user can later execute a service operation by easily writing information of a desired service operation to a tag and then simply connecting the tag to a tag reading device. For each candidate, the scheme constructs algebraic constraints by applying statistical histogramming, segmentation, or clustering techniques to samples of column values. A sense circuit compares the output current detected with a first predetermined limit value in another step.

1459828114-5a0dcc69-29ce-4492-9210-f6a98a1eb361

A system, method, and ticket for a lottery player to increase a payout received for winning a lottery game is disclosed. The central spring system can be adjusted to vary the hardness of the seat part. Such transitioning is effectuated in order to protect the network against attack while providing seamless communications with respect to the communicating device. A selection unit connected to the quality and delay units and being arranged to determine, for each slot, which of the user nodes is to use that slot based on the channel quality indication and the delay factors.

1459828114-d594b294-a108-46d4-98b4-59dd9992ff51

Sending electronic messages related to a tax return from a mobile communication device of an accountant or client. The memory device includes a matrix of memory cells adapted to store data and arranged in a plurality of bit lines, the bit lines extending along a first direction; a page buffer adapted to interface the matrix with a downstream circuitry, the page buffer comprising a plurality of readprogram units. Thereafter, the curtain airbags of the vehicle are reliably activated.

1459828115-0f0ac6c2-de3e-4894-b51a-e9b27bf61956

Described is a rechargeable lithium ion battery comprised of a negative electrode and a positive electrode both comprised of a current collector and applied to each a mixture of chlorinated polymer blend and lithium intercalation materials and a separator polymer electrolyte comprised of chlorinated polymer blend and filler. The compression and retraction movement of the compression-retraction member is generally achieved by means of a pinion and a rack system, and can be utilized in conjunction with dampening means. , improved flux compatibility, improved flow properties, improved voiding properties, and the like. For instance, a rehabilitation device may be operated at a relatively low power setting to allow a patient to use his or her own muscle power when moving with the rehabilitation device. The transistor further includes a first diffusion region and a second diffusion region to provide a channel region in the body region between the first diffusion region and the second diffusion region. The operational state of the system may alternately be toggled from off to on, or from on to off, with each subsequent nonverbal input.

1459828115-5c4ef806-4915-47e1-9e3c-ee0493a5e262

The present invention relates to polythiophenes, particularly regioregular head-to-tail poly, block copolymers made therefrom, and their methods of formation. Further, it aims to provide a surface modification method which permits surfaces of different surface free energy to be obtained. Methods of treating or preventing ocular pain using said compositions are also disclosed herein.

1459828115-6b6452f9-054f-44f2-b76f-6a185400ea3a

Compositions for the treatment of wounds and skin injuries are described. The system may include a tracker local to a first ISP network configured to select edge peers among local peers of the first ISP network. The proxy base station further establishes a connection with second communication station such as a landline phone.

1459828115-9f68e16f-1aab-4fae-8185-1c5fe9b44e16

An apparatus is described for the intermittent drive of a spindle for a workpiece fixture, especially a forging machine, comprising a traction gear consisting of a traction means guided endlessly about a driving wheel and a driven wheel, a continuous rotary drive for the driving wheel and a superposition drive performing rotary oscillations. The filter is balanced on both sides, is electrically symmetric, and comprises a four-pole reactance series element, which can be formed from two two-pole pole reactance elements or from a four-pole reactance element, and a resonator. A regulator 19 supplies, to a PA 202, a voltage which is controlled in accordance with an amplitude signal to which a second offset value has been added. According to one aspect, the textured image is obtained by scanning one or more texture images into memory.

1459828115-a8481e59-15a2-4e55-bbfd-88e8028bf181

The present invention provides system and method for a group priority issue schema for a cascaded pipeline. In addition, error diffusion processing is made for all thickness regions. The optical transmitter module further comprises conductive pins that are attached to the housing structure such that the conductive pins extend from the housing structure in a second direction, which is substantially perpendicular to the first direction. The type of use of the vehicle is determined.

1459828115-ba0a6b43-faf3-4dee-a3f4-34486597be81

The invention provides methods and materials for using apatite chromatography supports to dissociate and remove contaminants that are complexed to biological products. According to the method, capacitances in a first resistance-capacitance extraction corresponding to a circuit are modified. The fluid vessel comprises a first laminate barrier layer comprising at least one layer of a biaxially oriented thermoplastic polymer, a portion of which is formed into a modified dome shape, and a planar second laminate barrier layer. In yet another embodiment, the simulated exposed roof rafter end comprises an architectural design at a distal end and a cradle at a proximal end having a shape which is complementary to the profile of a conventional rain gutter to thereby cradle the rain gutter and provide support thereto. Cursor position is positioned by an interrupter disposed in a ring of optical emitters and detectors, whereas depending on the position of movement by the positioning interrupter emission is blocked, or partially blocked, between a particular pair or pairs of emitters and detectors, that particular pair or pairs being the direction of cursor movement. Additional uniformly distributed layers of routing network lines are implemented to provide connectability between different prior layers of routing network lines.

1459828116-3cf5008a-a909-432f-b52d-9d6499bb5b30

A method and system for providing protection from exploits to devices connected to a network. Each framework facilitates issuance and execution of a command that originates from a first federation participant and that is intended for execution at servers of a second federation participant. The second bump electrode is provided at a region of at least one of the plurality of conductive wirings other than the semiconductor mounting region.

1459828116-7835575e-0991-4fa1-a1ed-a983e1068eb7

A method for identifying document edges collects a predetermined number scanlines of the document against a light backing and a dark backing. Embodiments are described where the image mapping system is used for visualizing high dynamic range images such as medical images, satellite images, high dynamic range photographs and the like and also for compressing such images. According to embodiments, linear interpolation and/or extrapolation is provided with respect to windows sized differently than constraint images provided by a developer. The beam rotates around an axle during interaction with the holders. Pneumatic suction is applied through the lumen of the extractor and the suction serves to bring the foreign object into contact with the adhesive coated surface of the extractor to form a bond between the extractor and the object to be extracted. The barrier layer prevents the formation of a silicide material within imperfections or voids which form passages through the thin dielectric layer when the device is subjected to a high temperature anneal to form the silicide contact from the reaction of the silicidable material and the silicon-containing substrate.

1459828116-9d204082-2fa8-4e17-89c8-aab56b73383d

The present invention concerns a device and method for transmitting multiple optically-encoded stimulation signals to multiple stimulation sites, especially cell locations. In a motorcycle, a crank case, an engine, including a cylinder that extends forwardly from the crank case, and a housing box are arranged under a seat. In operation, the processor control circuit receives instructions from the main

controller and causes the processor on the processor circuit board to run a test routine.

1459828116-e622ef4c-ea6a-4835-a007-b673735dbeff

Systems and methods for placement of dummy metal fills while preventing disturbance of device matching and optionally limiting capacitance increase are disclosed. The housing has a chamber defined by a cylindrical sidewall and an endwall with apertures. The diaphragm 1, permanent magnets 2 and 3, conductor circuit 4, spacer 5, and iron plates 6 and 7 are installed in a baffle 8. The test results are conveniently grouped for ease of evaluation of the test feedback.

1459828117-08016a5b-6972-4d3c-8935-0afa5c5516d0

An integrated CMOS image sensor comprising pixel rows integrated on a substrate, each pixel row having pixel circuits, each pixel circuit providing a voltage signal in response to absorbed photons; and an opaque layer deposited above the pixel rows to define a set of dark pixels for each pixel row. Said immobile phase comprises a carrier coupled to a 2-mercapto or 2-hydroxy alkanoic acid. A control fluid can be supplied to the control pressure space through the control element via a control fluid nozzle.

1459828117-0a06390c-5c72-4909-b284-c42f204ec090

A distributed network system includes at least one server having memory and one or more processors. The flange means has, along its periphery, flanged coupling portions for connecting two duct elements, each of which is provided with a coupling ring, by means of external coupling means configured to engage with the flanged coupling portions. A process of allowing a DBACN to collect bandwidth request information from DBACNs or ONUs in its immediately lower stage is performed sequentially from the lowermost DBACNs to the uppermost DBACN. The first and second RCUs implement the voice call based on the assigned first and second agent addresses. The invention also pertains to the use of said salts in maximized radiation sensitivity for imaging, radiation dose measurement or mapping and detection of radiation fields.

1459828117-24411569-6968-4402-af80-0ed368069b38

A signal processing method performs operations of coherent processing making it possible notably to purge the useful signal of the spurious signals, to regenerate the transmission signal and to perform a coherent integration of the signal received by computing the cross-ambiguity between the signal received and the regenerated transmission signal. Information representing a load of glass panels is used in controlling a treatment process, such as heating of glass panels, or in monitoring production. The safety interlock comprises a first lock moveable from a first position to a second position only if both the catheter and the treating element cartridge are secured to the transfer device.

1459828117-434f1aa5-224c-400a-bd6f-2284734d4681

A hierarchical distributed search mechanism is integrated into a distributed file system. The cooking apparatus comprises a cooking surface, at least one grate, and a guard. A heat-conducting filler is filled between the coil end group and the bracket. An image of an object being stamped by the seal is photographed if the pressure indicates that the seal is being pressed.

1459828117-67adeb47-32fd-4ca2-9fca-23fc01b163a9

A disk drive receives a request to write at least one block of a first block size, wherein the disk drive is configured to store blocks of a second block size that is larger in size than the first block size. The industrial robot comprises a robot arm and a robot control device for moving the robot arm. A cradle may be positioned in the body to contact the vertebral rod. A second 2-bit ADC also receives the data and outputs odd symbol data in accordance with a fourth phase of the four-phase clock. The wet etch process is then applied to the phosphorus doped oxide for the

A multi-actuator disk storage device has at least two actuators respectively

mounting plural product heads. The present invention also provides a process for the preparation of pyrrolo2,1-c1,4benzodiazepine-glycoside prodrugs of general formula 1a-b. When it is determined that the route search operation is effective, the navigation system performs A\* algorithm search operations with respect to the start point, processing points and the destination and detects an optimum route to detour the large non-digitized area.

1459828119-ece75df2-d26f-47e1-8af0-7a25a050d7e3

An automated security and reorder system for items maintained within a boundary. The system allows a user to swap or add peripheral devices while the system is running, or in a \u201choth\u201d condition, with little or no user knowledge of how the system carries out the \u201choth swap\u201d or \u201choth add\u201d functions. %, respectively, is used as an active substance for an electrode, particularly a negative electrode, of a non-aqueous solvent secondary cell.

1459828120-4244fc19-9ed3-4029-8fd2-22535ad311e3

Network activity in a network is regulated. The cell analysis and sorting apparatus contains individually addressable cell locations. The computed arrival times, required arrival times, and timing slacks can be projected to a corner value of deterministic variations in order to obtain a statistical model of the delays and slews at the corresponding corner. The junction is formed by coupling the granular superconducting substance of the exposed area of the at least one superconducting segment of the one winding to the granular superconducting substance of the exposed area of the at least one superconducting segment of the other winding. Another level of thin-film super-lattice integration can achieve temperatures of 30 K. The device includes a substrate, a first contact layer formed on the substrate, an active layer formed on the first contact layer, a barrier layer formed on the active layer and a second contact layer formed on the barrier layer, wherein the active layer includes multiple quantum dot layers.

1459828120-8c3daff2-da57-415a-ba2e-962348165f8e

The baffle box comforter includes upper and lower fabric sections and a plurality of longitudinal baffle members which extend for the length of the comforter. The method of automatic configuration includes receiving a user input that specifies availability requirements and information of the software application, where the availability requirements include at least a checkpoint service that enables the software application to save and retrieve its state. This can be accomplished such as by the master system updating a programmable interface of the slave system to identify an image from which to boot, such as from a remote boot image stored external to the slave system. The second terminal is provided on the insulating main body, and electrically connected to a second electronic device.

1459828120-c119a51c-ffea-4e06-9233-c3f0da8d3359

It was found that the domain in which the disinclination was unstable was a domain located on the periphery of the pixel and in which the alignment orientation of the liquid crystal molecules within the pixel was different from the tilting orientation of the liquid crystal molecules due to the transverse electric field of the outer edge of the pixel and it is larger than 90\xb0. A method for preventing or treating hepatitis C in a subject in need thereof is also provided by administering the subject the pharmaceutical composition given above. The hanging base is provided with at least one engaging recess which includes an inserting portion and a sliding portion, wherein the inserting portion has an elastically positioning piece and a positioning projection while the sliding portion has a slide track, a sliding opening, and a positioning frame. The resilient member is disposed outside of the ink channel in at least the open position. The second member supports or is integral with a component that is to be attached to the shoe. The first and third electrodes are connected to a current test probe so that a test current flows through the first electrode, the subject via hole, the test via-hole and then the third electrode.

1459828121-7d1aadbe-e162-48ef-80ce-2d0c3ae67c31

Paraffin compositions including mainly even carbon number paraffins, and a method for manufacturing the same, is disclosed herein. The stimulation is delivered to one or more stimulation sites remote from the ischemic region to elicit a physiological effect that protects the ischemic region from the tissue damage caused by ischemia. The coating agent, having a pH value of less than 6, contains a salt of sulfondicarboxylic diester, a water-insoluble oxide of metal or semi-metal and an acidwater mixture. The metals are reduced and can be recovered by separation from the gangue.

1459828121-7fc08a55-addd-4e5b-b43d-61851822c96d

Exemplary system, and computer program product embodiments for changing ownership of cartridges, such as virtual cartridges between remotely located virtual tape libraries, are provided. A gap between the resistive trace and the conductive trace is provided, and the conductive trace is either magneticferromagnetic or is provided with a magneticferromagnetic material. Therefore, the plate structure having a chip embedded therein can be processed by a simple method to achieve the tenacity of aluminum and the rigidity of aluminum oxide. The device may store a flag in each node that matches a step of the Xpath expression. , the reference value and a value corresponding to the output power of the laser diode, an APC operation is performed.

1459828121-99b1879f-4223-4627-be34-238b8bae3cfa

A system and method for managing information between a diagnostic tool and a networked computing device are provided. A first and a second data access path is configured passing through the SVSs to form the SVS architecture such that when one path is failed, the other can be taken as a substitution. The electrical connection structure includes the driving circuit board, the wiring structure, and a piezoelectric element arranged from top to bottom. Its novelty consists of the following combination of desirable features:. The finished water transport plate exhibits optimal physical characteristics for bubble pressure, water permeability, median pore size, porosity, thru-plane resistivity and compressive yield strength. As the hinge pin moves according to the shape and size of the beverage container, the beverage container can be strongly supported such that the beverage can not be spilt from the beverage container regardless of a shape and size thereof when the beverage container is inserted.

1459828122-0f37321e-79be-4f43-98ee-c495863b7788

The present invention concerns the field of therapy of muscle, joint and/or skeletal diseases. The system also includes one or more discrete tasking modules dynamically tasking one or more of the surveillance resources identified in the core module without modification to the core module. Thereby, when converting RGB image data into CMYKLcLm image data, a color converter, which almost simultaneously color-converts RGB into CMYK, executes RGB to LcLm color conversion and then executes RGB to CMYK color conversion. The island connection electrode is stacked onto an island auxiliary capacitance electrode via the gate insulating film in-between so as to form an island storage capacitance. To accomplish the object, a bracket is provided, which has a U-shaped protective strap in the area of the cylinder valves and has a mount for a balance weight, which can be pushed in between the pressurized gas cylinders.

1459828122-68ead00e-1e68-443d-95b4-b6e063c15e2b

Sulfuric acid electrolysis process wherein;a temperature of electrolyte containing sulfuric acid to be supplied to an anode compartment and a cathode compartment is controlled to 30 degree Celsius or more;a flow rate F1 of the electrolyte containing sulfuric acid to be supplied to said anode compartment is controlled to 1. Further, a sealing of elastic material is provided in order to seal an instrument inserted into the trocar sleeve gas-tight into the proximal direction.

Accordingly, a potential fire resulting from the wrong operation is prevented. The invention includes a method of producing an actinium-225bismuth-213 product from a material containing thorium-229 and thorium-232. Based on an evaluation of the rules, the central server generates outputs in the form of communication to one or more authorized users via a variety of communication mediums and devices and/or the instigation of a variety of acts corresponding to the evaluation of the rules. In PLL mode, a clock signal based on the feedback signal is provided to the delay line, and the delayed feedback signal is output from the circuit.

1459828122-c690b360-7bec-4aad-9cd2-553087265622

Authentication of an electronic communication apparatus capable of communicating data messages with a server according to a synchronization protocol includes providing an authentication method indicator that specifies an authentication method according to which the authentication is to be executed. The metering rod extends through the interior of the medicament container. A seal mounted on the door sealingly engages with an upright wall on the control panel when the door is closed to prevent migration of moisture toward the components of the control panel.

1459828122-f50bd063-fcea-4777-9347-7bd682035b77

A high-pressure mercury lamp is provided that includes a transparent envelope made of quartz glass, in which mercury, halogen, and a rare gas are sealed and a pair of electrodes provided in the transparent envelope. As the device traverses a navigated route according to a first mode of transportation, the method displays a first turn-by-turn navigation presentation defined for the first mode. This single-chip structure associating both gyroscopes and accelerometers makes it possible to achieve detections and measurements in up to 6 axes, in other words 3 accelerometer axes and 3 gyroscope axes, and to exert control by a single and unique electronic unit, thus permitting a single automatic control loop in excitation and a single electronic reading chip.

1459828123-5cb77526-6d80-40ea-a878-584d9ed71a38

Protective helmet device includes a helmet with a hard outer shell and a soft inner lining. The size of the first block which constitutes the data unit handled in the execution of the input/output processing of the data in accordance with the write command by the disk controller is different from the size of the second block which constitutes the data unit handled in the execution of the input/output processing of data by the plurality of disk devices. The generated cut pieces are deposited in a predetermined order in the interim buffer and as called for are processed further. The data protection component allows applications that use the commands of the command set, such as the backup application, to access the storage of the system. Also provided is a system for performing multiple solvent extractions utilizing several microfluidic chips or unit operations connected in series. More specifically, embodiments collect temperature readings from temperature sensors within an enclosure of the system; identify and upward temperature gradient or temperature that exceeds a threshold temperature; and select a failure scenario associated with a root cause of a thermal problem that is similar to the thermal problem described by the temperature readings collected.

1459828123-dd187864-dae5-461b-8dbb-0db68a3e08b6

The present invention includes methods of influencing the sex chromosome ovulated by a female bird and altering the sex ratio in avian offspring by altering the exposure of an ovulating female bird to one or more stress hormones. Either of the control signal pin or the neighbor NC pin, which are electrically interconnected, is electrically connected to the corresponding pin of the next package. An overall noise level in the cluster is calculated using the noise level determined for each compute node, and workload is distributed among the plurality of compute nodes to reduce the calculated overall noise level in the cluster. an assembly comprising the separator plate and the laminar body, and heat-treating the assembly to convert the glass powder to a glass-ceramic.

1459828123-e205a256-4862-4d3d-a36a-7f6adb83326e

A lightweight spoiler wing design for depopulated disk drives reduces unnecessary weight from the spoiler while maintaining the aerodynamic function and structural rigidity required. The lamp bulb has two electrode pins with a predetermined distance therebetween and being connected in the glass body thereof to a light emitting tungsten filament, parts of the electrode pins are extended out of the bottom of the glass body for connecting to a conductor pair. A trigger database stores the web site. The temporary block is a physical block to store data that are smaller in size than those of the page. In one embodiment, the invention includes detecting a temperature of a semiconductor device at a thermal sensor on the semiconductor device, comparing the detected temperature to a threshold, and generating a high interrupt if the temperature is above the threshold and a low interrupt if the temperature is below the threshold. In particular, the present invention provides a jacking mechanism that telescopes from a locked, elevated position to a locked, lowered position in order to situate the jacking mechanism for raising a load.

1459828124-9421a0e9-7230-48d3-a5fc-d035869509e8

A renal failure therapy system includes a blood circuit with a blood pump and a drug delivery pump. The concepts of ranking join indices presented herein are also applicable in the case of a single relation. To create a simple, versatile and specific method for enriching or isolating cellular subpopulations from a complex mixture, the invention proposes the use of nanopatterned surfaces for isolating and enriching cellular subpopulations from a complex mixture. The pressure sensitive adhesive layer has an inner surface adhered to the bottom surface of the thermal dissipation member, and an outer surface bondable to a heat transfer surface of the source for attaching the dissipator to the source in a heat transfer relationship therewith.

1459828124-d63f8f85-c6ad-4e55-9ad7-c5d7c26c7d7b

Disclosed is a photocatalytic filter which can fully secure a space of gaps to constitute a flow path for flowing a fluid to be disposed of and which has gaps structured for easily trapping an organic substance in the fluid when the fluid is brought into contact with a photocatalyst layer. The beard trimmer is comprised of two main mechanisms, a beard trimmer and a vacuum powered suction unit. Once issued, the instruction may be enqueued within a recirculation queue if completion of the instruction is blocked by a detected blocking condition.

1459828124-fb26a854-3f90-49cb-871d-946a1ac35aa4

There are disclosed a method for producing a composite material composed of a dispersing agent and a matrix, and a composite material produced by the method. Directed primarily at elderly family members and the like that live on their own, such a device includes a video screen for display of various media in order to provide memory inducements, as well as video communication on demand. Next, organic resin including photosensitive acrylic resin is applied and an opening is formed by partially exposing the organic resin film to light. Behavior of multiple harmonics can be examined in real time and further information obtained regarding physical properties of the concrete.

1459828124-fe98f1e9-913f-47c1-bb22-142ba22aa8f4

There is provided a touch screen apparatus capable of detecting the presence a touch action and a position in a touch region depending on a change in electrical energy of one node of a touch sensor. The fee collection station may include a controller and a fee receiver in communication with the controller for receiving a predetermined fee from a plurality of users. The first gaseous hydrocarbonaceous stream containing diesel boiling range hydrocarbons is introduced into a desulfurization zone and subsequently partially condensed to produce a hydrogen-rich gaseous stream and a second liquid hydrocarbonaceous stream containing diesel

boiling range hydrocarbons. Upon inflation of the expandable portion, the overall diameter increases, the wall thickness decreases and, consequently, the voids are stretched to cause the drug to be expelled from the voids and into the bodily lumen or tissue adjacent to the medical device. The slope factor may be calculated to preserve top end gray scale range of the display by adjusting luminous output so that input data level maps to separate output grey levels between a truncated and an untruncated level.

1459828126-11aa50fb-03dc-40fc-a69a-f3433890c0ef

A screw tip is provided in front of a screw with a shaft interposed therebetween, and a check ring is fitted around the shaft. The method includes providing a first form of a license to a first computing device via a licensing service and providing a second form of the license to a second computing device via the licensing service. The anchor member is coupled at several portions to the inner surface. The retainer includes an elongate flange with an interlocking surface selectively interlocking with any one of the engagement surfaces on the frame. The support structure has a plurality of biasing structures. 7 cm<sup>2</sup>, with the proviso that a maximum of 50% of the total area of the floor covering is taken up by the area of the second particles.

1459828126-ba98ad8e-e969-48b9-abd6-ce10c431914a

Hydrogen-producing fuel processing systems, hydrogen purification membranes, hydrogen purification devices, fuel processing and fuel cell systems that include hydrogen purification devices, and methods for operating the same. The main valve disk is positioned within the valve body and opens in response to fluid flow between a main inlet and a main outlet. A guaranteed response time over the bus system is determined on one hand by the cycle time of the higher-level unit and on the other by the signal cycle time over the bus system itself. The handbag has a purse insert with sides defining an inner volume of the purse insert. In another embodiment, the barrel device may contain a foam type material to house and center the ammunition.

1459828126-f8f5e91f-a60f-42eb-92d6-a9725dc2b58e

A quick connector is configured as such that one axial end of an engagement window is co-planar with an annular end surface inside of a retainer holding portion. The plurality of frames are categorized into a reference frame and a prediction frame. The power supply further has a control component that is suitable for running an operating program. Selection circuitry may be coupled to the storage units to select the respective data value from the data stream for storage in the corresponding storage unit. System settings are controlled by the values to provide the required operating environment and the values may be captured within the system for subsequent operations and initialization sequences.

1459828127-6fa9a406-bdbc-499a-868b-6636e2dbfe55

A thermal compensation apparatus is disclosed including an elongated element extending from a proximal end to a distal end. A serving eNB receives interference power information of an uplink signal and interference increased/decrease information of the UL signal from at least one adjacent eNB. At the client, a color transform is applied to the color image data which takes into account the user's desired VOI settings.

1459828128-18c97039-c5aa-402f-ad01-14d5be54dff7

A first excitation AC signal ) is supplied to a first excitation coil of a first resolver via a first excitation line, and a second excitation AC signal ) is supplied to a second excitation coil of a second resolver via a second excitation line. The jaws when retracted are intended to be inserted into the pipe end. The liposomes, being similar in composition to microbial membranes or cells, are readily incorporated into the existing biofilm. The display photograph depicts an edited version of the original photograph such that the visible portions of skin

depicted in the display photograph is configured to imitate a general appearance of a mannequin. After the fixing base, the filter box and the air-suction motor are secured to a wall, the hood assembled in suspension can be moved to be positioned above a cooking vessel or directly covered on the cooking vessel, thereby efficiently exhausting fumes outdoors to keep the inside clean such that users can be relieved from the fumes to keep good health, very convenient in use. Further, a pull back handle is attached with the dual slide unit to allow a user to draw the plunger from the air cylinder.

1459828128-299318ec-2dbb-44c5-880a-9285927ff963

A method of forming and preserving a bioremodelable, biopolymer scaffold material is carried out by subjecting animal tissue, particularly fetal or neo-natal tissue, to chemical and mechanical processing. The handling assembly includes a pair of first handling subassemblies and a pair of first handling subassemblies. If the assessment finds a vulnerability, the log-in process can inform the user that the machine is or may be compromised, or repair the vulnerability, prior to completion of the log-in operation.

1459828128-c1b797fc-dcc8-41d5-a4e3-dac099bc156b

A method and apparatus for frequency shift-keying demodulation includes processing that begins by generating a charge signal, a data acquisition signal, and a reset signal from an I component and a Q component of an FSK modulated signal. The apparatus may include a substrate supporting a liquid composition including the substance and a solvent, and a removable micro-mold placed over the substrate and the liquid composition. In another algorithm, all constellation points are searched for every antenna except one. This invention allows segments to be identified as having a predefined maximum number of device addresses that will be associated with it. The movements of the valve elements of the bypass and throttle valves may be substantially sequential. Additionally, when a log of arrhythmias is displayed, for each arrhythmia there is an indication of whether a myocardial ischemic episode was detected within the specified temporal proximity of the arrhythmia.

1459828129-f3b86199-e28a-4be2-b777-3c94c02cca77

A semiconductor memory device is provided with a memory cell array including memory cells being arranged in a shape of matrix and requiring a refresh operation. Each nozzle arrangement includes nozzle chamber walls and a roof that define a nozzle chamber with the roof defining an ink ejection port in fluid communication with the nozzle chamber. The gamma-prime nickel-base superalloy contains, by weight, 18. If a given physical sensor detects a parameter that is not within a pre-determined operating range, the system receives an interrupt from the given physical sensor.

1459828129-fa90c635-1941-44e9-b9a3-c9c84e8786e2

Heteroaromatic compounds are described, methods for their preparation, pharmaceutical compositions containing them, methods of use, and their use in medicines. The turning part turns the turning arm about a turning axis with respect to the head. The vehicle is adapted to carry weapons systems for military application. Inflation pressure of said sidewall provides an adjustment of the resilience thereby adjusting instability of the platform in the horizontal and vertical directions.

1459828130-4d89354a-7b08-470d-a1a8-4f487b2da513

Methods and apparatus for power control in a communications device are described. The systems include at least one sizing module adapted to size components of a themed UI element. The method comprises moving at least a first valve away from a neutral position of the first valve before the engine is rotated by said starting apparatus; and moving at least a second valve away from a neutral position of the second valve after the engine is rotated by said starting apparatus. The resulting model can have impedances that are equivalent to that of the particular fuel cell, thereby capturing or providing a good approximation of the transient behavior of

the particular fuel cell. The primary cell is used to as an energy source for recharging the secondary cell.

1459828130-5cdebeda-8d15-48b3-aae1-1323413b7cd0

A three-dimensional memory array includes a plurality of rail-stacks on each of several levels forming alternating levels of X-lines and Y-lines for the array. The aerial delivery system is self contained and reusable. The invention also relates to devices and apparatuses adapted to implement the encoding method. A status monitoring unit 1335 monitors status, a change detection unit 1135 detects a status change and notifies the editing instruction unit 1134, and the editing instruction unit 1134 receives this notification and instructs editing processing with respect to management items relating to the management targets 1331. A start point in time of every cycle is determined according to the compared result signal.

1459828130-710bd135-a796-423d-9ff2-632135031014

A tank for containing compressed air for supplying the air to one or more pneumatically-operated components, devices, or systems of a heavy-duty vehicle such as a tractor-trailer or straight truck, also serves as part of the structure of the frame or subframe of the vehicle. The end fitting is comprised of a main body and a cover, and defines a cavity, a bottom wall of which is defined in part by the cover. A plurality of edge tool clamps can be mounted to a unified honing guide base system. A high-accuracy location function may then be triggered in order to determine the geographic location of the mobile device. During the read-out or storage of the state, at least one further ferroelectric transistor in the memory matrix is driven in such a way that it is operated in its depletion region. In a closed position of the member, flow from the inlet moves the member to the open position thereby allowing flow through the flow path.

1459828130-afaf482f-d970-4b16-8dd3-c4ba6a396705

A method for removing a shadow from an aerial or satellite photograph, includes collecting aerial or satellite photographs, by the photographing information collecting unit; extracting buildings at each of the collected aerial or satellite photographs, by the building information extracting unit; and estimating a shadow area cast by the extracted buildings, by the shadow area estimating unit. In a preferred embodiment, the size of primary game information such as the images of playing cards or the like may be changed relative to secondary game information such as pay table, credit, and other information. The first lens unit consists of, in order from the object side, a first lens component with a positive refracting power, a second lens component with a negative refracting power, and a third lens component with a positive refracting power.

1459828130-e41b7fb9-7487-402f-9233-6765ce821692

There is provided an internal intermediate pressure multistage compression type rotary compressor capable of reducing a height dimension while reducing the amount of oil to be discharged outside. The first converted audio signal is generated based on the sum of the left input audio signal and the right input audio signal. The bushing also includes an annular inner surface disposed between the first end and the second end defining an internal cavity shaped to receive a track pin.

1459828131-277c1f31-b3a1-4f69-a563-e7f9d12b91c6

An apparatus comprises a child restraint and a bag coupled to the child restraint. Methods include establishing a legal trust that holds assets and issues obligations that grant participation rights in its assets. Also provided are a method of polishing a target member and a process for producing a semiconductor device which make use of this abrasive. 6% by weight of said colorant; an erasable aqueous ink composition containing at least one colorant, characterized in that the colorant has a mean particle size of not more than 7  $\mu$ m and that particles having a size of not less than 7  $\mu$ m account for not more than 0. The line of action has an offset distance that is the minimum distance between the line of action and the pivot.

1459828131-621f7787-dbcc-4616-a615-236b94dd04fb

An interactive robotic apparatus that interacts with a user, especially an elderly individual to provide companionship and comfort. Each of the planetary gear sets includes first, second and third members. The cooling module, which includes strategically situated integral coolant passages within several of its panels, is adapted to protect all enclosed electronic components, including electronic pressure sensors, an EGR valve, and all associated wiring and wiring harnesses. Upon energization of the first stator coil, a first magnetic field is established to urge at least a first one of the magnets and the rotor in a direction of the first degree of freedom and upon energization of the second stator coil, a second magnetic field is established to urge at least a second one of the magnets and the rotor in a direction of the second degree of freedom. One or more sources of carrier gas are configured to deliver carrier gas through at least one of the inlets. The composition comprises at least a lipolytic substance, a thermogenic substance, a substance to inhibit the reformation of triglycerides in the bodily tissues of an individual and an antioxidant.

1459828131-85a780d5-182a-4918-84fc-91bb9ed4796e

A flow-through microcentrifuge comprising a container in which a sample is placed, and a power source capable of rotating the container around an axis. The base is secured to the housing to limit a lateral movement of the base. A substrate of a relatively thicker layer of a third material is grown, by epitaph on the nucleation layer, to form a second assembly with the substrate attaining a sufficient thickness to be free-standing. The spacer film is an LPCVD silicon nitride in one embodiment. The drying equipment removes a moisture portion from the diverted wood pieces.

1459828132-9a3341ca-2c03-47ff-a698-04796ad90f4c

Computer-accessible medium and apparatus for providing subscription-based shipping of items. The access device stores access patterns that associate a subscriber with a call server and define trigger events. Each blade is attached to the milling cylinder in such a way that any one of the four directions of the blade can be selected by rotating the blade around the central axis of the columnar body. Such detection is used to electronically initiate capture of electrical responses from a plurality of electrodes placed on the patient's skin in proximity to the particular area. The invention also allows the player to gain mobility, as heshe does not have to deal with paintball pods flopping around during running, diving, crouching, jumping and crawling activities.

1459828132-c26496ae-b565-4552-8d67-7fa885d05cf1

A suction brush of a vacuum cleaner for both vacuum cleaning and steam cleaning is provided. The retaining wall block includes top, bottom, front, back, first side and second side surfaces. When the mixture is ignited by the ignition electrode 7a, there is a flow of the air-fuel mixture around the ignition electrode 7a inducted by the squish guide groove 15 so as to move toward the center of the combustion chamber, so that the flame propagation rate within the combustion chamber may be enhanced as the ignition is effected on such moving air-fuel mixture.

1459828132-feef0762-bf84-45a9-bbcd-f5fcd899ba2f

A chemical application line is provided having a core chemical application carrier to dispense a desired chemical into a target environment over a period of time. Each substitute currency medium has at least one barcode. During fault conditions, a light sensor senses the ambient lighting conditions and the microprocessor reduces current supplied to the LEDs under reduced lighting levels, such as night, further conserving battery life. Also provided is a device made by this process, an active agent-plastic administration device such as a syringe containing an active agent in the form of lyophilized cake, and an array of such administration devices. A polysilicon layer is deposited on the dielectric layer and further

defines a plurality of parallel, separate bit lines. The apparatus real-time records a source address and input port information of GbE Ethernet frames in a memory, compares a destination address of the Ethernet frame which is a payload of a GFP frame with memory table information, searches an output port location of the GbE, and interreceives GbE frames and Generic Frame Procedure frames by multiplexing/demultiplexing.

1459828133-07722646-c9e6-4b49-9df8-404716edb7f4

A two-piece extendable L-plate provides clearance between a camera and a quick-release receiver securing the camera to a support permitting a camera having cables connected to the side of the camera's body to be secured in either a landscape or a portrait orientation. The antenna control parameter sets include, for each of the transmission channels, a channel value or a channel value combination with which a relative amplitude and a relative phase of a radio-frequency signal emitted via the appertaining transmission channel are defined. The amplifier controls a current source which outputs an output current. Thereby, the delay locked operation can be always conducted accurately. First and second covers are pivotably disposed on the base member. The plurality of terminals includes a sense terminal.

1459828133-88488c71-c346-4a88-ba8c-981bc5b352e3

Circuits and methods for aligning two or more signals including a first and second signal. A processor 5 is responsive to signal 3 for selectively defining a second signal, in the form of an inaudible ultrasonic transmission 6. A reflecting member for reflecting a subject image captured from the lens unit to a finder provided in the main body is mounted at a backside of the focusing screen in the rotating member. The interface board includes an expander coupled to the cables and an external connector coupled to the expander.

1459828133-a2ba9c47-14db-44c3-a479-733c5532e850

The present disclosure relates to an LED-based lighting component that can control the color rendering capability of its generated light based on the presence or characteristics of ambient light. The memory stores templates that provide access protocol information about the external devices. The switched capacitor amplifier section has a signal charge storage section, an amplification transistor whose an input side is connected to the signal charge storage section, a capacitor connected between input and output sides of the amplification transistor and a reset transistor. The IO configuration mechanism further monitors the IO performance of the executing job to then dynamically adjusts the IO node distribution based on the IO performance of the executing job. The photonic crystal structure has at least one reflection minimization layer disposed at an airphotonic crystal interface.

1459828133-fd8526b0-be09-4951-9dc9-d7b28948151f

A verification device of an effective visual field range of a display takes into account a use environment. Each respective data handler is coupled to a respective set of data ports of the plurality of data ports and to a respective set of memory devices of the plurality of memory devices. The script is searched for a given character string, and the given character string is replaced with its associated substitute characters or character strings.

1459828134-4af4f0ee-459a-4dc7-8d05-864d2dfcbcca

Various systems and methods are described for controlling an engine with a turbocharger in a vehicle. To achieve this object, a pickup image storing side multi-stores, in a memory removable from an apparatus or system together with an image picked up by an image pickup device having a plurality of color filters, a plurality of control values used for white balance control of the pickup image. The reset pin is operatively coupled to the valve disc and shiftable along the slam-shut axis relative to the valve body between an untripped position placing the valve disc in the open position and a tripped position placing the valve disc in the closed position. When the decorative floor tile is installed over an underlying

surface, and pressure is applied to the decorative floor tile, a vacuum is created within the blind passageway and the underlying surface. The inner portion of the sliding member locates an end of the damping device that can be pushed inwardly to provide damping. Each piezoelectric element unit has plural piezoelectric elements divided by a plurality of slits formed in the piezoelectric element member.

1459828134-54695d06-4ebc-4b8f-9bbf-a15f883df45a

A floating fountain apparatus includes a buoyant annular float having a central opening. The light guiding object includes a cylindrical body, a reflective layer, a transparent resin layer and a light-adjustable film. With its lateral leaves extended, the irradiation head has a plane configuration formed by the middle section and the extended lateral leaves. Power input to the SSPC of the second type may be connected to a unidirectional SSSD of the SSPC of the second type.

1459828134-5b390d3c-2a62-4b2f-9990-db22a06b17e5

A user interface is described that informs the user as to the status of the operation of a voice recognition application. The GUI type model provides a reference set of GUI element types. The converter circuit includes a first switching circuit and a second switching circuit both coupled with an output circuit.

1459828135-06bb9327-ea51-494e-8619-01a41f02d0fe

A new and distinct cultivar of Limonium plant named 'Esm Amazona', characterized by its erect, long and strong flowering stems; vigorous growth habit; freely flowering habit; small light pink-colored flowers with red purple-colored venation; and good postproduction longevity. One or more readers are disposed within a locale being monitored and are structured to communicate received data transmission from a host controller, for additional administrative processing in terms of determining the existence, location and/or movement of various articles with which the plurality of tags are directly associated. Especially preferred binding molecules according to the invention are short polypeptide sequences, characterized by a stable loop structure. The bridge also determines whether to refrain from transmitting an audio signal to the cell phone, when the bridge infers that the cell phone is being used as a satellite microphone, such as when the cell phone is placed on a conference room table. In this formula, each of the A1 and A2 is a group including at least one of a primary amino group, a secondary amino group, a tertiary amino group, a hydroxyl group, a carbonyl group and a carboxyl group, the A1 and A2 are the same or different, and optionally simultaneously exist, and the B is a group including a fluorene ring.

1459828135-0e1e8566-c0c5-4557-824b-5a39b8766726

A system and method of cleaning and scrubbing contaminants, including sulfides, from an unclean or raw gas includes one or more containers, each of which include a gas permeable receptacle or bag containing an appropriate gas scrubbing medium for removing the contaminants from the gas stream. The second monomer is preferably selected from the group of monomers having carboxylate functionality or sulfonate functionality. Therefore, by allowing different types of DAB receivers to uniformly process video services, it is possible to achieve high efficiency in video service processing and controlling. The inlet channel may connect to the center of the separation channel and an outlet channel may connect to each end of the separation channel. Additionally, grooves are formed parallel to the aforementioned through passage on at least any of the surfaces, upon the edges of which are provided engagement plates protruding into the cross sections of the grooves.

1459828135-13adb493-5609-4c8c-9652-9b487b677ae4

A method for forming a passivated densified nanoparticle thin film on a substrate in a chamber is disclosed. A document to be placed on reserve is faxed to a network server. The metallic foil defines a honeycomb arrangement of longitudinal passageways from an upstream end to a downstream end and also openings for allowing

exhaust to pass between adjacent longitudinal passageways of the metallic foil. Guide portions making an intrusion into a portion between the relatively facing links are protruded from both side surfaces of the sprocket. The joule heating circuits are configured for simultaneous operation with the arcing electrodes, but without detrimental interaction with the arcing electrodes.

1459828136-058763c8-7a54-4b7d-97fb-8cb27b64e160

The notebook computer includes a base and an upper cover. In the manufacturing method, a chip and a porous material are provided. The system includes a scanner configured to read product environment data from the environmental sensor. The contact hole is formed in the intermediate insulating layer. The frequency domain adjustment is then applied to a spatial domain.

1459828136-1a0360d4-b0b7-42c9-be15-67d33af3398e

Method for linking a first and a second communication bus through a wireless link, comprising a first portal connected to the first bus and a second portal connected to the second bus, said first and second portal communicating over a wireless connection. The methods and apparatuses can include an attachment scheme that is less intrusive and less sensitive to dilation of the insulation layer on the pipe than previous strain monitoring solutions. The registered location for positioning the nozzle allows removal and replacement of the nozzle key with the nozzle subsequently positioned in the identical location. Each frame member is configured to accommodate at least one wiring assembly.

1459828136-2229b5b1-55e7-4d94-932f-8f5a9ae270b6

A card reader for a point-of-sale system that is configured to accept both magnetic strip-type and integrated circuit chip-type payment cards. A trace command, which includes one or more specified fields to be traced and a trace output file location, is defined. In various embodiments, SQL PBGF can have a cladding region including 2-10 layers of air-holes. This condition will persist until the strand is damaged by the presence of heat and open flame which is in close proximity. The outer wall is connected with the inner wall via a connecting seam running along an edge region and sealing against escape of the temperature-control fluid, and via a plurality of, especially point, or ring, shaped, inner connection locations, which are arranged spaced from one another in an inner region at least partially enclosed by the edge connection seam.

1459828136-ffdad9c2-1675-4f1a-b18b-759747d204b3

A device for collecting alveolar breath. Examples of molecular complexes include protein-protein complexes and protein-nucleic acid complexes. The patterns to be searched in the input stream are defined by the user as a set of regular expressions. The read-out section includes at least a first horizontal CCD channel disposed beside the two-dimensional pattern, a second horizontal CCD channel and vertical CCD channels interlineated within the pattern of image elements. Nonvolatile memory elements store the test results in a buffer.

1459828136-ffffdfb8f-9475-4057-a0dc-b295dacc02f3

A portion of the disclosure of this patent document contains material to which a claim for copyright is made. The apparatus main body includes an opening in which at least a part of a stroke region of a carriage is exposed. Delineator assemblies using the ground anchor, and methods of installing the ground anchor, are also provided. The invention also relates to the utilization of waste waters within cooling towers and for laundry applications.

1459828137-a5543eba-69da-47e5-bd7e-ec6f913487ef

A scheduling method implemented in an operating system kernel for supporting multimedia applications is provided. The system includes a helmet over which a hood or a toga suspended. The structure so formed completely surrounds an upper conductor and terminates on a horizontal extension of the MTJ sense layer.

1459828137-c78f54a4-f8dd-41bc-819b-27440f5b3214

The present disclosure relates to a new and distinctive hybrid tomato designated \u2018E2134649\u2019, to the plants of hybrid tomato \u2018E2134649\u2019, to the plant parts of hybrid tomato \u2018E2134649\u2019 including the fruit, and to methods for producing a hybrid tomato using \u2018E2134649\u2019 as a parent. According to the present invention, the two guide rails rest essentially without moving play against at least two counterpart support surfaces of the guide support extending essentially in the guide direction, two of the counterpart support surfaces enclosing a predetermined angle, preferably of at most 90\xb0, between them. A map or distribution of T2 parameters is then calculated over the entire region of interest. The model control section calculates Umf and Ums so as to cause a position Pm and a velocity Vm output by an internal model 2Tu seconds later to coincide with the generated position trajectory and velocity trajectory. A suspension mat is attached to the protective cloth below the foam bun to add support. A scheduled object delivery period is computed which is equivalent to the maximum object group delay period allowable.

1459828137-cc237644-b375-44be-9297-ab027a5ddb2

A partial oxide film with well regions formed therebeneath isolates transistor formation regions in an SOI layer from each other. The lifting structure comprising two upwardly extending variably extendible support structures, an arm having a proximal end portion and an intermediate portion, which are pivotally connected to an upper end portion of respective ones of said variably extendible support structures; and a load support structure depending from a distal end portion of the arm. Said antennas emit receiving signals which are sent to an electronic evaluation system which measures the mechanical stresses of the rotating part on the basis of both receiving signals. Legs can be added by force-fit into receptacles molded into the base and a wooden shelf can rest on top of the base to hold the feeding bowls. According to the above configuration, it is possible to decrease a loss of a bridge circuit and common-mode noise, and to provide a power factor improvement circuit in a smaller size.

1459828137-dded4612-b015-4ec9-8b00-e9ed8610e555

A differential receiver having a pair of cross-coupled signal conditioning devices improves transition time and data signal integrity. Conference sessions are established using the persistent virtual private meeting rooms in response to activation acts by the users. The key metal fittings comprise through-holes for lock insertion, and are usually positioned in a space between the main body and the door.

1459828138-8c44c35c-2920-47d6-9c78-bd8306f5ed6a

An optical device includes fluid circulating member link sections that can link a plurality of fluid circulating members. An abutment portion is formed on the mounting member which is brought into abutment with an inner surface of the outer wall of the fuel tank. Accordingly, the sulfur poisoning amount is accurately estimated and by performing the sulfur poisoning regeneration at an appropriate frequency, any excessive sulfur poisoning regeneration can be avoided, thereby preventing deterioration of mileage.

1459828139-594a75af-c07f-4d31-86e0-c638668e151d

Queries regarding access permissions of users and rights to directories in a complex enterprise are executed in near real-time, using lookups to tables that form a condensed database maintained for each file server. A WCDMA node B broadcasts a congestion occurrence information message over a cell area when congestion is sensed. These values can then be used to adjust commanded variables such as start of injection, commanded pulse width, rail pressure to meet operator demand. Indication is made to resubmit the status request if there is a status request for the computational resource pending before the establish operation has

completed. The use of the defined microemulsion enables the addition of perfume as well as other cosmetic attributes to an aqueous base composition under conditions of low shear while avoiding any problems of gelation or physical instability in the finished fabric softener product.

1459828139-9c9411b9-3115-4f2e-b6d6-3f9ae566e785

An electronic converter converts high-voltage AC power main voltage, such as 120V, 240V or 277V, to a low-voltage suitable for driving a halogen lamp. Also provided are peptide conjugates prepared from such synthons, and synthon and conjugate preparation methods including procedures for identifying the optimum probe attachment site. The rotor is arranged inside the stator in an opposing relationship with the cap portion of each of the teeth.

1459828139-abd825ed-ab4c-49ab-9332-c30b0801de36

A nasal cannula support device includes a generally L-shaped strut having a long leg and a short leg. When the computer at the main receptacle is shut down, the auxiliary receptacles are electrically disconnected from the main receptacle to automatically turn off the peripheral apparatus. pickling the surfaces with a solution containing chromate ions; b. Enhanced resolution of absorption spectra is provided when a gas sample contains a large number of components of different gases. The background clips are analyzed and a distance value between the loudness corrected foreground clips and the background clips is defined. The method further includes subtracting the substance contribution from the absorption data, thereby providing corrected absorption data substantially free of a contribution from the substance.

1459828140-3c2bdbd9-795d-4c02-bdd4-1fcf8dfad71a

A particular device includes a transmitter. The modular sunroof frame assembly is attachable to the body structure and includes right and left side rails, front and rear cross beams, and a plurality of corner attachment couplings. The method then detects a request to write a new session to the rewritable optical disc.

1459828140-72e57e00-eba2-4918-9e51-29b70d1cf7f4

A method of operating a sailing boat is provided, comprising detecting a force of a mast of a sailing boat on a mast step of a hull of the sailing boat, while the sailing boat is sailing across a body of water, and providing a reading of the force. Said structural element comprises a winding member which is embodied as a flat component and on which three coil windings are mounted in such a way that the axes of said coil windings point in the three three-dimensional directions. The support mount extends above and below the arm to embrace the seat back.

1459828140-94aaa820-ff9b-4370-81e5-8170209f88a5

A heeling apparatus includes a shoe with a unique feature in the heel that allows one to walk, run, or roll seamlessly. The system includes a patient simulator. A tracking table tracks readunread information on a per-user, per-row level. The brake system is further adapted to transmit a trailer identifier such as an SSID, such that the trailer identifier can be paired with a further device, such as a mobile telephone associated with a tractor driver, the further device having previously been provided with the trailer identifier. The system further includes a floating lamp having a balloon and a lighting element mounted in the balloon. The former is structured with a porous material through which a fluid can pass.

1459828140-f52ce1a3-4c0f-41bc-988a-5e648a5956f3

When a ratio  $R$  between a total angle  $\theta$  of a widening angle in a median intensity of light of a light source and a total angle  $2\theta$  of a widening angle of light defining a numerical aperture  $NA$  of a collimator optical system is defined as  $R = \frac{\theta}{2\theta}$ , the numerical aperture of the collimator optical system is set so that  $2$ . An inducting heating coil has a plurality of bobbins each having a particular diameter and assembled in a telescopic manner. The container transport

assembly advances and positions the containers along a first path towards a loading zone. Back-end circuitry in the synch path generates one or more control signals for controlling the timing of the sampling circuitry based on the front-end output signals.

1459828141-1ba1d89e-bc47-4ce8-a181-f841480cda2a

A laser diode capable of improving surge withstand voltage by preventing damage to a rear end surface, and a method of manufacturing the same are provided. In response to a completion of a memory operation, a determination is made whether or not a refresh backlog count is greater than a first predetermined value. Next, a conductor layer including a lower layer of Cr and an upper layer of aluminum-based material is deposited and patterned to form a data wire include a data line intersecting the gate line, a source electrode, a drain electrode and a data pad. The fluid that does not pass through the membrane is collected in the retentate collection chamber, and can be recovered such as by a reverse spinning step, achieving recoveries greater than about 90%. The coated aluminum alloy powder-pigments are electrically active and prevent corrosion of metals which are more cathodic than the coated aluminum alloy pigments.

1459828141-3db87924-16ea-47ec-a483-a43224f6ad40

The present disclosure generally provides for an integrated circuit structure with a bulk silicon finFET and methods of forming the same. The particles may be utilized in methods for modulating expression of genes in target cells. The technique of the invention can include a moving of a strand of material at a selected speed along an appointed machine-direction.

1459828141-dec386f0-391d-4c5c-b9eb-d48400a803c4

In an inductor integration process, a high Q inductor is achieved by forming an AlCu inductor via prior to depositing the inductor dielectric. The method of annotation for electronic document includes: storing annotation contents for one or more electronic documents into a shared dictionary; and when a reader browses an electronic document, providing the reader with annotations for the electronic document based on the shared dictionary. The effector molecules are attached to the distal ends of the polymer chains. Application of cranking torque to the combustion engine is controlled in operation to substantially temporally coincide with a gear change in the gearbox. The first channel forms a rib of a first impression material being introduced into the interior of the base body and flowing through the bottom opening into the first channel.

1459828141-f6807476-8dfd-4657-9ffb-6661051c80b6

A method for sorting integrated circuit devices of the type having a substantially unique identification code, such as a fuse ID, including automatically reading the ID code of each of the IC devices and sorting the IC devices in accordance with their automatically read ID codes, is disclosed. The article of footwear may also include a cavity having a first portion defined between the upper and the midsole that receives the prosthesis when the prosthesis is inserted into the article of footwear and a second portion having a constant dimension between the upper and the midsole along the length of the second portion. The distributing element is divided into cells, where each cell has a liquid inlet and a liquid outlet perpendicular to the cooled plate, and the distributing element has multiple cells along the plate. Each laser is oriented at an azimuth angle 45 degrees from the orientation of the manhattan geometry on the wafer, and 90 degrees in azimuth from one another.

1459828142-0e72a94a-f235-4e04-a501-9f7b563f92cd

A refrigerant distributor includes a body portion defining a swirl space, a refrigerant inflow port, and first and second refrigerant outflow ports which causes refrigerant in the swirl space to flow out and distributes the refrigerant to components of a refrigeration cycle device. The friction stir welding apparatus includes a spindle housing and a pin tool concentric with an axis and rotatable

relative to the spindle housing about the axis. The bracket includes a top wall and a mounting piece. The sound processing means can feed the first receiver with a first signal of a first central frequency and the second receiver with a second signal of a second central frequency. Each of the one or more failed statements are re-executed according to the predetermined order. If the binary process is non-stationary, then a cardinal number of the set of predicting functions is equal or less than a cardinal number of the behavioral genotype set.

1459828142-be022b2d-a6e7-4603-93b1-9393adf6269b

A method for producing a porous cross-linked polymer sheet capable of slicing quickly is provided. The invention also provides methods for isolating betulin; lupeol; betulinic acid; 9,10-epoxy-18-hydroxyoctadecanoic acid; 9,10,18-trihydroxyoctadecanoic acid; polyphenolic polymers and fatty acids from birch bark. For a Yellow alarm, this means that for the case of D4 superframe format, the second most significant bit of each of the twenty-four bytes of a T1 frame containing at least one fractional DS1 carrying alarm information is set to a \u20180\u2019, irrespective of whether the bytes are valid DS0s or idle bytes.

1459828142-f3ce9eb5-9776-422f-965f-c34911b5cdf7

A highly reliable light-emitting device is provided in which an organic light-emitting device is not degraded by oxygen, moisture, and the like. The optical lens of the present invention is composed of two optical lenses that form a pair. A reliability measure is determined based on the required amount of retraining and a class of the data item is determined based, at least in part, on the reliability measure. A leaf spring and detent is provided to fix the guard in the extended and retracted position, and provide slight resistance during movement between each position. A magnetic field sensor is disposed adjacent and stationary with respect to the element for sensing magnetic flux to produce an output signal which is based on the position of the element.

1459828143-13f89f68-a58b-46ae-8626-653ee278ca71

A dynamically reconfigurable processor is provided having a wiring structure which enables flexible mapping of a program to the processor with a small wiring area. A suction generator and dirt collection vessel are carried on the body. Based on the context of a computer associated with the input device, an illuminated pattern identifies the current functionality of one or more of the inputs of the input device. The electronic control module correlates information transmitted from the wheel unit with antilock brake system data. The rotor phase generation unit is arranged to generate an estimated value of the rotor phase and an estimated value of a rotor speed using the correlation signal.

1459828143-51d64f37-09d0-4e68-a9d3-17953e76ad35

The invention relates to dental materials which contain filler and a polymerizable matrix and are characterized in that they additionally have a component which contracts during thermal treatment. The protective weather garment may include an upper portion, a body portion, and an adjustable bottom portion. For each group of corresponding pixels from the digital input images, an average color value in a first color space is derived by taking a separate average across each color channel of the first color space. The support assembly member may include an actuating lever having a grip portion for facilitating engagement of the actuating lever and a locking portion.

1459828143-e6e07b16-9678-492f-9ceb-8a654666f641

A system and method for previewing a reboot. In the technical solutions, a signal processing method in a microwave transmission apparatus includes: directly multiplexing at least a service signal and a non-service signal, and converting the multiplexed electric signal into a multiplexed optical signal; and sending the multiplexed optical signal to an ODU. The mask and the array of lenslets are disposed such that light from the wavefront that is transmitted by the transmissive

regions is focused by onto the detector array by the array of lenslets. The upward facing parts of the legs perform a boundary defining function in bordering the seating area of the support to constrain the foot of an item resting on it, once in use. In this way, the invention avoids the problems encountered with prior methods, in which synchronization resulted in a recurring record being transformed into a series of individual records.

1459828144-52a14f70-1300-46d6-98b7-41b16a5ad1d1

An IC card system for transceiving data signal between an IC card processor and an IC card in the manner of non-contact are provided. The computer employs a software application that allows the computer to communicate with the resource. To prevent the jamming of objects that have been inadvertently placed below the base door, the novel wall-mounted cooking appliance has a control unit that detects an angle of inclination of the base door and controls the drive device in accordance with the magnitude of the angle of inclination to reduce the latter.

1459828144-6fd42d84-38f5-4bc9-88e2-0c7ae0505375

A mechanism for applying security category labels to multi-tenant applications of a node in a PaaS environment is disclosed. A clamp region is formed between the first and second clamp members. In order to allow the blade to deform more easily so that the filler can take up the strain, the webs are pre-buckled so as to compress at least some of the webs. An output timing-determining device outputs a switch changing-over signal to either one of respective changing-over switches in a changing-over switch circuit.

1459828144-83122629-03ae-456b-8ad8-237a74a778f8

A dispensing system for chewable pet toys contains multiple toys and dispenses them at intervals determined by one or more modes of operation. A linear array of phase shifting elements in the MEMS device creates a linear image which is scanned to form a two dimensional scene. In its locked use position backrest frame can be pivoted relative to seat frame within a comfort range by motor.

1459828144-90ed56b2-9de4-4af5-8d9c-eff6a716abb2

A cleaning assembly 10 having a telescoping handle portion 12 and a sponge member 40 which is pivotally coupled to the telescoping handle portion 12. The fiber optic assemblies include a plurality of optical fibers and a plurality of electrical conductors for transmitting power with a protective sheath covering at least a portion of the same. If the first information is associated with the process control system, second information is generated to indicate that the first information is associated with the process control system.

1459828144-b0c4e71c-84f4-415b-aa9f-1c2ff90169c7

A system and method of asset sealing and tracking includes a first RFID device with a first identity that is permanently affixed to a container door, and removable second RFID device with a second identity is coupled to the first RFID device and inserted through a locking hasp of the container door. The sleeve has an inner diameter which is greater than the maximum diameter of a pot disposed therein. The main chamber is capable of collecting the high pressure air via the air-in passage to actuate the cylinder to move up while the valve bar is pressed, and exhausting the high pressure air via the air-out passage to actuate the cylinder to move down for reposition while the valve bar is released. At intermediate positions between the first and second positions, the flowable material input is divided between the first and second containers. Electrical current routed to the adapter through the light fixture simultaneously illuminates the light bulb screwed into the socket of the light holder and the audio alarm. All this significantly increases the reliability and efficiency of the machine and results in decrease of the related manufacturing and operating cost.

1459828145-0a4fcd98-3b2f-4d72-9ba2-97a43d647723

A two TFT pixel structure liquid crystal display includes a first and a second scan line, a first and a second signal line, and a pixel. The method includes indicating to a number of forwarding engines that a forwarding engine has completed a switchover operation and causing at least one of the forwarding engines to acknowledge that the forwarding engine has completed the switchover operation in response to the indication. The rail structure comprises one or more tracks oriented parallel with external wall sections made of metal, and a partition separating the external wall sections and comprising an intermediate wall made of an electrically conductive material.

1459828145-6ba04b17-3d4a-4bd1-a477-9ead57b72957

A technique for selectively frequency translating optical channels in an optical network is disclosed. The expanded micro-capsules create an aesthetically pleasing surface texture in the coating while retaining the desired wear-resistant properties of the coating. The association table includes a first segment entry associated with a first video segment of a first length and a second segment entry associated with a second video segment of a second length that is longer than the first length.

1459828145-7a452f5e-fded-4443-bbea-a47af91b194b

Methods, processes, apparatus, equipment and systems are disclosed for converting carboxylic acids into esters by esterification with alcohol and a dual catalyst. The car conveys people and things upwards and downwards within a vertical conduit or hoistway supported by a cable extending to an upper pulley. The electroluminescence device is featured by the tapered side surface of a gate electrode of the thin film transistor. The bulk acoustic wave resonator includes electrodes for electrically connecting to electrical supply lines. This provides portability across different RDF stores.

1459828145-88b93d37-b216-44dc-ab26-02e0635d1ae1

A ball retrieval system includes a bag member that has a bottom wall. Perchlorate and other oxidized contaminants are reduced and removed from water with a method using a primary electron acceptor. Then, the incoming call is handled according to an input instruction. The file can be forwarded using the transceiver to a remote terminal, which can access the resource from the network address. If all of input terminals of the voltage output circuits are connected with electronic devices, the positively enabled tristate buffer of the voltage output circuits are enabled.

1459828145-a576ac95-6aa9-47e4-a53d-97a2698a893b

The present invention relates to cast polyurethane elastomers of high resilience, clarity, and attractive abrasion resistance derived from polyurethane systems comprising a customized selection of polycaprolactone polyol incorporated into the isocyanate and/or isocyanate-reactive composition. Such compounds are useful as protein tyrosine kinase inhibitors, more particularly inhibitors of c-fms kinase. The displaceable support element may be automatically engaged or disengaged from the anchoring structure as occupant and/or driving conditions change prior to actual air bag deployment. A statistical mean of the index-associated mean-variance efficient portfolios is used for evaluating a portfolio, in accordance with a specified balancing test, for statistical consistency with a specified risk objective and, additionally, for defining investment-relevant allocation ranges of portfolio weights. The columns of transistors can be grouped into a plurality of sub-arrays and only those sub-arrays having columns that will be read during a given read cycle are precharged during the read cycle.

1459828146-2c8459fc-ab7a-4d69-9797-a06462544487

One aspect relates to managing deliveries of at least one goods, items, and/or services that could be received by at least one customer, at least partially by recognizing an exemplar as corresponding to the at least one goods, items, and/or services. In particular, an inner guard that is located closer to an active area

provides desirable performance during normal operating conditions, while an outer guardring located further from the active area provides desirable performance during an ESD event. The support members can be formed or adjusted to account for the slope of the surface.

1459828146-7d3dcb16-c351-4da1-8311-068b357b3ed6

The invention relates to a method and apparatus for growing a thin film onto a substrate, in which method a substrate placed in a reaction space is subjected to alternately repeated surface reactions of at least two vapor-phase reactants for the purpose of forming a thin film. The content of the amino-acid compound as lubricant in the mixture is set to range between 0. The top coat composition has a proper degree of solubility in a developing solution. A transparent heat sink layer abuts a terminal end portion of the light delivery arrangement and terminates at the ABS.

1459828146-83e67d44-40d8-4150-9b8c-c249f2a66f32

A light amount adjustment member, which causes little deterioration of image quality by diffraction at a grain boundary between ink dots in a colored portion, can be simply produced at low production cost and high yield. The solid polymer electrolyte membrane is produced using polymer electrolyte-containing solution preparation step of dissolving a perfluorocarbonsulfonic acid resin having an ion-exchange capacity of 0. The invention increments a first counter for each of the queues with the quantum value and donates the quantum value to a share counter, when the value of the first counter exceeds the first counter maximum value. The scattering extractor pattern alone may provide greater than 50% of light on the target area, and light extracted by the specular extractor pattern alone may produce an illuminance on a selected portion of the target area that is greater than 5% of the maximum illuminance produced on the target area by the scattering extractor pattern. Each disabled element may be displayed with a visual indicator communicating that it is disabled. It is therefore possible to improve the fuel economy of the vehicle by increasing the frequency of engagement of the lockup clutch without affecting the function of the lockup clutch.

1459828146-9731e7a7-52f0-4e52-9b9b-03841e24e684

An optical fiber delivery system for delivering ultrashort optical pulses that can efficiently transmit high peak power, ultrashort optical pulses from an optical pulse source to a desired position in an optical apparatus is provided. The memory system includes a memory device, and a storage block connected to the memory device. The second pair of opposing insulating side walls comprises respective layers of insulating material formed between respective contact holes. The length of fiber is longer than the coherence length of the pump signal.

1459828146-ab336f98-1ad5-4f35-a2cb-0ea9f56ae54f

An apparatus and method for inducing a person to store telephone numbers or other contact information entered into a new voice message delivery method and system. The structural support system comprises at least two parallel and spaced apart support columns. The image capturing module is used to record an image sequence included N images. This routine may be downloaded without requiring intervention at the computer and may be downloaded only if needed by selection of an application.

1459828147-4a8d126a-ffc7-4242-b8ac-eda764b110aa

A hook element for detachably connecting two objects with one another has a first hook shank, a second hook shank, and a hook bow connecting the first and second hook shanks with one another. One such system utilizes one or more electrodes to measure an additional analyte. The consolidation may be achieved by hot pressing, HIP or any other appropriate method. Base application servlets are provided for each Diameter interface.

1459828148-552ebb54-4a88-490c-b30d-31b8cbcb47d6

It is possible to grasp the behavior of a protein in a cell by realizing a nuclear magnetic resonance imaging method having spatial resolutions on the scale of a cell, and to provide an industrial measure for developing a high-quality protein utilizing this technology. The subject consists of textual and non-textual material, and pixels of the subject are loaded into the printing device. The semi-structured data comprises structured data including structured data fields and tags, and unstructured data. The sample spots are deposited onto a MALDI target substrate using ultrasonic deposition from a nozzle.

1459828148-6e730dcf-76a3-4dbb-a4a6-0fefc50f79ef

A programmable logic device includes a signal distribution network, separate from the high-quality, low-skew clock distribution networks of the PLD, for distributing, from peripheral input/output regions of the PLD, clock-type signals. For example, when a search query is received from the user, a list of hits is generated. In some embodiments, the spike can be retracted when the system is carried in a golf bag. In the preferred embodiments the sensors are equipped with diaphragms of novel shape and employ multiple pairs of fibers, temperature sensitive components and novel compensation and status monitoring circuits.

1459828148-7b8a45ba-5978-47e4-b043-61f361821d00

A radio receiver having a plurality of features programmable by a user, the data relating to the programmable features defining a set-up configuration. For example, the cache may store content in a manner that allows a software process to map virtual memory to specific, known regions of an underlying physical memory. A sum of a depth of the second drift region, a depth of the gate dielectric, and a depth of the gate electrode may be of substantially a same value as a depth of the first drift region.

1459828148-c09316e3-9020-4629-be8b-008a275a0977

In a method of separating carbon dioxide from a gas mixture, a liquid solvent flows down an array of vertical wires with the gas mixture flowing over the liquid. The methods employ a set of thermal elements for locally controlling the temperature of the ribbon. The lens focuses acoustic waves on an acoustic imager which detects the image. The method may include: imparting a purposefully varied pretwist to the wire pair using a wire pair twist modulator; and imparting additional twist to the wire pair using a wire pair twisting device downstream of the wire pair twist modulator. The method also comprises establishing a connection between an access terminal and an access network based on the selected initial protocol set identifier. More particularly, the present invention is concerned with methoxypolyethylene glycol thioester chelate methyl esters that are useful as protectors against tissue damage by penetrating the cell membrane to remove electrons from free radical oxidants and remove heavy metals that may react with peroxides to produce the reactive hydroxyl radical, or remove  $\text{Ca}^{++}$  that may be released from organelles.

1459828148-fb1b0131-d68f-4ed2-95c2-f24d0c8dea06

The light-emitting device has a plurality of light-emitting elements that is mounted on one or more wiring patterns on a substrate. The coated article includes a substrate, a hydrophobic layer formed on the substrate. The locking member has a main portion abutting against a top surface of the cover, a latch portion extending from the main portion and latching with the retention portion of the housing, and a locking portion extending forwardly from the main portion to lock with the complementary connector for providing a mechanical connection therebetween. Unfolding the implement to a field working position disengages the lock joint by extracting the insert element from the retainer element. The method includes determining an operating position relative to the boundaries for the vibration confinement device on the vibrating member to define a determined position.

1459828149-25c6bdc8-e8f1-4966-b97c-5391ae1a58fa

Pluggable fiber optic modules having a receive printed circuit board and a transmit

printed circuit board perpendicular with an interface printed circuit board with an edge connection. The honeycomb is made from a mixture of activated kaolin and a mineral selected from the group consisting of lithium fluorhectorite, lithium hydroxyhectorite and mixtures thereof. The correction can be made automatically or manually by means of control means enabling a user to select the sub-regions to be excluded. Accordingly, a system and method in accordance with the present invention detects when an ultrasound transducer is coupling energy into a patient or into a reflecting medium such as air. The computer processor determines that the individual is in compliance with safety procedures associated with operating the apparatus and generates an enable signal. However, many of these measures are either incompatible with linear charging regimes or add cost to the adapter and/or charging system.

1459828149-2da6a044-828c-455f-81a7-14a710cd70d2

A sound processing system increases the robustness of surround sound in various playback situations. The server allows for communications with one or more terminals via an internet-type communications medium, while the drive is for controlling, monitoring and/or otherwise interacting with at least one motor, electromechanical machine, or other appropriate type of machine/process. The central portion can be constructed as a two-dimensional block in time and frequency that spans a default cell search bandwidth, a predetermined bandwidth specified by synchronization codes or other signals, or another suitable bandwidth. A resistance between the first and second vias is measured, and the extrusion is determined from a relationship with  $R_{total}$ ,  $L_v$ , and resistivities and dimensions of the interconnect and the extrusion monitor structure.

1459828149-fc0edceb-e3f2-4872-9972-ad0b609d6ff2

Electronic circuits or the parts thereof on printed circuit boards are tested by detecting infrared radiation emitted by the surface of the circuit. The apparatus includes an arcuate base portion having a central axis and a buttress extending from the base portion axially relative to the base portion. The base has a piercing post for opening a closure of the bottle.

1459828150-14ea4d74-60e7-479f-be83-e45cf7cd76e0

An ad-hoc, peer-to-peer radio system includes a series of radio terminals forming a service group, each radio terminal having a transceiver for communicating with terminals in the same service group, computer means, and memory for storing program software. In the cooling apparatus, the air conditioner external heat exchanger and the fuel cell cooling heat exchanger are partially offset from each other so that a high-temperature portion of the air conditioner external heat exchanger is not overlapped with the fuel cell cooling heat exchanger in a front view taken from a front side of the vehicle. Each of the write powers, allocated to the respective pulses of the recording pulse pattern, is linearly varied in proportion with a change of one of the recording linear velocity and a recording position of the storage medium. Instead of an arithmetic modulo operation that is implemented in the transmitter, the invention defines a Discrete Modulo Operation that performs the function of limiting the amplitude of the transmitted signal.

1459828150-30fffc124-0fd5-4994-a06f-721a50fd613a

A hospital bed including a frame, head and foot supports, and a deck coupled to the frame. The system will be able to select an appropriate wiring pattern so that signals meet their performance requirements. With this capability, for example, the tuning and biasing of stages within a multi-stage amplifier within a CMOS PA can be measured during factory test and adjusted by setting one or more bits in the OTP memories, as desired. The evacuation system further includes a package carrier including a pinch-off area that moves product out of an unrecoverable portion of the product package. The mold cavity is filled with a molten metal, which solidifies after filling to form a casting. An interface device is responsive to the button control signals and is operative to provide device control signals via a

wired connection to an electronic display device.

1459828150-aae2bc34-cd1c-4afa-9ee6-15b7a50010d7

A user interface provides historical and hierarchical search and navigation modes through previously selected and hierarchically linked multimedia applications, documents and directories. The camera can detect an external signal; determine that the external signal indicates a restriction in recording; and based on the restriction, either disable recording or record an image or a video with a region of the image obfuscated. As an image is being generated, some but not all z-pyramid values are written from the graphics system into memory that can be quickly accessed by the host processor. Gas supplied through a rear end 21 of the cylindrical member 20 is introduced into the chambers 11 through 14 through openings 22, 23 and a front end 24 of the cylindrical member 20. In addition, the thermal coefficient of expansion of the glass fiber epoxy composite material comprising the planar substrate can be closely matched to the TCE of the electrical contact material. On the occasion of a re-seek start in the error recovery process, the HDD conducts a fall check referring to the detection result data.

1459828151-5ffa59f2-bdd0-40d2-83d2-93a4bceed5df

A system, method, and apparatus for facilitating high-speed access to data files stored at a digital cellular switch is provided. The absorbent articles include a plasto-elastic material joined to or disposed on at least one of component of the absorbent article to impart sizing or shaping capabilities to the article. Methods of adjusting the length of a golf club shaft without damaging any portion of the shaft and variable length shaft kits are also disclosed herein. The mobile switching system routes the user communications between the antenna systems and network communication systems. The second winning combination of symbols is displayed and the player is provided with the second award.

1459828151-cd5d5226-3ac4-4837-aa61-2120c371a475

An integrated circuit structure includes a memory. The brief includes a back section having a pair of ears, each having a single fastening tape mounted thereon, and a front section having a pair of ears for releasable securement by the fastening tapes of the front section. The display device is disposed at a side of the frame for zooming information displayed on the screen.

1459828152-0e9fa129-2bda-464d-b2b0-123cb75d65ad

An absorbent composite that can handle complex fluids and maintain high absorbent capacity under high loads even after the material has been subjected to rigorous processing conditions. The outer tube has an upper receiving space and a lower receiving space. In a preferred embodiment, the device of the present invention is a pipette tip having dual channels, one for inlet of sample and one for outlet. Coupled to the base and depending downwardly therefrom is a leg for supporting the base at an angle. The first and third data are hashed with an encryption algorithm defined hash algorithm using said encryption algorithm and based on Merkle's meta-method for hashing.

1459828152-604b9c19-ae95-4465-9628-ce9aff513811

A method of programming a tire pressure monitoring device includes the step of forming a physical interface between a tire pressure monitoring device and a programming device. The second zone is in thermal communication with a first sensor and comprises a reformer, while the third zone is in thermal communication with a second sensor and comprises a fuel cell stack. A signal is generated that is representative of a difference between the desired current flow and an actual current flow through the electrical component. The decoded signal is spatially scaled up through a high-resolution procedure with reference to the input video signal so that the decoded signal has a smaller error with respect to the input video signal, to obtain a high-resolution scaled-up video signal. A mechanism, partially disposed in the cavities, is included for effectively discharging a

volume of fluid through the scrubbing assemblies towards the boat hull. The disclosed electrode structures can be configured for use as analyte sensors.

1459828153-70243f60-b131-44df-8e16-1e8c2fe63f46

An imager in which two adjacent pixels share row and reset lines and a row selection circuitry while the output transistors of the two pixels are configured as a differential amplifier. Spot movement circuitry effects a movement of the spot, from which the radiation is detected, to various positions. The rotor is capable of moving relative to the stator.

1459828154-f8e2e69d-5dbc-49b6-8c82-9ccb3df51aa0

At least one exemplary embodiment is directed to a website configured to collect sound signatures from around the world and beyond. A desired electromagnetic flux skin depth for heating the material within the crucible may be selected, and a frequency of an alternating current for energizing the inductor and for producing the desired skin depth may be selected. In specific embodiments, the invention provides methods for inducing and stabilizing nitrile hydratase activity, amidase activity, and asparaginase I activity. The pulley base is fixed with a pulley rod having its pulley fitted in the rail groove of a sliding rail, enabling the window curtain to be assembled, shrunk or expanded. The storage pocket and its contents are concealed when the backrest is lowered and are accessible when the backrest is inclined.

1459828155-3f2d5fc0-b368-427b-b318-f6f37b9f853c

A vehicle locating system includes a first transmitter within the vehicle, the first transmitter is configured to transmit a location signal; and a key fob including: a receiver, a direction indicator, and wherein the direction indicator is configured to point towards the first transmitter in response to receipt of the location signal by the receiver. The operation of the circuit is simulated using a first set of values for the process parameters for the devices and is also simulated with some of the process parameter values varied. The substance supply container in an operative state in relationship to the base delivers a supply of a substance therein in liquid form to the operating components on the base to be vaporized thereby.

1459828155-59dad740-c05d-488a-b3df-94d6c20dabf3

The invention described herein relates to a filter system for sterilization containers which secures a gas permeable filter onto a vented portion of the container. When a patient wearing the garment assumes an undesirable position, the switches are activated and the indicator produces an audible, visual or other prompt to remind the patient to change position. Such absorber-activator combinations are capable of rapidly reducing the oxygen in a closed package. The electrical connector also includes an impedance-control assembly having a plurality of dielectric bodies supported by the connector body. A connector assembly is coupled to the housing and is coupled by an optical fiber is the sensing element.

1459828155-874b92be-036e-40ab-bc87-bbd54a2829d2

A shawl including a sheet of fabric having an inner surface and an outer surface defined by a top edge, a bottom edge, a right side edge and a left side edge. Several recordations of an image of an object are made sequentially with an electronic camera and, between recordations, the image of the object and the electronic camera are shifted relative to each other. The starting method comprises the steps of first connecting at least one, but less than all, of a plurality of windings to a respective phase-shifted supply voltage at a controlled point in the supply phase. At least that interface region of the floating gate electrode, which is opposite to the substrate, is made of n-type Si or metal-based conductive material. A platen member interposes each belt and is placed between the pairs of rollers.

1459828156-14a4cc24-2390-490a-b8b0-d95539eceeaa7

Some embodiments of the present disclosure relate to a method that achieves a substantially uniform pattern of discrete storage elements comprising a substantially equal size within a memory cell. The present invention imparts a process by which merchants and other service providers can access a verifying agreement indicating a user's intent to submit biometric data as a substitute for a written signature and the user's consent to abide by the terms and conditions of any agreements entered into by the submission of biometric data. Each valve actuator subsystem has a valve actuator and a switch configured to selectively control application of voltage to the valve actuator to thereby selectively control energization of the valve actuator. The second channels are interdigitated with the first channels. Points along the control curve correspond to a value of the electrical parameters and the ablation zone control module triggers a signal when a predetermined threshold value of the electrical parameter is measured corresponding to the radius of the ablation zone.

1459828156-470408f6-4629-4e62-a05d-750f5dacd5de

The invention provides a system that controls the air intake pressure of a venturi mixer in an air/fuel ratio control system for gaseous fueled engines to match the fuel vaporizer/regulator output pressure or to a desired set point of a fuel vaporizer/regulator connected to the fuel inlet of the venturi mixer. The first electrode and the second electrode include ferromagnetic layers. The display interface can be positioned on the mounting interface and adjusted to achieve a desired viewing angle of flat panel display. In order to permit a reliable hot start of the engine with a simultaneously low strain on the components, the leakage line is provided with a valve device which has a shutoff function and a pressure relief function that are connected in parallel with each other. The polymers are orally administered, and are useful for the treatment of hyperphosphatemia. Events are abstracted into a set data-type.

1459828157-809e93ed-229a-47bb-962a-ae0dd3be068e

A container that has a base from which first and second pairs of spaced-apart, opposed sidewalls project to collectively form a storage compartment. The plastic surface is subjected to an etching treatment under mild etching conditions. The developer storage pouch is deformed to discharge the developer by peeling the seal off the shell to permit air to enter the shell through the air passage. The equipment controller converts the data packets into equipment data corresponding to the equipment port, and transmits the equipment data to the equipment port. A releasable connector connects the axial seal to the closure and a retrieval tool attachment releases the axial seal from the closure upon application of a predetermined release force by a retrieval tool. The polyol can be used to produce polyurethanes having improved properties.

1459828157-d4782eaa-65dd-483d-ad48-80723b403bff

A method and system for providing computer-generated output and in particular graphical output. Several different but similar embodiments are disclosed. The perimeter heat seal includes at least an insertion end heat seal, a funnel end heat seal, and a pair of side heat seals which extend along each side of the package from the insertion end heat seal to the funnel end heat seal. The anchoring base is provided with a resilient washer, such that a resilient force can be employed to adjust loading of each graphite electrode pillar in an axial direction. This invention relates to the maize variety X08C942, the seed, the plant produced from the seed, and variants, mutants, and minor modifications of maize variety X08C942.

1459828158-15ec2e03-e7ba-4ff6-bd66-87639351ec92

A hollow golf club head includes a face portion made of metal, a sole portion, a side portion, a crown portion, and a hosel portion. In order that the product shape after discharge is capable of being ball-shaped the receptacle into which the product is discharged is located to provide resisted discharge of product over at

least part of the discharge cycle. Further, the system may be configured to transmit radio frequency signals along a length of the exhaust conduit. In the scheme, estimate-related specifications of the job quote file are entered into a comparison engine. When the semi-maximization instruction receiving part receives the instructions for semi-maximizing the window, the controller allows the window to be enlarged and displayed in the entire area of the display region determined by the display region determination part from the plurality of display regions.

1459828158-3c082c40-11c2-42b4-9389-209d1123332b

Compact haptic interface includes a base and a yoke rotatably disposed within the base. Also disclosed is a method for quenching a heated metal part, which process comprises immersing said metal part in the quenching medium. The vessel also has two one-part shield segments, each affixed to at least to one of two stiffening rings. The transfer line is constructed so that gases produced during the burning of the RDC do not escape and pose a threat to the surroundings during functioning and so moisture does not enter the system during shelflife, transportation, or at any other time prior to functioning.

1459828158-3ff38c93-759e-45de-87c5-4d5d1d68a6aa

A method for processing a financial transaction such as an electronic bill payment is provided. The lubrication oil way of the engine includes a crankshaft chamber B, a camshaft chamber C, an upper rocker arm chamber D and a condensation chamber E. Such measurements can identify variations in material properties between different regions in a single semiconductor wafer of the type used in fabrication of integrated circuit dice, or even between multiple such wafers.

1459828158-468fa6d7-2346-451d-892f-cabc08873151

Two spaced bodily tissues are approximated with a surgical tensioning device comprising a resilient member and a pressure locking device. The passive filter and the electrostatic discharge protection circuit are formed on a substrate. As a phase transition through the beginning of a phase cycle is detected from the first phase accumulator, a first phase offset word and a second phase offset word for the first and second phase accumulators are calculated and loaded into the first and second DDS circuits. The test circuit further includes a first switch for switching ON/OFF a power supply to the MOSFET device to and a second switch connected between a drain and source terminal of the MOSFET.

1459828158-d7d38977-2459-4d0c-95e4-7f695584e5f2

A layout determination method is provided in which, if arrangement information of areas laid out on a predetermined page satisfies a condition set for the predetermined page, a distance between objects arranged on a page different from the predetermined page is changed and a relay layout process is carried out. Structure at the ends of the live slip engage within corresponding grooves of the slip recess. Then, transmit weights to be applied to transmission signals are determined in accordance with the feedback signal.

1459828159-446840b1-f81a-4c94-8590-759f21ac4400

Disclosed is an ultra slimmed LCD capable of being applied to a hand-held terminal such as a cellular phone. First ) and second ) current paths are arranged on the first and second planar sections. In such a simple structure, the linearly polarized wave and the circularly polarized wave are all received to be processed. Mapping may be static and determined at processor design, programmable, with data stored and amendable, or conditional and dynamic, the interrupt logic executing an algorithm sensitive to variables to determine the mapping. These methods may also be combined in any way. The core layer is more rigid than the top and bottom layers.

1459828159-5ca4fd5b-17d3-4852-9cca-04db708d24e1

Embodiments of golf clubs with grooves and methods of manufacturing thereof are

described herein. This leakage detection protective circuit includes a rectification circuit, a current-limiting resistance, a controlled silicon rectifier, a power supply main circuit switch linked with a reset button and a tripping coil with a built-in iron core. A material extension of the package cover 450 is simultaneously folded under the package base to supply force maintenance for permanent hermeticity. Among the pacing parameters which may be selected in this way are the atrio-ventricular delay interval used in atrial-tracking and AV sequential pacing modes and the biventricular offset interval.

1459828159-653c0f9f-5fe0-412a-ba5c-63bed8a94c65

An FPGA is described using optical waveguides for routing signals through the FPGA. The refining of the vitrifiable materials after melting comprises at least one step of subjecting them to subatmospheric pressure while centrifuging. The movable portion is configured to rotate relative to the base portion via the first hinge between a concealing position and an exposing position. The first solder joints are disposed between the first pads and the leads. Measurement light from the light source apparatus is inputted from a side surface, refracted and reflected at the side surface of each depression, and then outputted from the opening of each depression.

1459828160-1d2c5b24-b479-4143-8dd6-0be18b1c2c37

A mount is fixed to the floor of a vehicle, and supports a computerdisplay unit by means of an indexing cylinder assembly. Carbonate ion and nitrate ion are concurrently reduced to deposit carbon nitride films on the substrate. The inductive device may be a transformer with two or more windings, a choke coil with only one winding, or other inductive device. The system 20 is formed as a combination of a hydraulic ram traverse system 22 providing both pull back and pull down force; and a winch pull back system 24 providing pull back only. The communication port provides a cellular link to an Internet service provider for two-way electronic message transfers by the personal digital assistant.

1459828160-685ad280-5a4a-4197-aa fb-ade f74ae9cb4

A communication system including a bus, interconnecting first and third party surgical devices, and a touchscreen, operated with the bus and displaying replicas control interfaces of the first and third party surgical devices, and facilitating remote control of the first and third party surgical devices during a surgical procedure. If the job profile is selected through the UI, the driver unit controls the image forming apparatus to perform a job by applying the job option information corresponding to the selected job profile. The shafts 212, 213, 214 and 215 may be freely extended into a locked fully extended position 201 and released via depression of a first engaging projection 239.

1459828160-be0231c1-4de0-49c5-9128-5a2bed47b7c3

A method for providing and reading micro-discrete indicia on a gemstone using near-field optics. A supply channel for the gas mixture opens into the combustion chamber. \u201cCloseness\u201d can be evaluated using a similarity function chosen to suit the domain and/or application.

1459828160-e8d4d19c-c49f-43d8-b0a0-96e3d75aef75

A method and system for routing a communication through an alternate carrier. The present invention has great applicability in military optical system applications for detecting the presence of an enemy employing surveillance equipment and for neutralizing this surveillance capability. An other object of the present invention lies in the uses of such products in any sector making use of mineral materials, and notably in the paper, paint and plastic industries.

1459828160-ef9c8983-da5d-4238-a811-8a6c83b32a1e

A positioning system is provided having a first signal source for originating synchronous signals, and a second signal source for originating a signal which is

not synchronous with the signal from the first signal source. The fusible conductor is fused off to break a current path when the abnormal voltage is applied to the equipment. A second semiconductor component substrate, such as a carrier substrate with interconnect elements such as terminal pads, is adhered to the first semiconductor component substrate, forming a semiconductor package assembly having interconnect voids between the corresponding interconnect elements. However, as soon as the scooping motion is completed by clearing of the spoon bowl from the food, the bowl portion is unclutched from the handle portion and becomes freely pivotal like a pendulum so as to remain level from side to side irrespective of rotation of the handle portion as a user moves the loaded spoon to the user's mouth. The reinforcing fabric has first and second spaced end portions with a first free end at the first end portion and a second free end at the second end portion.

1459828161-21cf45fc-d1dc-4ca1-85b7-cf9ea301e0ed

Embodiments of a proxy internet group management protocol client and methods for providing multicast broadcast services in a broadband wireless access network are generally described herein. The trailing arm includes a chassis mounting feature, an axle mounting feature, and an arm portion intermediate the chassis mounting feature and the axle mounting feature. The steam is passed through a generator, which supplies mechanical or electrical power to an appropriate drive system of the vehicle. The radiation energy is increased and/or decreased.

1459828161-2ef704eb-4a46-4c1c-b849-70dd7dcb2b23

Provided is a method of forming patterns of a semiconductor device, whereby patterns having various widths can be simultaneously formed, and pattern density can be doubled by a double patterning process in a portion of the semiconductor device. Another exemplary method includes calling for delivery of electrical energy to cells destined for implantation in the body or cells already implanted in the body. The CPU 101 calculates an average value of these resonant frequencies and applies a drive command to mirror drivers 1022 of the exposure units 6Y, 6M, 6C, 6K such as to drive all the deflectors into oscillations at the average value. Each lift beam attaches to the flexible structure at one of a plurality of designated jack points, and lifts the flexible structure off the ground when the upward force is imparted by the lifting mechanisms. In particular, the present invention provides a device and methods for the simultaneous detection of hemoglobin and transferrin in fecal samples, which permit a more sensitive diagnosis of occult blood in fecal sample and a differential diagnosis of bleeding of the upper GI tract versus the lower GI tract.

1459828161-70c4e55d-3ad4-4431-a9cf-2954cd6d85c7

A resonator includes a hollow dielectric element having a hole therein, a helical line unit including a plurality of helical lines formed in the hole, and a ground electrode formed on an outer surface of the dielectric element. or higher and lower than about 120 C. The drilling fluid attenuation coefficient may be determined via processing amplitudes of the predetermined wellbore reflection coefficients. Congestion pricing via online auctions can be employed to coordinate the use of system resources by clients, so clients can detect shortages and adapt their resource usage. The switch routes the status information of the different non-selected computers to the central unit of the selected computer. The control circuit compares ground fault current of either polarity flowing through the sense resistor to a prescribed value.

1459828161-cac03516-8431-4c29-aed7-88f9dc2b4845

In one embodiment, the present invention includes a multicore processor with a power controller to control a frequency at which the processor operates. In one embodiment, the invention comprises blocks shaped to resemble musical symbols used to compose music, including time signatures, notes, rests, and dots. The devices can include a programmably adjustable index and/or speed profile for the pusher assembly. Using the corrected parameters, third positions indicating the positions

of the indices on the captured image are calculated.

1459828161-cde64df2-b051-43cd-9de9-216ac6fdbf4a

In the present invention, in a pre-recorded information recording region on an optical disk capable of recording in both a land and a groove, a first address region is displaced off a second address region along the length of the track. A first stage of the combined machine is equipped with an intake for the two-phase fluid, in which the two-phase fluid is sucked, pumped and partially separated into two distinct phases. The lid and the substrate are placed together in substantial alignment such that the pre-tinned low melting solder band of the lid contacts the metal stack of the substrate and thermally sealed in a controlled atmosphere.

1459828162-87d4d274-c983-4f84-bb08-37dc40429687

A transistor drive circuit uses multi-stage slew rate control to drive one or more switching transistors. The method comprises: searching for said framing data block from a received multiplex signal; demultiplexing said one or more data units according to the information in said framing data block; generating one or more demultiplexed signals from said demultiplexed data units, and forwarding said demultiplexed signals for decoding. Formed upon opposed sides, of the substrate are layers of thermally conductive compositions, which preferably comprise certain novel graphitic allotrope compounds. A sublithographic aperture is formed through the bottom of the non-sublithographic via and extends to a buried conductive material.

1459828162-9e442add-9fbe-44a8-9ac0-b1e20cf3f9f7

A catheter assembly and method includes a multi-lumen portion having a guide wire lumen and an inflation/ deployment lumen. Images of different sensitivities are formed from the same scene to be observed. The integration rod is disposed in the sheath, and the sheath is disposed between the frame and the inner wall. One of the functions includes a navigational component. To display one pixel, in the light extracting portion and a plurality of other light extracting portions, the incident light is selectively taken by being switched between two directions of the transmission light and the total reflection light, thereby enabling the gradation display by area gradation to be performed.

1459828162-fa2392f1-74d9-4693-9f39-54f11749bde4

A method for storing a plurality of still images to form a panoramic image. The application protection method generates a key needed to execute the application which is provided to a user terminal using information on the user terminal, information on the application, and a part of text; and transmits the generated key to the user terminal. The switch is configured to such that when in a state associated with causing, or potentially causing, NBTI damage, both of the second pair of p-type transistors are in an OFF state for preventing NBTI damage thereto. The outer layer is made from material which is cut resistant thereby preventing the user's hand from being cut or punctured and also preventing the heat resistant layer from being damaged.

1459828163-136a8c6a-de48-4eac-aa38-2ce2c1795431

A defective position of a sample to be tested is detected by irradiating the test sample and another test sample with electron beam while scanning the test samples, storing values of current generated in the test samples correspondingly to electron beam irradiation positions as current waveforms and comparing the current waveforms. A subsequent active area level STI scheme, in conjunction with front gate formation over the semiconductor layer, is also disclosed. A plurality of the processing nodes are combined into a plurality of sub-networks that comprise the network apparatus. Debinding and sintering are performed in a same furnace, and a temperature T of the base does not fall below TE<sub>1</sub> during debinding and sintering. In this case, Ogako means sawdust or tipped small particles of wood which is raw material in order to produce a woody pellet fuel.

1459828163-1e3de5e2-bf2d-449a-828c-f221758dfc30

A foil strain gage is attached to a strained section for outputting a resistance change proportional to a strain generated at the strained section. The method includes the following steps. The switching mechanism for each rail is capable of driving the rail at the function-generated waveform or switching to an external source waveform. Applications included solar energy harvesting and heat signature detectors. The cloth strands can be used for cleaning dust or other accumulated dirt or a disposable cleaning sheet can be wrapped around the cleaning strands and retained in position over the strands and the base member by resilient biased members integrally molded from the top wall.

1459828163-57ead079-687e-436e-9b78-4016d58ad4f0

There is provided an internal intermediate pressure multistage compression type rotary compressor capable of reducing a height dimension while reducing the amount of oil to be discharged outside. The standby signal generating circuit generates a first standby signal and a second standby signal in response to an active signal, a clock enable signal, a first column address strobe latency signal, and a second CAS latency signal. The physical gateway and the sophisticated gateway are connected via a second connection of a second non-IP physical data transfer standard. The particles generally exhibit a packed powder specific resistivity of 105 ohm-cm or less and generally have a mean diameter of 0. An insulating plate with openings into which spring contact elements are introduced is provided on the housing trough which opens upwards. The guide track has an upper track and a lower track.

1459828163-d5fa56c1-9edf-4617-b43f-3e8bd56b25d2

The thickness of a thin film can be measured based on the X-ray diffraction method. The stator iron core includes a yoke, teeth, and U-shaped grooves. The handles or arms pivot together with and in the same back or forth direction as the pedals to which they are interlinked. Tight control of the exposure of the pixel structure to the electromagnetic radiation allows the pixel structure to operate optimally in order to provide an optimal captured image.

1459828164-33bfd680-e04e-4598-8b81-583a36da1a4b

A method and system for processing graphics data in a computer system are disclosed. The elbow connector is implemented by encapsulating the one cable end with thermoplastic material and including a metal sleeve which is placed in contact with the outer cable conductor to define an outer conductor of the elbow connector. First to third gate output enable signals are applied to the gate driver.

1459828164-6127f585-849d-41f1-95cc-ab6293c5a689

A first insulating layer is formed on a suspension body. A supercritical water oxidation, water purifier may generally include water and oxidizer pumping and mixing apparatus, a supercritical water reactor, and a system for separating the resultant purified water from other relatively harmless outputs of the supercritical water reactor. A digital delay line is arranged as a plurality of cascaded sub-delay lines each sub-delay line providing one of a plurality of delay quanta in response to the digital delay line control signal. The packet sink then forwards the data to a monitor, the information content depending on the level of traffic in the network.

1459828164-dd839724-10ff-4290-95cc-d2fc88e40236

An optical disc apparatus capable of improving an overwrite performance for performing an overwrite operation on a re-writable type optical disc. The PLL charge pump includes a constant current source that generates constant current source references with high power supply rejection for the P- and N-channel devices of the charge pump. Desirably said compatabilizer is an epoxy functionalized natural rubber. The level of activity may be monitored by observing the input and output pin of the logic blocks.

1459828165-44784622-47f6-4a89-b19c-095e7df242d1

This invention includes a circuit for the prevention of acoustic feedback between an electronic device and an audio accessory. In general, the system comprises a fluid source comprising a pressurized fluid; at least one programmable sprinkler head fluidly connected to the fluid source; and a computer system configured to control the sprinkler head to precisely deliver fluid according to a pre-determined sprinkler function. The 103 gene is disclosed herein to be differentially expressed in TH2 cells and not in TH1 cells. In one approach, the anti-arcing circuit includes two different paths and components associated with a detection mode and operational mode respectively. The processor is configured to run a process that maps network switching functions of each of a plurality of virtual machines to the hardware network interface device. A prank call signal unique global identifier combination triggers the prank call server to store all available call data for a referenced prank 911 call in to a prank call database, for subsequent prank call filtering analysis.

1459828165-a6dd677a-4263-4ad9-9f2a-14eb5dfe249e

A seat assembly for a personal watercraft, comprises a seat portion. The inlet section may have a relatively small cross-sectional area that promotes mixed phase flow of liquid and vapor refrigerant. The sub-frame has a part having a substantially V-shaped configuration in a side view. As a result, light beams can strike a biological body in a near-perpendicular angle. This tantalum powder has a large specific surface area, and when the tantalum powder is used as an anode of a solid electrolyte capacitor, a solid electrolyte capacitor having a large capacitance and a low leakage current can be obtained. The passband carrier frequency is adjusted to define the guardband and the guardband corresponds to a first notch in a channel response of a first communications channel.

1459828165-ecc450bf-2dfc-4bd3-98ed-ce4798c848f7

The invention relates to a device for representing surface colors for simulating print results through a screen, comprising at least one light source and a projection surface. The second circuit has functions of saving the data retained in the first circuit in the first period and retaining the data saved from the first circuit in a second period during which application of the power supply voltage is stopped. Each of the multiple software components is configured to perform a single and complete function. An insulation distance between the metal lead and the metal base is at least 0.

1459828165-ef13d22b-b7df-481d-8935-aa8d640b5f65

The present invention provides for crystalline cPLA2. The outer bracket comprises a pair of outer plates projecting in a lateral direction with respect to a cylinder axis. The altered configuration information helps assure that the storage device will be recognized as a foreign device in any storage subsystem into which it is subsequently inserted. The arrangement results in a fluid-tight and electrically conductive connection of the pipes.

1459828166-30edfd53-c588-454b-ac55-054fa8d88779

A sample rate converter suitable for use in an audio DAC includes a first estimating circuit generating first and second signals synchronized to an asynchronous clock and representing the period and edge arrival times, respectively, of a reference clock. Using high lateral spatial resolution, energy is deposited in the multilayer coating in the vicinity of the defect. The retainer has lifters that project into the guide-receiving spaces, so as the guides move rearwardly along the spaces they lift the lifters which lift the latch to facilitate rearward movement of the fiber block during mating of the connector and connector device. The pathway switching mechanism includes a pair of upstream-side gate members and a gate member pivoting unit.

1459828166-407215cf-3a22-4dd4-be69-ddc5f271e5cd

A video data communication system and method are disclosed which provides for the secure transmission of video data among devices connected to a video data bus. The wheel is fixed with, for example, wheel bolts to a wheel hub, pivoting on the axle stub of the axle tube, and the axle stub is clamped on to an end section of the axle tube as a separate component. Data signal channels are paired with a reference channel between each two adjacent data channels. The language used for the labels is selectable by a user via a menu, and the corresponding entries in the database are used in building the representations. The invention communicates a \u201cclean sweep\u201d metaphor, i.

1459828166-f6613fdb-45df-4461-b303-0c6ee2b76649

In an embodiment, a method is provided for communicating a medical prescription with a mobile processing system. Each attribute is associated with a set of patterns. Also, after a predetermined amount of time, the controller may stop operation of the motor if an article is not inserted into the throat.

1459828167-01f60960-4b8f-4036-8add-7869fa2f567a

Certain exemplary embodiments comprise a system that comprises an application specific integrated circuit configured to provide an output signal. This may include obtaining and storing a unique onboard signature and/or physical characteristics from entering vehicles or mobile entities for matching with the identity information obtained from exiting vehicles or mobile entities. The truck bed is effectively widened as the sidewalls are laterally positioned in weight bearing relation by abutment members which depend from the sidewalls. The GUI includes a user interface tool for dividing the timeline into segments. The image processor is further configured to identify a number of clusters in the vectors of the image data in the three-dimensional mesh. Thermal isolation is provided between the housings and the flowcell body, and air circulation further reduces temperature and condensation within the housings.

1459828167-ce2faa12-611f-4fd8-be41-6e92f1999095

Systems and methods for virtualizing network intrusion detection system functions based on each packet's source and/or destination host computer operating system type and characteristics are described. The connector comprises a housing and an actuator. a destination e-mail address, in accordance with an assignment relationship between characters and numerical keys. Optionally, a divided wall column fractionator can be used to allow a single separation stage to handle the effluent from both the hydroprocessing and the dewaxing stages. A closed-loop control operation of the optical head is performed according to the light intensity addition signal after the light intensity addition signal up-crosses a threshold. Exemplary content segment types include text, line art, and images.

1459828168-0f7cc13c-84a8-4910-97d0-af4062ffefac

A stator iron core of an electric motor including plural magnetic pole segments connected and confronted by plural confronting surfaces. In one embodiment, a source identifier is assigned to each instruction in an original control flow graph representing a program code prior to optimization. The first track, which is formed of portions that are keyed to the frame, defines a nonlinear cross section.

1459828168-14afc86c-0a15-4f98-94e0-1130a4d8a49d

The invention discloses a method for attaching solder members to a substrate. The gas holes pass through the pedestal and provide channels for gas to reach the semiconductor wafer. The hoop conduit carries water from the main water line when the valve is actuated and is movable from a first position flat under the seat to a second position below the seat opening. The mirror and the imaging device are oriented such that the mirror and imaging device are in the same plane, an optical axis of the imaging device is substantially perpendicular to an axis of rotation of the rotatable platform, and an axis of rotation of the mirror is substantially

parallel to the axis of rotation of the rotatable platform when the mirror is in an initial position. The second is a more complex and accurate model that models cell dynamics in discrete-time state-space form. Some embodiments of the assistant are also capable of improved performance over time by both automatic and manual feedback.

1459828168-b3b1be4f-9820-4856-87e5-99a95ad4dab3

An electric-motor-equipped vehicle of the present invention includes an electric motor which receives a power supply from a storage apparatus and drives the vehicle, or assists a driving of the vehicle by an internal combustion engine. For each of the plurality of step voltages, different digital values are allocated to different steps of the step voltage. The light is totally reflected at those reflection faces which are not immersed in the liquid but refracted into the liquid at immersed reflection faces. In other embodiments indicia are provided as quick response codes, and as various markings to indicate compatibility of the medical device with ethanol. The floating gate transistor provides a dense and planar dynamic electrically alterable and programmable read only memory cell adapted for uses such as for a dynamic random access memory or a dynamically refreshed flash EEPROM memory. The alternative clevis arrangement is inherently balanced and can meter fuel through multiple nozzle orifices simultaneously.

1459828168-d08951d5-d16b-4934-9a49-29f8b4afd7a7

In the present invention, for each set of blocks # to # storing update data, a history block # storing an update state value, for example, a generation, time or check code, showing an update state is provided, constituting a set of management data as a check object. An opening structure is disposed on the casing. Furthermore, the present invention relates to a pharmaceutical composition for oral use with improved absorption, which comprises a biologically active peptide and aminoalkyl methacrylate copolymer E. A carrying handle and straps are used for ease of transportation while providing a large water-resistant storage compartment along an external surface for storage of sunscreen, food, books, refreshments, and the like. These partial accumulations are in turn added together, or accumulated, to form the total accumulation over the desired time period. If input information is in natural language, the linguistic knowledge base is used to analyze the input natural language information.

1459828168-f7d3c4ac-0fce-432e-ab71-0299a6278e5a

A turbo decoder system utilizing a MAP decoding algorithm has a predetermined number of turbo decoder modules for decoding segments of a turbo code component code word in parallel, thereby expanding the block-length and data rate capability of the turbo decoder. The clock signal operates as a set signal of the next stage flip-flop and outputted as a control signal for carrying out pre-charging of a data signal line and a selected pixel connected to the data signal line, with a switch. The quadrupoles are mounted symmetrically to a center plane so as to permit excitation along a linear axis. Afterwards, at least one alarm message is generated in response to detecting the anomalous activity in accordance with at least one predefined long-term security data mining program.

1459828169-636de49f-cc54-4acf-b647-fec0914527f8

The present invention relates to a semiconductor device and its manufacturing method. Subsequently, the delineation trench or open area may be etched down to the respective etch stop layer in a further common etch process, during which a trench is formed above the via opening. The free fall is identified by detecting the ambient pressure. The distortion generator may also include a temperature compensation circuit to ensure consistent operation throughout a wide temperature range.

1459828169-ab6e4c6e-82d2-455f-938d-53c9278a5a25

A zero pressure electromagnetic server mainly includes an electromagnetic

controlling valve stem. Upon first encountering a given portion of program code, only the target code necessary to execute that portion of program code under a prevailing set of entry conditions is initially generated and stored. Such features include rendering selectable diagnostic information on a system component navigation view. After a delay time following a transition of the input signal, the circuit operation of the post-push-pull driver is turned off before the amplitude of the output signal reaches its maximum overshooting. In addition, the actuatable element and the sidewalls may be so shaped as to maintain a generally constant width between them. The method can include detecting IEDs by sensing the presence of a non-linear electronic component of an IED.

1459828169-d1db9cae-b8b5-469e-b500-a21e07e42624

Methods and systems are described for processing a request for a resource in a communication. The sub-view video stream includes metadata arranged in each GOP. The partially assembled compensator is then assembled while immersed in the fluid and under a vacuum for a second time period. The system establishes, at predetermined transceiver power levels, a mutual electro-magnetic coupling which is selective exclusively for a single transponder located in a defined transponder operating region. The OTFT of the present invention shows low threshold and driving voltages, high charge mobility, and high Ion/Ioff, and it can be prepared by a wet process.

1459828170-0092f5ba-679a-4d69-8f96-bd5738913fee

A seismic data acquisition module includes a motherboard that is environmentally protected as a independent unit by an integral sheath, envelope or encapsulating cover. The tissue support device engages the tissue proximate an opening in the tissue and biases the tissue support device to bring the engaged tissue together. The excitation wire 7 is wound around the first, second, third, seventh, eighth, and ninth teeth 2 in a concentrated fashion to generate an identical polarity and wound around the fourth, fifth, sixth, tenth, eleventh, and twelfth teeth 2 in a concentrated fashion to generate a polarity which is reverse to the formerly mentioned polarity.

1459828170-1f8adc2b-88ce-4972-bc71-a0be1ed7c5fa

A dryer for a refrigerant circuit of a refrigerator includes a housing with a first and a second passage orifice. The top layer is etched to provide a contour in the top layer while leaving the lower layer unchanged. Furthermore, the main piston has a small end portion which together with the housing define a second cylinder space and whereby fluid at increased pressure can be moved out of the housing via a high-pressure fluid outlet when the third cylinder space is supplied with compressed air. A part of the transparent dielectric layer is formed between the contact electrode and the pad electrode.

1459828170-bb05109d-91ac-432e-845a-d22ac31cfc8f

Disclosed herein is an electronically controlled valve. Also disclosed are nucleic acid sequences encoding the oxygenase enzymes. Before detection of the external start signal, the new measuring section is shifted to a pause state and after the detection of the external start signal, transition to a measurement state is made. The surface profile is corrected based on the field- and orientation-dependent errors.

1459828170-ce0d5940-9984-428f-b601-59a9d18ecf8e

The present invention provides a semiconductor device and a method of manufacturing a semiconductor device in which a driving force can be increased by increasing a strain amount given by a stressed film in a MOS transistor including an elevated region. Consistent link sharing includes receiving a request from a user to store a web page that resides on an originating server to one or more share servers. The invention also includes expression constructs used in the method. The first functional resin sub layer and the second functional resin sub layer serve as

retardation layers with different optical axes from each other. Network nodes are scanned to obtain a network node information record including a unique identification from each network node.

1459828171-09dd0db8-6924-4f7a-b358-bf64cbe5337d

An identifier of a mobile device may be accessed. Each of the at least two simultaneous streams is generated from a corresponding source. The RFID transceiver device includes at least one sensor coupled to the microcontroller. Each player interface has a rabbit button.

1459828171-4695da3d-60b0-4948-b0d6-9c8582fa519d

A method for determining affective information for at least one image in an imaging system includes displaying a digital image for viewing by a user; monitoring the facial expression of the user as the user views the digital image; and using the facial expression of the user to determine affective information for the digital image. The semiconductor device includes lateral and upper hydrogen blocking patterns disposed to prevent hydrogen from diffusing into the cell array region. Feeder track may be extended for use in active sports drills or sport games, or folded or retracted for convenient storage of the apparatus when not in use. The rotor has a passage groove for connecting two or more of the ports. The upper and lower jaw members are joined. If so, then the method displays a message to the first user during the first gameplay session.

1459828171-f86fc1e9-bbf3-4da7-be49-25eddbbe19a7

A semiconductor integrated circuit device for fast and low power operations, comprising a plurality of circuit blocks of a chip, each of which has a plurality of states with different power consumption values. The preferred exemplary embodiment comprises a pressure regulation assembly installed downstream from a compressible fluid pump but prior to combining the compressible flow with a relatively incompressible modifier flow stream. A removable water cup may be provided on one side wall of the outer housing for containing a supply of water to be used by the steam iron, and a removable accessory storage cup may be provided on the opposed side wall for holding the cord of the iron or miscellaneous small items. After an impact, the curtain's upper edge is automatically fed back into the groove by simply opening and closing the door. The photoreactive adhesive composition comprises a urethane prepolymer and a compound which generates an amine upon irradiation with light, wherein the amine-generating compound is a cobaltamine complex, O-acyloxime, or carbamic acid derivative.

1459828172-82d6122e-c3f0-4f5e-b5ba-5e0ce2b079ae

The airbag apparatus includes an airbag housed in a folded state and an inflator for supplying inflation gas to the airbag. The evaporated fuel purge system is pressurized and depressurized through a venting flow path by a pump, so that the state of leakage therefrom is thereby inspected. The method also involves identifying a digital signature embedded in comments within the file. When at least one of a number of result sets that may be stored and a number of bucket tables that may hold result sets is modified, it is determined whether any of the one or more result sets are to be removed. A hyper-text link is associated with each device button, wherein the hyper-text link provides a link to an HTML page that is contained on the home device that is associated with the device button, and the device link page is displayed on a browser based home device.

1459828173-11818856-638e-4a0c-ba67-35661d09904d

An apparatus and method for making a composite packaging material for easy-open packages includes means for pulling a running length of packaging film, the film having defined rupture characteristics. The progress of the tasks is shown in a list in an information window. There are both mass-produced as well as handmade versions that are distributed by hundreds of companies large and small.

1459828173-727850b1-c54d-4ce2-b1cb-35d19f7bd0e4

A system, method, and computer program product are disclosed for prohibiting unauthorized access to a protected region of memory. The information processing system includes at least one user input device, a transcription center at which voice files received from the at least one user input device are transcribed to text format and a natural language processing system receiving the transcribed voice files for analysis and processing. The system of the invention instantly and continuously provides information that assesses a user's current physiological state during exercising in view of the exercise situations and the environmental conditions. Fatigue risk values are determined from the sleep and wake state values, using a state algorithm. The system further processes data to geographically distribute the data with data processes including: copy, extract, archive, distribute, and a copy-extract-archive and distribute process with a sequential and supplemental data destruction process. This approach allows a single ADC to be used in time-critical applications that require all the analog sensor values to be measured at the same time.

1459828173-bbb91c03-09b9-4bf0-84dd-26d1d0b7ccff

Techniques for providing multi-directional receiving antenna arrays are described herein. The controller activates one or more selected pathways in response to information from the detector to regulate energy transfer at a detected region of risk 66 on the mattress. Therefore, no sharp corners will emerge at a border of a gate oxide subsequently grown on the exposed surface of the substrate, and the gate oxide is thus morphologically improved, thereby resulting in an improvement of the reliability of the high-voltage semiconductor device being fabricated. A vacuum assist can be used to help impact the lumen wall on the spikes. An interior chamber is in communication with the outlet port and surrounds the filter unit. The interactive account management system may include a financial networking engine implemented by a processor for defining a financial network for each account holder and for identifying each member of an account holder financial network based on stored account information and account holder input.

1459828173-d826d368-87bf-45a5-a16f-366e937411c4

A frequency-phase adjusting device includes a first controller, a second controller, and an oscillating circuit. Embodiments of the subcombination and the fruit extraction device of which it is a portion shear the peel in multiple slivers, at the same time compressing the fruit. Systolic registers may be included at various points in the DSP blocks to facilitate use of the blocks to implement systolic form, finite-impulse-response, digital filters. Running in the user space is an event collector, an event player, and a concurrency error detector. A target gear speed shift transmission instruction detector is configured to detect a target gear speed shift transmission instruction.

1459828174-02b089c4-f881-4260-9936-8ec36b8984f1

Disclosed is a shaped container bottom for containing a plurality of curved snack pieces where the container bottom comprises a bottom panel. The semiconductor chips have a base and connection bumps. Thereby, the cylinder distance can be reduced while maintaining the thickness between cylinders and the assembling is facilitated.

1459828174-7074d82a-136c-40d7-b932-e94a25806b5a

A method of fabricating a trench capacitor of a memory cell. The end of the lace is received within, looped through and held within the tubular members of the lace end receiving device. The stabilizing foot is pivotally secured to the bottom ends of a spaced pair of arcuate elevating leg members that extend upwardly through openings in the bottom side of the housing. In any case, the phase transition material are pre-selected so as to be insulative when the MOSFET is in the OFF state and the voltage difference between the drain region and the source region is high in order to minimize leakage current and so as to be conductive when the MOSFET is in the ON

state and VDS is high in order to maintain drive current. The third portion has a first end adjacent to the second end of the second portion and tapers from the first end of the third portion to a second end thereof.

1459828174-7d261989-7e71-4bf8-b2ea-c57af4bc30c6

A touch panel includes a light guide including a first face for detecting the position of an object in contact therewith and a second face opposite the first face, and a line sensor for receiving light emitted from a side face of the light guide plate, wherein, of light irradiated from the second face side, the light guide guides toward the side face the portion of light reflected by the object. In one aspect of the present invention, the data resource elements are assigned to multiple code blocks, and the numbers of data resource elements assigned to each code block are substantially equal. Additionally, a source of the attempt and an attribute of the modification are verified. A Short Interframe Space value may be determined for each access point in the first list or generally SIFT representing the first list as a whole. The control unit drives the current supply when a laser wavelength is to be shifted to a shorter wavelength side from a wavelength with the current supply and the voltage supply being turned off, and drives the voltage supply when the laser wavelength is to be shifted to a longer wavelength side from a wavelength with the current supply and the voltage supply being turned off. Particularly this device has additional transient suppression means for the loads; \u201chigh side drive\u201d of the rotor field to eliminate corrosion from the low side short condition; full passivation around the monolithic chip; and a monolithic chip that contains both the power and control devices which permits a simplified heat sink for thermal dissipation.

1459828174-884db515-38b2-46d9-a559-744165af0c4c

The present invention relates to a method for making an indolopyrrolocarbazole of the general formula I, where the method includes the step of reacting a bisindolylmaleimide compound with an oxidizing agent in the presence of an oxygen containing gas at a temperature and for a time sufficient to yield the indolopyrrolocarbazole compound of the general formula I. The method further includes combining the base erasure patterns and the child erasure patterns to form a minimal erasures list for the erasure code, whereby the MEL corresponds to the fault tolerance of the erasure code. A raised cylinder extends upwards from the interior floor surface. The valve includes an element which is electromagnetically actuated so as to produce a desired pressure in the clutch pressure chamber.

1459828174-9fce7524-c91a-44f6-b49c-985892a86ffb

A holder includes a seat which removably carries a cutting insert for chip removing machining. Additionally, the depth of the gate goes to zero at a point outside of the area of the finished package, but within the dam bars, so that the leadframe space acts as a virtual gate. Optionally, the LED can be biased to reduce the intensity of the pulses used to operate the LED. In both cases the user computer requesting data delivery can either have a special automatic data reception capability or receive the data without screening.

1459828175-0802bb85-4748-48b5-b7fb-ce7754f03ca6

A multilayered piezoelectric element in which braking to displacement of piezoelectric material layers is suppressed and insulating films suitable for thinning of the piezoelectric material layers are formed. The circuit includes a DC-to-DC converter, a DC-to-AC inverter and a transformer to transform available input voltage to a control voltage that can be used to apply the electric field to the mixture in the reforming chamber. In the event that  $j$  is a natural number, a pixel magnifying projection width  $e$  in a second direction is set in a range of the following expression according to mean interpupillary distance  $Y$  of the observers. The control system further calculates optimal temperature ranges and charge and discharge rates for the vanadium redox battery.

1459828175-44143833-0fbd-48df-8b62-fe98b6a8c18c

A piston assembly for an air spring includes an outer shell and a structural insert. The method includes setting at least one of a plurality of logic elements associated with at least one of a plurality of first registers, wherein the plurality of first registers are adapted to access data stored in a plurality of second registers at substantially the same time when the plurality of logic elements are set. A receiving groove is formed in the transition between the actuating shoulder and the externally threaded portion with a first sealing ring is disposed therein. Different images may be produced for different ranges of wavelengths being produced.

1459828175-7fb7bca1-14c0-4244-9ca9-885d43de0930

The present invention provides a cable-type secondary battery capable of wireless charge. Selected desktops and/or running applications are displayed on dual screen displays. A second light guide is adjacent the first light guide opposite the display. Methods of manufacture, including kits for the manufacture of the orthodontic appliance are also included. According to the cleaning tool of the present invention, the screw part has a simple structure, thus dramatically reducing the manufacturing cost of a metal mold for producing the screw parts, as well as allowing the cloth to be firmly fastened to the screw part.

1459828175-8d6211ee-7d02-44af-9834-093be6e4b0d1

An FM tuner that has a multipath reception detection unit and an adjacent-channel interference detection unit while reducing expansion of the scale of the circuit is available. The brace includes a body panel, two stabilizing straps, and a binding strap. In particular, the crystalline substrate has an epitaxial surface which is nano-rugged and non-patterned. The invention reduces channel switching delay and thus improves quality-of-experience for the end-user. The enlarged end portion is provided with a concave articulating surface substantially congruent with the convex articulating surface of the metacarpal insert member, and the elongate shaft portion tapers generally towards a distal end of the phalangeal insert member, and is provided with a plurality of axially spaced second fins projecting therefrom. The cable is fed substantially parallel to the planar surfaces of the substrate and is attached to the side surface of the substrate, such that the cable is oriented substantially perpendicular to the direction of the electromagnetic field emitted from the sensing element.

1459828176-618f8bb4-d87a-4e1e-8859-b820f8ed0aef

A method for determining the entry point of an attack by a vandal such as a hacker upon a device such as a computer or a server such as a web server that operates under the protection of an intrusion detection system. The antenna includes a first radiator and a second radiator separate from the first radiator. The configuration database further indicates an association between the Dial instance and the configuration latch. Vref can be made to vary across its allowable range during AC self test to provide improved coverage.

1459828176-9c1aa10e-066c-4318-a154-8684f247f735

A seat assembly having a seatback and a head restraint is provided. An envelope generator 408 or detector is operable to determine an envelope signal from the data signal. Furthermore, the invention includes a device with which the cylinder block may be manufactured. One or more attributes of the wheel are measured based on the image data. The generated communicative goals may be related to information needed to be obtained from the user. The counter cutter is designed like a plate and has recesses designed corresponding to the shape of the comminution tools of the comminution device.

1459828176-9e781954-8358-46c0-b372-538505f44687

A tensioning cable actuator has a housing with a nut held in the housing. In some embodiments, the methods include the following: a. Based on the dump file, a base

version of at least one software module that was loaded when the crash occurred can be identified. When a bit datum of the output data is different to a bit datum of the write-in data, the bit of the write-in control data is enabled.

1459828177-17c4e3db-14c4-4cd2-9631-fb9bce2f8105

A system for providing location data for determining which service provide is to receive a location based telephone call from a wireless telephone set. The use of the abrasive cleaning pad and the cleaning solution removes contaminants from the CMP pad, and the contaminants are dissolved in the cleaning solution. The adjusting screw arrangement comprises a threaded sleeve that is held, preferably with play, in a smooth through opening having a narrow point and comprises a screw part in functional engagement therewith that stands in a chain of pressure force with the adjusting element. For example, separate DMAs may be provided for different components of a device that perform different subfunctions enabling efficient transfer of data between the different components of the device and the shared memory.

1459828177-39e02433-5fdc-439d-ab52-56acf798e1fd

The present invention provides a pressure reducing valve having excellent responsiveness, durability, and reliability and stable output characteristics. More particularly the present invention relates to a method and system for evaluating accurately the electrical overstress or ESD performance of semiconductor devices during the voltage transition region. A material is molded at least partially over the first core and feed core. As a result, the priority of the virtual machine can be determined according to the task priority and the switching of virtual machines can be adequately controlled even if the virtual machines cannot notify the task priority. The method is based on the concept of auto-similarity and ensures that the input information is not visible but finally be retrieved without providing knowledge of the original documents.

1459828177-c1929561-433e-4e02-86a6-fcd30ff0b9e6

A method and a device for the production of a bore with a special shape, for example a bore which deviates from a cylindrical shape or a bore with an undercut. An updating judging unit 304 judges updating of each network device by comparing an acquired configuration file and a registered configuration file linked to a first identifier representing a copy timing. The user's selection from the list may be received and played to the user. The data controller is configured to manage the encoded data in units of logic blocks when the channel controller writes the encoded data in parallel to the channels, and to allocate parity data contained in the encoded data to one plane in each logic block.

1459828178-1b2c541f-44f3-48b3-bda8-92a93c7aa6f5

An example system for inducting air into an engine includes a compressor and a turbine mechanically coupled to the compressor and driven by expanding engine exhaust. The tool spindle is adapted to be continuously swiveled about the orientation axis by a swivel drum. When the cache and pool reach their maximum sizes, idle objects in them may be removed to make room for newly active objects using various strategies in batches, where the schedule, size and processing time of each batch can be dynamically adjusted. A logical operation is performed on the modified pseudo-random sequence and for each block of the non-encrypted information. For instance, composite polymeric materials can be electrospun to form composite nanofibers within the array. A guide is fixed in the sliding groove and received in the guiding slot.

1459828178-25c5ee4c-b084-4dc1-9acf-398fd66895b9

Methods and apparatus are provided for presenting default content to a caller when a media stream of the specified type is not available. The sheet supplying device has a first tray and a second tray that hold sheets, and a first and second shaft positioned over the first and second trays. When the elongated stock is to be moved

from one side to the opposite side of the die holding member, it is passed through an elongated stock passage, not through the dies, while when the elongated stock is to be moved from the opposite side to the one side of the die holding member, it is passed through one of the plural dies. The gap serves as a diffusion barrier. The cord storage device is positioned at least partially within at least one of the telescoping arm assembly or the support member. The forward path filter may serve to predistort transmit signals prior to radio-frequency amplification.

1459828179-95a45271-5e82-4d9e-9158-8dfb145a9a6e

A plurality of repeater servers form a shared content delivery network to serve resources to clients on behalf of a plurality of content providers. Paper having a plurality of labels continuously affixed to a web liner is loaded inside the label printing apparatus when a main cover is open. The re-circulated homogenized light illuminates the filters, and the process repeats. The bridging results in improved load bearing characteristics of the connection. Particular 4-oxazolidinone compounds are shown to have anti-cancer and anti-microbial activity. The second clamp is placed adjacent the bone, the soft tissue is placed adjacent the second clamp, and the first clamp is placed adjacent the soft tissue.

1459828181-58b10708-4ee3-4723-ac83-876e849f0d08

An all terrain vehicle includes left and right vehicle body frame portions and left and right suspension arms, respectively suspending left and right rear wheels, and capable of moving up and down together with the left and right rear wheels. The first side bar, the second side bar, the third side bar and the fourth side bar are connected end to end. The seal also defines opposing slanting surfaces which provide a degree of flexure to the seal for sealing engagement. The file system reduces access to related disk files, eliminates disk operations that are needed to maintain directory and meta-data information, and avoids multiple buffering of file data, and saves and efficiently manages disk and main memory space. The configuration of the adsorbing first zone is matched to the light-off performance of the electrically heatable honeycomb body.

1459828181-58f523fe-42a2-443a-8212-8011a42e1a72

An automatic transmission shifter assembly for automotive vehicles includes a shift lever, a gate plate formed with a gate passage, and a slide block having an engagement recess to be engaged with the shift lever, wherein the slide block is adapted to be moved frontwardly and rearwardly in response to the manipulation of the shift lever. Substantially even lateral forces are applied to wires and other elongated members within the billet by inserting filler rods at one or more places along the periphery of the pack. Methods of use of the polymeric and pharmaceutical compositions for therapeutic and/or prophylactic benefits are disclosed herein. This gynecological exam device has folding and sliding panels, adjustable footrests/stirrups, and adjustable headrest built into various sections of the exam table. Also provided are antagonists or agonists of Maba, and methods for screening agents that modulate the Maba level or activity in vivo or in vitro.

1459828181-96aecc88-08a8-4324-bfb7-679b70175e01

A system for the treatment of a spine generally comprises an implant and an attachment device for securing the implant to a portion of a patient's bone. During calibration, a closed loop is utilized to decrease the differences between the common mode voltage of the output signal and a reference voltage. The ionized airflow may be delivered to a conditioned airspace by an HVAC system. The material clamping frame of each material clamping mechanism is provided with one or two connecting holes, which connect with one or more material stretching mechanisms through a universal push-pull mechanism. Cells of a microorganism or treated products thereof having activity of stereoselective hydrolysis of a 2-alkyl-L-cysteinamide are allowed to act on the compound represented by the general formula to yield a 2-alkyl-L-cysteine. A relatively highly loaded access point can reduce its beacon power so that one or more connected mobile stations will migrate to a

further access point covering the migrating mobile station.

1459828181-c4678b37-e952-420d-9640-a6b0259e14bd

A paper-feeding device for use in an image forming apparatus that includes a tray on which a recording sheet is configured to be stacked, the tray having an upper surface and a lower surface both being exposed to outside. The mask blank includes a reflector on a substrate. The at least three light-emitting units and the at least three light-receiving units are both arranged in equal distance with respect to one direction. An acceleration resistance is determined using the target acceleration and a constant based on the vehicle weight. The system is capable of measuring or inspecting the sample such as a photomask at high speed and with high accuracy even when the sample has a large amount of charges accumulated on its surface different from its pattern surface.

1459828181-d4bcf4db-25f8-48aa-a25a-fb228d4c1e18

The present invention is directed to partitioning agents and methods of using same to effectuate separation of a reactant, intermediate product, and/or final product from a reaction mixture while minimizing the need for traditional separation or isolation techniques. The communication processor module utilizes commercial off-the-shelf components as well as programmable logic devices, which are programmed to provide a watchdog timer, programmable interrupt controller, flash page addressing, ISA bus decoder and controller, and various circuits and logic. A plurality of tubular ammunition sleeves are secured in parallel spaced relation to the back of the hand face of the palm sleeve. The sensor transmits the transverse location of the web at the second positioning guide to a controller.

1459828182-0a78553d-e310-4cc9-9337-6bcd3c8dd983

Method and apparatus are described for ensuring that blood transfused into a patient is the correct blood for that patient, and that a complete audit trail is created that will allow later tracing of blood from donation through to transfusion. The axially inner base rubber layer is disposed on the radially outside of the belt and centered in the tread width. Variable matching thresholds can permit dynamic adjustment of image quality and computational cost to optimize encoding performance for available computational resources.

1459828182-21c4756b-9ea4-41e8-9ad0-3fe65c18033e

In one illustrative embodiment, a computer implemented method using asymmetric memory management is provided. The supported metal membrane is obtainable by applying the metal membrane to the support surface of the membrane support, wherein the pores in the membrane support are sealed, at least in the region of the support surface, prior to applying the metal membrane and are opened by removing the auxiliary substance only after applying the metal membrane. The transducers, actuators and sensors which utilize ionic polymer membranes solvated with ionic liquids have long term air stability.

1459828182-740ca8ae-a5aa-48a3-8a3b-a29ee315404f

Herein are disclosed an apparatus and method of explicit indication of call from emergency call center. One described method for braking an actuator includes generating a first actuator signal configured to drive the actuator, the first actuator signal having a first frequency approximately resonant to the actuator, and transmitting the first actuator signal to the actuator. One or more elongated heat sink LED modules each having two or more LEDs and electrical component parts thereof are retained in each of the modules. The caulking barrel is connected to the gearbox.

1459828182-a6537a7f-c420-4e89-ac88-9feeb0929211

There is proposed a washing solution for washing an inkjet printer head which performs printing by feeding an ink comprising at least two kinds of polymerizable compounds each differing in viscosity, a photopolymerization initiator, and

pigment. First, a single crystal silicon film is formed by using a typical bonding SOI technique such as Smart-Cut or ELTRAN. An oil product and a gaseous hydrocarbon product are produced during the pyrolysis. The retention latch can also be used to initialize at least one of the first and second flip-flops when exiting the low-power mode. Said shell has through-air-inlets.

1459828182-c17c9312-73b6-4aed-bc2c-29a502e0cd6a

Methods for treating cough, chronic cough and urges to cough associated with respiratory diseases with a P2X3 and/or a P2X2/3 receptor antagonist, the methods comprising administering to a subject in need thereof an effective amount of a compound of Formula (I) or a pharmaceutically acceptable salt thereof, wherein R1 and R2 are as defined herein. Preferably, the louver structure includes a plurality of louvers inclined at an angle between about 20 degrees to about 60 degrees relative to horizontal. Watermark braille is similarly processed.

1459828183-0c6becc9-4aab-4254-86d5-1a1e5da21551

A computer that is programmed with collaboration software receives a new value of an attribute which is specific to a label as applied to an object managed by the computer. 0 mm or less, the thickness of the lattice area is 0. The boxes include electronic locks containing event memory, sensors and alarms, and RF communications and GPS locator module that radio to a base station the time, location and status of the inventive box, and anomalous events as they occur, including unauthorized attempts to open or break into the container, or potential damage events.

1459828183-56ab91db-430f-4067-9cd5-c76ea7620181

A remote-controlled door lock has a case body provided with a battery base, a circuit board and a braking device therein. Rear projection screens including such Fresnel lens sheets are also provided. The reference counter of each of the cache lines in each cache level is tracked so that a cache line is not overwritten with new data prior to transferring old data out to the recipient device. In a bingo game machine, a first bingo game using only the first selector and a second bingo game using both of the first selector and the second selector are performed. The aromatic polyimide ester comprising: a repeating unit represented by a following formula, (I).

1459828183-8be4b1b3-ea74-455e-9b2d-87df3b4f27c6

Medical devices, as well as methods of treatment and manufacturing such devices, are provided for applying vascular therapy locally within the body vessel. A plurality of signal repeaters are tuned to the frequencies of the radiofrequency signals, and a plurality of transmission lines terminated by resonance circuits are also provided such that the terminating resonance circuits resonate on the frequencies of the electric radiofrequency signals. The retaining ring is connected to and vertically movable relative to the base assembly and has a lower surface configured to contact a polishing pad and an inner surface configured to circumferentially surround the edge of a substrate to retain the substrate. Each color light is guided through a light valve to adjust the spectral transmittance of the color light.

1459828183-9202233b-464e-4983-bd7b-741796683d58

A display system reduces latent image formation by shifting an image between a first position and a second position, displaced only a few pixels from the first position. The manually operated control panel is energized or de-energized with full automation by the movement of the overhead dock door. The gateway node comprises analyzing means adapted to detect if for the requested call the first and second mobile station are handled by a common radio network node and, if yes in generation means generate, and provide, interconnection information in a message to the server node including information about channel or circuit resources.

1459828184-8697973b-8f88-4a27-b03e-41320b9e0eaf

Circuit and methods provide for adjustable power consumption using a plurality of memory controllers. The method includes steps for sorting the three input values by magnitude into a high input value, a middle input value, and a low input value. The tamper-proof label includes two forms of coding.

1459828184-87580193-f632-420f-b25c-8d7823034da5

A specially designed rotary indexing system and associated operational methods are incorporated in a downhole control device, representatively a sliding sleeve valve, having an outer tubular member in which an annular plug seat is coaxially disposed. The fittings are screwed to the backrest frame. In an embodiment of a system of the present invention, the system includes a buffer memory for receiving a recorded communication from a service provider network and a content analysis system coupled to the buffer memory.

1459828185-293359ff-25f1-438d-b6a4-6b699124519a

A system that implements detection and reconciliation of system resource metadata for a distributed storage system is described. Each set top box includes a network extender having a wired connection to a residential gateway of a local area network, a media player in communication with the network extender, and at least one wireless transceiver in communication with the network extender. Cementitious compositions containing the treated aggregates are also described. Each embedded resource request is associated with a component record identifier that is associated with, but different from, the record identifier of the original resource request.

1459828185-31084de3-0248-4cf7-909d-3453a59448ec

A tool facilitates a balancing of security with usability enabling secure user access to multiple secure sites and locations from several computing devices. Images are generated that represent the volume of each search query relative to all search queries over a period of time. A notification technique is also provided to notify a user when the image or images being displayed is color corrected. The slot 14 is composed of a first aperture 15 extending in a straight line, a second aperture 16 communicating with one end of the longitudinal direction of the first aperture 15, and a third aperture 17 communicating with the other end of the longitudinal direction of the aperture 15. Certain conditions are used to determine if a switch from one type of stage processing to another type of stage processing is needed. The invention enables a seamless transition from Continuous Conduction Mode the Discontinuous Conduction Mode and Pulse Skipping and provide converters that are efficient at low current loads.

1459828185-4067a8c8-6305-4f61-9688-87d831fc9824

According to one aspect of the present invention, a reporting method in a wireless communication system is provided. In particular, the invention provides high optical quality molds and inserts useful for manufacturing silicone hydrogel contact lenses. Moving the protocol translation processing from the host processors to the MOE hardware unit removes the protocol processing load from the host processor and significantly increases performance of data transmission among sources and sinks across a network layer. As a result, the number of types of pieces of ink data referencing the table can be 2, thus suppressing an increase in the table size. The sensor wrap may advantageously include disposable tape layers including an information element, a breakable conductor, or both.

1459828185-51d4a512-5b35-4498-877e-abef1c346bca

The invention relates to a method for electrodynamically braking a rail vehicle that is provided with a drive unit. The computing system includes a plurality of interconnected processors and corresponding local memories. The external container is provided with a suction port for sucking external air in between the internal container and the external container. The match is then determined to be unauthorized, and a claim is issued against the unauthorized uploaded content. In

this manner, the worker thread may wait for a response from the corresponding clients, while the one or more corresponding session threads continue to backup the stored data and generate backup history.

1459828185-58104847-6779-4162-a251-7da794b87eaa

The present disclosure relates to a passive optical network and provides a method for maintaining the PON, the optical network unit, and the optical line terminal to solve the problem of the ONU being in a constant light emitting state. The method includes calculating a failure probability for a transmission over the network, determining a target value for determining a contention window according to a mapped function of the failure probability, and altering the contention window according to a scaling function of the target value. The thermal equalizer at least partially surrounds and is in thermal contact with the optocoupler unit and is formed at least partially from a material having a high thermal conductivity. Thus, the distance between the upper portion and the lower portion of the endless belt is made smaller than the diameter of the driving roller.

1459828186-91876187-326c-47cf-9a1f-8af048e29c47

A Collapsible Bed Cap for Trucks is disclosed. The device comprises a pair of elongate plates 122a and 122b that are biased towards one another to grip the wrapping material between them. The method can be implemented in a system in which several digital recorders use the same storage. The first write pending indicator is reset after the data is written to the primary data storage device, and the second write pending indicator is reset after receiving an acknowledgement back from the secondary data storage system controller. In another embodiment, a method of simulating a radiation signature of an asset using quantum dots includes dispersing quantum dots to form a cloud of quantum dots; and exciting the quantum dots with a first radiation so that the quantum dots emit a second radiation having a profile similar to the radiation signature profile of the asset. The end portion is rockably attached to the cover mounting portion of the main unit by means of a hinge mechanism.

1459828186-d7004541-3743-4136-8573-69ac53af16a8

When investigating a failure occurring in a transaction between information processing apparatuses, it is possible to reduce the time required for the failure investigation. One or more of the sidewalls has a number of conduit knockouts, as well as a plurality of cable access ports, which allow entry of AC, MC, NM, or other cables. The differential pressure switchgauge is adaptable for producing a signal in response to a difference between the first pressure and the second pressure.

1459828187-2a3a67f1-9487-4874-b880-7a99741ab129

A method for using predictive modeling of a physical process in order to determine and implement a solution to the physical process. The device includes a charge module and a controller. The correction signals are derived from a comparison of the average value associated with the internal clock signal with a target voltage. The grommet is inserted into the grommet slot at the access location and pushed into the grommet hole. Each outer electrode salt includes an outer deforming section bulged from the axis to fit insert holes of the electrical sockets with different sizes.

1459828187-97d466da-6db5-440f-8d09-85c281400212

A punching device is provided for processing samples applied to a sample card comprising at least one punching head with a punch and a lower die, the punch being movable between a resting position and a punching position. In one aspect, an initiation mechanism also acts as a resynchronization mechanism to read the results of multi-cycle execution. Encrypted content is made available to a recipient together with a decryption code, if the identity of the recipient can be confirmed through a validation procedure and if the release conditions are met. A tracking

loop has a phase detector coupled to the sync input and the divider output for detecting a phase error between the external synchronization signal and transmit clock, and a phase control circuit for generating a phase control signal based on the phase error, the phase control signal being coupled to a control input of the controllable divider for adapting the division function. 5 weight % and less than 100 weight % and having an acid value in the range of 1103-1 and/or a chlorine ion content in the range of 1101-1103 ppm. The central control section is connected to the image analysis section, the RAM and the external memory section via a bus.

1459828188-3e469a42-fdda-4dce-acac-755c35a7d077

A waveguide photodiode includes an n-type cladding layer, an n-type light confining layer, an i-type light absorption layer, a p-type light confining layer, and a p-type cladding layer buried in an FeInP blocking layer on a semiconductor substrate. The insulator includes first and second metal layers. With the caster indicator, a user easily confirms the state of the casters, even if a medical electronic apparatus, such as the ultrasonic diagnostic apparatus or the medical bed, is located at a dark place. If there are no matches, then the BIOS may select a default performance state table or dynamically generate a performance state table. The application processor also predictively generates and offloads a session structure for the associated reverse flow.

1459828188-6c262eac-65ae-4a18-8111-12f0f60b9ffc

This document discusses, among other things, an apparatus comprising at least one implantable cardiac depolarization sensing circuit, an electrical stimulation circuit, and a pacing mode controller. The system includes a network station for compiling contact information received from wireless communication service providers. The fastening element can be supported on the wall on two supporting points, which are spaced apart in the displacement direction of the linear guide arrangement. When the user activates the correction widget, the tool displays the correction interface immediately proximal to the correction widget. The system assists with preparation of a protocol for a clinical trial; presentation of that protocol; assuring compliance with the protocol; and generating useful results from data collected via the system and externally for presentation to an approval forum. The invention thus provides a range of compositions and methods for use in treating liver injury, including those suitable for treating acetaminophen overdose outside the therapeutic window for N-acetyl-cysteine treatment, and those that limit the hepatotoxic side-effects of gene therapy regimens.

1459828188-fa20b3ce-3170-4e37-9b69-b28866f0add3

A host including a controller configured to be connected to a storage device separate from the host. The drive assembly is battery powered and includes tracks in the handle portion of its housing for receiving the battery. The feeding element and the non-feeding element have alongside-ground-terminal extending portions formed so as to be spaced from an edge surface at one end of a ground surface formed on the circuit board and to extend in a direction along the edge surface at the one end of the ground surface. Then, the CPU operates an assist motor to rotate a steering handle from a neutral position a predetermined rotational angle in one direction about the handle axis to stop the steering handle at a first judgment position and detects a first judgment torque value by the torque detection with the steering handle being stopped at the first judgment position.

1459828189-0fec2b8-0d37-47e2-bdb5-8b16a91475c9

A management server acts as a repository for a plurality of user certificates corresponding to a plurality of users. The enhanced mechanical gaming system includes a gaming machine assembly, a touch sensor assembly incorporating a substantially transparent touch panel, a touch panel controller, and touch panel software. Numerical descriptors are generated for features found in a multimedia clip, signatures are generated from these descriptors, and a reference signature database is constructed from these signatures. The inner structure of the steam

generator is designed to increase the contact of the heat with the steam generating chamber while minimizing heat exchanging tubes inside the chamber. The obtained olefin polymer has high cycloolefin conversion and a high glass transition temperature. The processor is electrically connected with each photo-detector component for transforming the electrical signal into an output signal.

1459828189-4e63858e-ab43-4e9d-9e1e-6b7188ba7b17

Sulfonyldiazomethane compounds containing a long-chain alkylcyclohexyl group are novel and useful as photoacid generators. A data broadcast transmission rate and a level of error correction to be used when broadcasting data are determined based on prior feedback received from the plurality of receiver devices. A translator board is provided having third electrical contacts arranged in the first layout on a first surface, and fourth electrical contacts arranged in the second layout on a second surface with conductive traces forming an electrical connection therebetween. The lens may be held in place by an adjustable strap.

1459828189-dc45497f-69ba-48ff-8955-d8b9486dcbee

A method and system for analyzing interlinked production processes for manufacturing a product are provided. Each of the conductor segments has a leg which includes an in-slot portion into one of slots of a stator core and a protrusive end extending outside the slot. A second material is formed over the workpiece and over the patterned first material.

1459828189-fdb9ba83-bc0a-4e8c-8985-bb9003c4c93f

In combination with an extension ladder, an L-shaped bracket is provided. The Bluetooth headset body includes a Bluetooth headset main-board and a battery. A plurality of gate electrodes are connected to the gate bus lines, and a gate insulator having a contact hole on the gate electrodes. According to the frame loss information, a second decoder performs decoding by using at least one of the following encoded information: the first encoded information on the frame immediately before, the first encoded information on the current frame, the second encoded information on the frame immediately before, and the second encoded information on the current frame. The pressure chamber may be vented to permit movement of the valve assembly toward the cover.

1459828190-595d8d1c-6af3-402c-bd4d-99c0bac04210

Apparatus and methods for resolving integer ambiguities in position determination. A first P type epitaxial layer and an interlayer insulating film are provided on the device forming portion and an N well and a P well are formed on the top surface of the first P type epitaxial layer. A continuous drive shaft extends along the length of the container and is connected to the support frame. The voltage control oscillator is coupled to the antenna to generate an oscillating signal under an interference of the electrical signal. The nozzle has a rotatable handle assembly, isolated from the fluid path, which provides easy connect and disconnect of the nozzle from the receptacle.

1459828190-e78c616d-7059-437e-afe6-73f87a2e8914

Methods and systems are disclosed for determining whether a patient is a responder to cardiac resynchronization therapy. The piezoelectric ceramic is represented by  $\text{Pb}_{0.3}\text{b}_{1.2}\text{Mea}_3\text{zTixZr}_{1.2}\text{x}_{1.2}\text{zO}_3$ , and satisfies equations 0. Use of a row-identifier to look up the corresponding block-identifier, and the storage of the block-identifier in the structure are repeatedly performed, for each of several specified pairs. Determination is made in a determining circuit 20 as to whether the output voltage  $V_0$  exceeds a current voltage  $V_1$  which is a threshold. An elastic element is at least partially surrounding the translation element and the force transfer element, wherein the elastic element provides the mechanical coupling between the translation element and the force transfer element. Thus, a resistance of the entire semiconductor layer of a TFT which is in an on state is reduced to increase an on current.

1459828191-040d5194-7d0e-463a-a1c9-979b953297fa

A wall system includes a plurality of wall members, the wall members having a first metal panel, a second metal panel, and an insulating core between the first panel and the second panel. The invention relates in particular to an injectable pharmaceutical composition comprising a pharmacologically active ingredient in a solid phase, a vehicle consisting substantially of polyol fatty acid esters with a degree of esterification of over 80%, and a wetting agent consisting substantially of polyol fatty acid esters with a monoester proportion of over 60%. An operating parameter of the control system is measured. While in motion, use of the device can be allowed under specific exception conditions. The voltage comparing circuit compares the output voltage with a reference voltage.

1459828191-6ca50d32-9790-4ad0-a663-22021680ac3c

A superconductive article is disclosed, having a substrate a buffer layer overlying the substrate, and a superconductive layer overlying the buffer layer. The matrix is preferably formed from mineralized collagen where the mineral comprises particulate calcium phosphate immobilized in the matrix and having a particle size of 5 microns or less. A product is loaded into the first bag that is held open with air.

1459828192-3790387a-1ae1-460e-839e-5118735e7d76

A method and apparatus for routing information. In one exemplary embodiment, a grasping device is provided having a shaft with an end effector having opposed jaws coupled to the shaft. Then, the additional locus for producing sharp corner can be automatically produced for the sharp corner so as to execute machining. The 1T cell with diode isolation is not limited to SiC diodes. In still another embodiment, the optical coupling material has a refractive index less than 1.

1459828192-7f5aafef-860d-4c35-afcf-f76027a21503

This application relates to novel urea glucokinase activators and use of the compounds of the invention for preparation of a medicament for the treatment of various diseases, e. The tool includes an intensity modulated pump beam for periodically exciting the sample. The controller determines whether or not the transmission target output torque is in a state in which a predetermined increase is not possible. The method for preventing airborne microorganisms from entering into a water well involves connecting the water well filter device of the present invention to an opening of the well that is otherwise sealed from open air. The first level shifter is configured to detect a voltage level of a power domain where the third control voltage operates and generate a plurality of middle voltages based on the detection result. Each of the graphene channels is separated from the substrate to have a cylindrical structure.

1459828192-9936bc67-9213-40f6-8f0a-9c92117c555d

An apparatus transfers the title of content to an ID-assigning unit which assigns an ID to the content and transmits the content ID to a broadcasting unit via a tagging unit. The FED includes micro-tips with nano-sized surface features. The untreated fluid is placed under appropriate pressure sufficient to produce turbulent flow, increased particle kinetics and/or cavitation physics allowing the desired fluid to penetrate and pass into and through the filter media. The first direction is perpendicular to the second direction. In another possible application of this method, sufficient bottom anti-reflective coating may be removed to only partially fill the vias in order to protect the bottoms of the vias during subsequent processing. These IGF agonist compounds, which include peptides, are useful to increase serum and tissue levels of active IGFs in a mammal.

1459828192-cd995bcb-3188-40f5-8bad-40cf1012a8f3

A serial fan includes a frame, a plurality of rotor vanes, a support connected to the frame through a plurality of connecting parts. The multi-stage separator is

preferably composed of cyclone separators, with the diplegs of at least two of the cyclone separator stages merged together. If there is an exterior driver, then it is determined whether there is a booting up module in the exterior driver. Additionally, a sequential paging technique is described herein, wherein PS paging signals are delivered to VoIP-capable access points and, if no response is received from a desired terminal, CS-domain paging is conducted.

1459828193-4ee4c136-d383-4d6f-9a75-7a0e9a7bcc1e

A valve metal electromagnetic interference filter. For example, one method involves executing operations of a first task. The image forming section includes a first electrode and a second electrode that contact the peripheral edge of the toner discharging port and the seal member, respectively, when the toner cartridge is loaded into the image forming section. Method embodiments are also disclosed.

1459828193-5f8d50f4-1ebe-4dfb-aef7-6aee1844a147

A display device capable of early finding a sign such as misregistration or width variation of an emission layer formed by a layer transfer method, and a manufacturing method of the same are provided. A motion sensor detects a predetermined optimal position of the lead knee and a positive feedback alert is produced when the predetermined optimal position is achieved. An IR reflection layer, an IR absorption layer or an isolation layer is disposed between the photosensing element and the RDL.

1459828193-7db9b821-8f45-466f-9edb-af057fe8462b

The invention is therapeutic methods and compositions that alter the immunogenicity of the host. The forehead cushion includes a contact portion having a contact surface adapted to contact a user's forehead and a connecting structure structured to couple the forehead cushion to the forehead support and allow pivoting and/or tilting movement of the contact portion relative to the forehead support. A first field effect transistor is placed in series with the multi-track inductor that is to be compensated, and a second field effect transistor is placed in series with the dummy inductor, where the gates of the FETs are tied together. The memory management unit can enable either the first translation or the second translation to be used in response to a processor address to enable data to be written simultaneously to different memories or parts of a memory.

1459828193-e7b27246-99f6-4960-806c-89270719717a

A system for managing storage space on an electronic storage medium is provided in which a file format for stored data allows for progressive deletion of low-significance data, for example in a video or audio file, while allowing the remaining portions of the file to be subsequently retrieved. The pharmaceutical formulation comprises decitabine solvated in a non-aqueous solvent that comprises glycerin, propylene glycol, polyethylene glycol, or combinations. This provides a control device for suppressing deterioration in acceleration performance of the vehicle in a case of slipping of engine-driven wheels during acceleration. Information is stored in the memory cell by creating a second amorphous material region inside the active crystalline material region. Since the first and the second electrode layers are formed separately, it is not necessary to perform mask alignment twice, and hence an overlap structure can be precisely formed in which the thickness of the second electrode layer at the left side is equivalent to that at the right side.

1459828194-4e2aa708-d9f4-46f8-9261-3aac68e45220

A high-efficiency multiple-pass nonlinear wavelength converter and amplitude modulator employs a variable dispersion element between adjacent passes of a nonlinear wavelength conversion process in a single nonlinear optical material substrate. A multiple channel optical interconnect uses a linear array of optoelectronic devices and corresponding optically transmissive penetrators. 8 \u03bcm, an organic medium and a dispersant, the dispersant being the reaction

product of a polyethyleneimine with a homo- or co-polyester based on lactic acid, and method for decorating green or fired ceramic bodies by the use of the above ceramic inkjet inks.

1459828194-dddea481-8f64-41bb-b753-d11c038ff98b

This invention provides system and methods for managing accounts of clients at customer financial entities so that deposits of up to \$100,000 or greater are insured, so that interest income earned on a portion of all of the account balances may be flexibly allocated according to customer instructions, and so that withdrawals are not limited. The messaging application user interface can be implemented so as to maintain a subset of the plurality of potential message recipients, the subset being determined using a predetermined criterion. In low-speed data transmission, on the other hand, the HL transmission switch circuit outputs a selection signal for inputting a control signal to the main buffer in accordance with the low-speed data to the selection circuit. and pressures as high as 500 psi.

1459828194-eb7ac204-4c51-4704-a223-b4fc8710e303

The present application provides a dispensing package for a number of articles therein. The electrically-conductive material and the electrically-insulative material are applied one layer upon another in an alternating manner to the actuator block in at least one actuator finger location. The sheet of package wrap has the package wrap pattern and can have fold markings corresponding to corners of the package.

1459828194-fd3e3b87-b8ab-4a35-983d-418516a61e24

A shock absorber for a vehicle having a damper and a first and second springs mounted coaxially around the damper and a preload adjuster for partially compressing at least one of the springs independently of the compression stroke. The lead frame connectors include a conductive lead structure that is encased in an insert injection molded plastic casing. A second control unit provides telecom functions, such as speech coderdecoder or echo extinguisher, to the connection.

1459828195-0f530bae-8ce7-416f-b195-792caf73ccb6

A portable beverage delivery system for preparing and delivering a multi-component beverage whose plurality of individual components can be maintained separately for subsequent combination to form the beverage. Lights, lighting fixtures, and other similar fixtures are connected in such a way as to enable them and/or the dimensions of the system to be remotely controlled. A second type doped diffusion region is formed in parts of the first type semiconductor substrate. The candidate delivery event may be a location and/or direction change, device state change, or movement exceeding a movement tolerance. Each reference measure is representative of at least one of measured and derived patient information. Each block defines an inmost second support wall.

1459828195-b2a37c27-0807-4299-86bf-f4792a2e37f1

A non-vented shell earplug for insertion into the ear canal has multiple chambers configured as coupled acoustic resonators. According to the main characteristic of the invention, the contactless portable object includes a set of field indicators that provide the user with a measurement of the value of a physical quantity proportional to the quantity of the electromagnetic field which passes through the antenna. The target air-fuel ratio of the engine is limited by an upper limiter and lower limiter so that the high speed component converges to the target value, an excessively large variation of the air-fuel ratio is prevented, and impairment of drivability and fuel cost-performance is also prevented. The circular gear is rotated as the adjustable part is moved.

1459828195-f156c5a8-bbd3-4b26-894c-34815d6003e9

A method of forming metal castings, including positioning a first end of a

structural member in a first mold cavity and a second end of the structural member in a second mold cavity. The present invention uses a divide-only direct digital synthesizer and a fixed local oscillator. Demand may be based upon user activity such as click-throughs, purchases, price, or location. The insulating layer and a gate insulating layer of the second transistor satisfy the following formula:  
$$\frac{W}{L} < 0$$
Advantageously, the customer may be given one or more options for the delivery of the content.

1459828195-f481d736-3e69-4534-98fc-2cbf138cd6ec

The current invention provides a method of improving the efficiency of one or more heat exchangers used in cooperation with a high temperature solution polymerization process. A content distribution management server determines by which distribution method to send the content key and content use conditions of each content according to an attribute of the content. The metal conductor may have a density lower than a density of the silicon carbide beam. The thinned bonded structure may be loaded into a processing chamber and electrostatically chucked employing the blanket conductive film or the mesh of conductive wires.

1459828196-148905ca-a8a6-4637-86a9-a9324a5093a5

For improved temperature-dependent correction, a method is provided for compiling a temperature-adjusted correction image for the electronic correction of a raw X-ray image recorded by an X-ray detector at a recording temperature. The gas filter includes a pleated filter pack, a spacer arrangement which includes solidified bonding material between adjacent pleat legs on the upstream surface of the filter pack, and insert spacers between adjacent pleat legs on the downstream surface of the filter pack. The member is movable between the first and second portions in a direction non-parallel to a direction of passage of the member through the opening. Then the measurement signal is derived from the current that develops from the measurement time in a connection of the star point to the specified potential.

1459828196-5fecdf1b-5873-4c28-90e6-4f852c60db14

The invention provides compositions and methods for inhibiting Chk1 and/or Chk2 kinases. A first semiconductor area to which a ground level for the buffer circuit is supplied and a second semiconductor area to which a ground level for the logic circuit is supplied are electrically separated from each other. The visible imaging system captures a visible image of tissue. The document includes data to be used by the client in generating a display. The sheath is impervious to bacteria and viruses. The veil has a spreading shape to simulate a root flare of a tree.

1459828196-88ceeff8-3961-4020-bbb8-c56c4298a5e5

The electronic apparatus includes a portable electronic device and a charger for capacitively charging the portable electronic device when the portable electronic device is temporarily placed adjacent the charger. The aerosol solvent cement product includes an aerosol solvent cement composition disposed in a container. A plurality of illumination units each includes a respective cable and a light generator at a distal end of the cable. The vents on the bag allow the use to blow the debris into the bag without the debris being blown back out of bag by the force of the air column.

1459828196-b4736314-de9d-4d3b-aa13-197a1a5fca49

Whether medical image data is provided with photographing information representing the object part and/or the direction of taking the image is judged, and the object part and/or the direction of taking the image of the medical image data is recognized on the basis of the medical image data when the image data is not provided with photographing information. It is then determined whether a connection to a backup server is available. A service session between a first access network and the mobile station is established.

1459828196-c45f35c2-66a9-4926-bed2-20cb08d7ab7f

A stand-on swing for suspension from a playset structure includes a platform member presenting an upper surface on which the user may stand. In one embodiment, a MEMS device includes a first semiconductive material and at least one trench disposed in the first semiconductive material, the at least one trench having a sidewall. In the preferred embodiment, an opening is formed through which to view the object, and recorded information is expressed on, in or included with the device so that the user can correlate the position of the object image to predetermined distance information. The sorting component matches the collected real-time chat messages from the LISA tool with correlating submitted survey queries to provide raw real-time survey results which are converted into a viewable format for submission to the surveyor. The target has a metal plate that moves backward and upward on a pivot point when the shot is within the standard scoring pattern, and then moves forward and downward to reset for the next shot. The check processing system is operable to receive the process buffer from the emulator through the communication engine.

1459828197-28c13a39-c132-4395-97b6-b338fd7e6c1a

An implementation of a technology is described herein for recognizing the perceptual similarity of the content of digital goods. The invention utilizes a classifier for categorizing and weighing risk, composed of data representing in an identified building, a first unmitigated insurance risk and a second insurance risk, based upon the use of certain technology. A pacing signal is generated including a first signal component, a second signal component and a reference component with the first and second signal components having opposite polarity and with both of the first and second components having a potential relative to the reference component. Sound can be provided as required to complete the illusion. The thus obtained filler is draped into a web of wrapping material to form a cigarette rod ready to be subdivided into sections of unit or multiple unit length.

1459828197-372c72aa-f68a-4b85-bdc5-025df2e0b072

A new and distinct cultivar of Grevillea, named Grevillea sp. The BLSRM includes a stator provided with windings, a rotor rotating about an axis when current is conducted to the windings. The method can also include removing impurities from the pier's surface; arraying a plurality of reinforcing steel bars around the pier; laying stones outside the arrayed steel bars while fixing the stones to the steel bars or the pier, and filling the gap between the pier and the stones with concrete. The deck extends along an inclined plane to maximize downward force of air current applied to the deck to reduce wind lift.

1459828197-3b914096-b5a8-41ff-9415-da91f4710d80

A method for purifying N--2-pyrrolidone is disclosed. Also, a mask layer is formed on a substrate, then an AlN layer is formed to cover it, and then the AlN layer is lifted off by using a solution for etching. The soft tissue attachment component is moveable with respect to the prosthesis while connected thereto. Two more community cards are revealed and the winning hand is determined where each hand is a combination of the first two cards and the five community cards.

1459828198-338324de-7010-42d4-9b03-34fc93818e2f

A drill guide apparatus for aligning a cervical drill bit and a target site in a vertebral body prior to drilling a hole in the vertebral body is disclosed. A C-shaped positioning ring is securely engaged with a groove defined in an inside of the two jaws of the head so that only the engaging member is rotatable relative to the head. The character recognition unit performs character recognition on the still image identified by the identifying unit. Because of this narrow slot, the pinch zone resists movement of the tube from either the occluding or the flow sections into another section.

1459828198-51f13833-b3da-4c18-b8aa-4f655ef52244

An apparatus for supplying optimal data for a hierarchical motion estimator, and a

method thereof are provided. According to the invention, a base station outputs a digital IQ signal to an optical connecting unit. Therefore, it is possible to minimize a temperature distribution in the process chamber and uniformly supply heat to the entire region of the plurality of substrates. Furthermore it could be inferred that there is a strong relationship between different documents clicked by the user.

1459828198-914e33b4-c530-4727-9a59-a7e82f118405

A golf club head has tee handling and ball retrieval included therein. The board includes a front surface, a rear surface, a left side and a right side. The method delivers e-mail messages to the targeted e-mail addresses, the e-mail messages comprising an HTTP request and a unique identifier associated with each of the user accounts. % of an impact modifier; from 1 to less than 25 wt. This variety is distinguished from other peach varieties by its unique combination of non showy flowers, large fruit that ripen in early-season, with an attractive red over color, clingstone fruit with a juicy, but firm melting texture and sweet, low acidic flavor, and excellent production of firm fruit that maintain their eating quality following cold storage. The reflective layer is disposed on the passivation layer.

1459828199-17a6adeb-5051-40e1-824a-33060c9b0c3f

A new and distinct *Salvia* cultivar named 'FLAMMEN' is disclosed, characterized by a long inflorescence, large individual flower size and early flowering. A portion of the apparatus supports the process monitoring assembly to establish a line-of-sight propagation path of monitoring beams from above the dome, through the window to the substrate to facilitate etch depth measurement without encountering interference from high power energy sources proximate the chamber. The push sleeve is disposed in the inner bore of the tubular body and coupled to each of the one or more blades so as effect axial movement thereof along the track to an extended position responsive to exposure to a force or pressure of drilling fluid in the flow path of the inner bore. A buried layer having the first conductivity type is formed below the second lightly doped region and electrically connected to the first lightly doped region. In yet another aspect the present inventions are directed to techniques and/or circuitry to calculate data which is representative of an overpotential of the battery cell.

1459828199-de0f892f-38bc-42db-be8a-8e1dcfe4517e

An uplink synchronization processing method, a User Equipment, and a base station are provided. The state variable is determined by a transfer function which is determined by evaluating the measured oscillations and evaluating measured data of the electric sensor. Each of the fasteners comprises a support bracket for attachment to the support structure of the aircraft and a guide assembly for supporting the spray tube to the support bracket. A first heating coil and a second heating coil can extend between the screen and a first cone and a second cone, respectively. According to the invention, controllable safety means act along said passage are provided, which normally operate for preventing washing agent downflow from said tank to said passage, independently from the position or state of the first plugging means.

1459828200-3843f05f-816e-412f-bf08-c8336417ce1b

An adaptive sigma-delta modulation and demodulation technique, wherein a quantizer step-size is adapted based on estimates of an input signal to the quantizer, rather than on estimates of an input signal to the modulator. A vehicle limitation control signal is supplied to the vehicle over a wireless communication network. The material of the polymer may be polyimide. The UEs extract the data and control information from the two time slots and acquire the data and control information destined for the individual UEs.

1459828200-869ecf03-2575-4545-9b02-5e3337a4c524

An aluminum-magnesium alloy for casting operations consisting of, in weight

percent, Mg 2. A preferred embodiment includes a lens cartridge including a lens holding portion connected to a nozzle portion. Prior to storage, some of the data frames are eliminated, or dropped, and are not stored in the queue.

1459828200-9fd51973-bc7d-49b8-a11b-e5a5042514dc

A hybrid fibercoax network is provided. An example method involves receiving image data and first timing information associated with the image data, and receiving sensor data and second timing information associated with the sensor data. These databases can include messaging data, such as email address books, mailboxes, etc. Finally, the invention provides fun outdoor exercise, therapy, or training, with substantively enhanced ambulatory capacity and substantively reduced internal and external impact to the body in all human gaits and to all users able and, importantly, disabled.

1459828200-dff467a5-5064-4a86-83c7-1917812f7254

A mobile communications control method of this invention controls mobile communication by a mobile terminal in a network in which a plurality of wireless systems are available. The device generates usage information including the times that the device is used, types of functionality provided, indication of amount and type of resources used, and other information. The particles created by this approach can be much smaller, and dental prostheses sintered from this powder can be stronger and more realistic. The method described herein thereby permits the creation of all implied markets that are inherent in the combination of futures, calendar spread and inter-commodity spread real orders. Current information may be used when choosing and/or ordering ads.

1459828201-345c03bb-e2d8-4225-ae33-7f0dc4de075b

A method and a Network Element for manifesting alarms by forming a so called combined Data Quality Byte for a particular SDHSONET data transmission stream. A method for sealing the organic EL display panel includes the steps of forming a buffer layer of an organic matter such as silicon oxide and silicon nitride on the transparent panel, and locating a shield cover on the buffer layer. The at least one burner probe may include a wave guide. When one frame has been completed the decoded result is output by backtracing. The strain may be sensed for the optical fiber in a known, predefined bend shape.

1459828201-6ddf215b-0bf0-4545-9d76-767852b225ee

A customer service application resident on a user's portable electronic device is used to get information about a service and also request the service offered by a store. The sensor includes the following from measuring light input side in the order listed below: a first reflector having semi-transmissive and semi-reflective properties; a translucent body ; and a second reflector having perfect reflection properties, or semi-transmissive and semi-reflective properties. Methods for producing a maize plant containing in its genetic material one or more traits introgressed into PHEJW through backcross conversion and/or transformation, and to the maize seed, plant and plant part produced thereby. A deflection device may be used to direct a drift of the drifting apparatus into a selected one of the wellbore junction legs. The invention also pertains to a system and method for implementing the matching device. In one preferred embodiment will the transmitting party provide information regarding which timeslot hat are not used.

1459828201-bee3740a-3721-4e8b-9430-fdc7b88dffe2

An apparatus for making hydrogen storage powder by hydride comminution which includes a hydride reactor with at least one chamber for tumbling powder. The chamber includes a float member formed of an inert material and contains, in use, a fluid intended for inhalation. The platform control hub is woken up according to the boot signal. After formation of the recess, a carbon implantation is selectively performed to form a carbon implantation region within the semiconductor substrate at a position underlying the recess.

1459828202-308d19e0-62f5-4c93-b7b8-dea246806ce3

In a lubricating device for a plurality of lubricating stations, in particular for supplying lubricant to knitting machines, a pump device is provided that serves at the same time as a distributor device. The method and apparatus allows for alignment of the template on the fabric article while hooping only the embroidery backer. The access devices include vertical semiconductor material mesas upstanding from a semiconductor base that form a conductive channel between first and second doped regions, and also planar access devices. The main composition is expressed by the general formula. In some implementations, multiple output triangles within the input triangle are generated simultaneously by parallel processing.

1459828202-b251954d-fba6-4cb6-81cb-a1630d5473ef

The present invention includes a system for servicing messages between device controller nodes and control applications via a Lon Network, wherein the device controller nodes includes a plurality of network variables for defining parameters of the Lon Network. More particularly it is concerned with improving compositions which due to the presence of an efflorescent component may be unstable and prone to decomposition and/or spoilage. In a second embodiment, at least one hydrocyclone is used as a thickener of insoluble residue mud. The seat assembly is positionable between a plurality of upright and flat bed positions.

1459828202-ea284eb9-6f96-4379-8093-ac3e54d57103

An interactive method for radiation treatment planning is disclosed. The upper edges of the rollers are aligned to define the surface of the path. When the MAL is positionally rotatable to the CLOSED position the first connector housing and the second connector housing are mated together such that the locking means is disposed adjacent an external surface of the second connector housing. A dorsal portion of the panel extends from the aperture to the first end of the panel. 1% by mass, and the half-value width of a plane in X-ray diffraction is not more than 1.

1459828203-28146023-4c6c-445f-9afe-1f91ece61158

The invention relates to an evaporator control by use of an expansion valve and an internal heat exchanger IHE. A first oscillator generates a reference clock signal having a frequency depending on a control signal. A maximum period between measurements may be imposed to reduce irrelevant results, as may a minimum period. The incorporation of a screw into the warming or cooling device allows the temperature of the solution to change while simultaneous mixing and shear is provided.

1459828203-c6e83bd4-a117-4ab5-91ae-d94a77fbb84b

A method and a system for extending distributed logon services to an off-line computing device includes encrypting, on the off-line computing device, a one-time password, a nonce, and a unique identifier to generate an authorization request message. The first gate insulating film includes a first high dielectric constant insulating film with a first nitrogen concentration and the second gate insulating film includes a second high dielectric constant insulating film with a second nitrogen concentration higher than the first nitrogen concentration. A phase detector determines whether the edge and data clock signals are in phase with the incoming data, while some clock recovery circuitry adjusts the edge and data clock signals as required to match their phases to the incoming data. A control circuit synchronizes the operation of the several D.

1459828203-d74c2367-e451-4efc-916f-daf86e5908de

A plastic frame and a frame are provided in a screw-on structure. A node has dynamic coherency boundaries such that the hardware uses only a subset of the total processors for a single workload at any specific point in time and can optimize cache coherency as the supervisor software or firmware expands and contracts the number of processors used to run any single workload. The treatment method is

particularly appropriate for bedsores. Upon receiving the profile, selectively offering services to one or more access terminals based at least in part on the profile. The second device notifies the first device of a second feature value based upon the detection result of the second acceleration sensor.

1459828204-32cf75cb-0278-4bcb-a615-616499457542

An intravascular stent assembly for implantation in a body vessel, such as a coronary artery, includes undulating circumferential rings having peaks on the proximal end and valleys on the distal end. A viscoelastic pad is used to support and hold a patient on a medical procedure table during a medical procedure performed while the table, and thus the patient lying thereon, is in an inclined position, such as the Trendelenburg position. The retractable guide tube assembly includes an arcuate guide tube having a first portion that is slidingly positioned in an arcuate portion of the housing. There is also, for the number of simultaneous calls, at least one second upper limit which is not lower than zero. The microgranules consist of a neutral granular carrier coated with an active layer including diltiazem or a pharmaceutically acceptable salt thereof as the active principle, a surfactant and a binder, and an outer layer providing sustained release of the active principle. An improved image analyzer includes a computational unit configured to execute this method.

1459828204-417222bc-54cc-46db-be30-87d1c470f540

The invention provides a method of extruding dental material from a capsule-like cartridge, by providing a capsule-like cartridge having an elongated body and a nozzle. The surge absorbing circuit includes at least one surge suppression circuit, the at least one surge suppression circuit including, with respect to the same signal line at least: a power supply; a diode connected between the signal line and the power supply; and a power supply line for connecting the diode and the power supply to each other. The distal opening of the second guidewire lumen abuts the proximal end of the bifurcation. The first clamp section includes a downwardly open hook portion that is positionable over a catch member of a footman loop mounted to the main body of the windshield frame. The invention further relates to a method for the production of said insulin analogs and to their use, particularly in pharmaceutical preparations for therapy of type I and type II diabetes mellitus. It is endeavoured to provide a simple way of extending the functionality of such lifting devices.

1459828204-7ac8b320-241e-43c1-b1ae-378566d7ab29

The present invention is a method and apparatus for a very low profile ball grid array package. The toner charging roller has a metallic layer which induces its electrons by receiving light irradiation, and an ultraviolet irradiator which irradiates ultraviolet to the metallic layer. The target waveguide has an entrance at the back side and directs energy provided by a laser from the entrance at the back side toward the ABS. The plurality of analytes are simultaneously analyzed by collecting and recording images of the optical signals generated by all the microparticles in the planar array. The RE middleboxes may be scaled for use with cloud applications. The variable angle screen being configured: to blend output at all of the various operating angles of inclination, be transportable with a detachable bolt on feeder module; have an overhead feed conveyor which operates at a substantially horizontal configuration and at various operating angles of inclination.

1459828204-810b8594-0912-46ca-a7e3-57511913482a

A telescopic shaft for steering of a vehicle is assembled in a steering shaft and includes a male shaft and a female shaft that are so fitted as not to be rotatable but to be slidable. The protrusions are brought into contact with a surface of positive photoresist, and the surface exposed to electromagnetic radiation through the phase mask. The primary windings are wound to produce voltage amplification and connected to an ignition circuit adapted to produce high-voltage ignition spikes to

turn on the discharge lamp.

1459828204-bcf7efae-88bd-4d71-a9b3-b1194a68dc58

The present invention generates a task-dependent acoustic model from a supervised task-independent corpus and further adapted it with an unsupervised task dependent corpus. The reactor produces a liquid crystalline polymer capable of forming an anisotropic melt phase. The flank portions present exposed surfaces that are steam tempered.

1459828205-3779ede8-69ec-4054-91d0-fdb066f80eb9

Various lighting devices and related methods are provided. The system includes a server rack and a contamination filter secured to the server rack. The wireless interface can relay diagnostic information from a vehicle to the diagnostic device when the wireless interface is coupled to a diagnostic cable, which is connected to a vehicle. The device may have means for adjusting the tension of the target material.

1459828205-9c8b077b-adbb-402b-8fb7-2604543471ad

A ratcheted lashing strap assembly is described. The system also includes an energy-absorbing lanyard contained within a cover and connected on opposing ends to a pair of non-conductive self-closing and self-locking hooks. The weighing electronics has a second plug and contact arrangement that mates with the first plug and contact arrangement when the scale module is plugged into the cavity.

1459828205-b2c6ce03-9d19-44fc-af0e-e3f368c5b58e

An automatically movable storage apparatus for retaining a ladder on top of an emergency vehicle and facilitating movement thereof to a deployed position extending downwardly and rearwardly therefrom selectively to make the ladder available for usage. Conventional memory-space dependent instructions, such as MOV, MOVX, and MOVC, provide an optimized addressing scheme, and an extended memory-space independent instruction EMOV provides an optimized code efficiency, processing speed, and ease of code generation. The digitized ambient component is subtracted from the digitized illuminated component to generate a light signal with a reduced noise component. The method of the present invention serves as a supplement to or a replacement for conventional hysterectomy or ablationresection procedures used to treat menorrhagia. A gradation is calculated for generating a video signal such that, at two pixel formation portions arranged at intersections of these two scanning signal lines driven at the same time and a video signal line, a luminance averaged from luminances originally to be appeared at the two pixel formation portions appears. The regulators are contained within a ventilated cabinet and the hoses are wound about a reel.

1459828206-2a0c2ae9-4179-46b4-ab7a-1ff53059dfda

A magneto-optical recording medium includes a first magnetic layer, a second magnetic layer, a third magnetic layer, and a fourth magnetic layer having respective Curie temperatures TC1, TC2, TC3 and TC4. The data storage device includes a recording medium having a dedicated servo layer for providing servo information. The data acquisition system may also have a controller in communication with the first and second sensors.

1459828206-3af0450d-b07a-4765-bc96-44dd918f65c1

A dishwasher includes a cabinet having arranged therein a central cavity. Examples of such properties include enhanced recombinogenicity, genome copy number, and capacity for expression and/or secretion of proteins and secondary metabolites. The first group of optical elements enables high numerical aperture and beam contraction. The rotor assembly is operatively connected to the output shaft and responsive to electromagnetic flux generated by the stator so as to provide a rotational force to the output shaft to drive the windshield wiper in repeated wiping motion across the windshield. In an embodiment, the mask may comprise one or

more replaceable non-stick stencil elements and associated springs to press the stencil elements against the substrate. The composition wherein talc has a median particle size of less than 1000 nm further contains a polycarbonate and/or polyester-carbonate, and a graft polymer having as graft base a rubber having a glass transition temperature of below about 10°C.

1459828206-9d08486c-716e-439c-a336-e19a9b668d25

A heat sink for use with a high output LED light source is disclosed. The methods involve adsorbing the analytes to a substrate under a plurality of different selectivity conditions, and detecting the analytes retained on the substrate by desorption spectrometry. In one embodiment, a plurality of candidate locations of header checksum windows are searched and checked for a valid checksum.

1459828206-ef3c5ddc-79ce-43d6-9b9f-9a96bd42b8f9

A laser spray method exhibiting a high detection sensitivity when applied to mass analysis has its sensitivity raised further. The electrode current collector is made of copper or a copper alloy, and has a front surface color and a back surface color, at least one color of which is a color belonging to a color space represented by:  $50L^* \leq L^* \leq 50$ ,  $5a^* \leq a^* \leq 50$ ,  $5b^* \leq b^* \leq 50$ , where  $L^*$ ,  $a^*$ , and  $b^*$  are numeric values determined based on the  $L^*a^*b^*$  calorimetric system described in JIS Z 8729. The force of the paper moving along the transportation path swings the shutter arm unit into the second position, a protrusion cam and an escape cam prevent an increase in the return load of the shutter arm, and a pair of ends of the shutter arm aligns the front end of the sheet of paper. By using UV-oxidation as the first step in either a 4-step or 3-step gate stack process, very thin composite dielectric films with equivalent oxide thickness below 16 and as low as 14.

1459828207-3ca6e7f6-b229-4b65-a5b9-426d606a3044

Information is recorded on or reproduced from an optical recording medium with irradiation of light from the opposite side of a substrate. The bridge section forms at least one of an angle and an arch. In embodiments, the single roller is used to clean a plurality of ejectors, in which case each section of the roller handles one ejector. The resulting airbag cushion assembly may be configured to separate the wraps sequentially, rather than simultaneously, during inflation of the airbag cushion. This product membrane is useful in the separation of C3 and higher hydrocarbons, as well as CO<sub>2</sub>, from natural gas and other gas streams.

1459828207-5799a6f3-f23f-4ce4-9bb3-a3fc7b56da7a

A Class-D amplifier includes a pre-amplifier having an input configured to receive an amplifier reference voltage signal which is ramped at start-up at a fast rate. The garment is positioned either on one vacuum conveyor or between an upper vacuum conveyor and a lower vacuum conveyor. Moreover, the present invention provides a MAC channel structure for delivering control information via MAC channel.

1459828207-83f5976e-7ce9-4fb3-b962-52fefb512827

Sensor arrangement having row and column lines arranged in first and second directions, respectively, sensor arrays arranged in crossover regions of the row and column lines, a detector, and a decoding device. For example, a search may take into account one or more network addresses to focus a search for particular content. The parallel data may then be processed to for example generate statistics to monitor link integrity, prior to being transmitted.

1459828207-8aaf099f-6624-43e7-98e8-46080befb00a

The system is a rebate program for the benefit of participating individuals such as wage earners. The system includes a computer, a transducer probe, and a receiver. Two rows of contacts are held in an upper contact area.

1459828208-a03cea99-a44b-4278-b760-532b82a363a1

A vacuum pump comprises a molecular drag pumping mechanism and a regenerative pumping mechanism. Each participant calls from a separate telephone device that communicates with a base transceiver station that is coupled to a distributed mobile architecture server. The duplex exchanger includes a first heat exchanger having a first main flow channel, and a counterheat channel joined in flow communication therewith. Next, the system performs an interval optimization process to compute guaranteed bounds on a Pareto front for the objective functions, wherein for each point on the Pareto front, an improvement in one objective function cannot be made without adversely affecting at least one other objective function.

1459828208-f178db1c-e955-4434-89fa-43f933c4a992

A grinder disc, insert holder and insert assembly including a grinder disc with a plurality of grinder insert holders for grinder inserts for grinding and the like. The rivet is provided with a projection at one end and with spreadable expansion elements at its other end. Light is irradiated from a first substrate side, and reflected light is subjected to spectroscopy. These compounds are useful, inter alia, in the treatment or prevention of acute and/or chronic neurological disorders such as psychosis, epilepsy, schizophrenia, Alzheimer's disease, cognitive disorders and memory deficit disorders, as well as chronic and acute pain. In one embodiment, there are two delayed release dosage forms, as well as a delayed sustained release dosage form, with each of the dosage forms having a different release profile, wherein each reaches a C<sub>max</sub> at different times. A semiconductor device is provided having a low parasitic resistance of sourcedrain regions and a desired threshold voltage hard to be lowered.

1459828209-33d32f5a-3977-4f12-8ebc-39aef5761ca8

The invention relates to a compounder comprising a mixing unit, which can be mechanically driven by a drive module and is provided with one or more feed devices for the material to be processed and one or more additives that are to be mixed with this material. Alternatively, the same bitloading may be applied to several or all of the subsets of an MC group. A liquid crystal array is disposed in either the reflected or transmitted beam. The switch controller controls the states of the switches in response to control information representative of the source and the destination of each bus transaction. COMs include messages that are automatically sent based on a delivery. The online game can be virtual world representative of at least two of a northern continent, a western continent, a southern continent, a central continent, and an eastern continent.

1459828210-20382758-1f73-4632-954b-3819407aa810

Manageability tools are provided for allowing an administrator to have better control over switches in a lossless network of switches. The safety cover may include a cover with a front face where the front face is configured to cover the face of an electrical device except for a plurality of plug blade apertures therethrough. When a first voltage of a first polarity is applied to the first input and a second voltage of the same magnitude as that of the first voltage but of opposite polarity is applied to the second input, a virtual ground is established in the structure near its center of the segment. The maximum waiting time is a time that must elapse before the navigation device can again transmit the reroute calculation condition. The exterior panel is preferably metal and is hinged to the housing for movement between closed and opened positions. The collector, the gate electrode, and the plurality of transparent electrodes are disposed between the first substrate and the second substrate, wherein the collector and the gate electrode are disposed in the device region and the transparent electrodes are disposed in the display region.

1459828211-092d497b-e0fa-4c24-b93f-ccb7f6d706e6

A method is for reducing booting time of a mobile communication terminal. The pair of movable arms extend from the base for catching a head slider with at least one head element in a space between the pair of movable arms. Also disclosed are a

design method and structure for a random number generator, which incorporates multiple pairs of essentially identical transistors having such a large  $V_t$  variation and which relies on  $V_t$  mismatch in pairs of those the transistors to generate a multi-bit output. The second film has an elastic modulus higher than that of the first film. The weld detect circuit receives the output of the sensing circuit, and enables a dark state drive signal to be delivered to the shutter assembly. An embodiment of the present invention may provide a speed adjustable booster turbine to energize a variable speed booster; which provides air at a relatively constant pressure to an air processing unit.

1459828211-29ac568f-6507-4122-8aeb-724a5d5fdf35

Stabilized dispersions are provided for the delivery of a bioactive agent to the respiratory tract of a patient. The dynamic sealing lip is provided for establishing compressed sealing engagement with a relatively rotatable surface, and for wedging a film of lubricating fluid into the interface between the dynamic sealing lip and the relatively rotatable surface in response to relative rotation that may occur in the clockwise or the counter-clockwise direction. A handwritten input is received in the handwriting area. Accordingly, the plate is in double contact with the inside and the outside of the top case, so that the plate can be in contact with the top case in spite of a movement of the top case. Additive manufacturing technology and statistically controlled advanced manufacturing processes quickly produce personalized medical devices worldwide. As a result, the pressure compensator assembly compresses the lubricant disposed within the sealed lubricant chamber and, accordingly, functions to maintain a positive pressure situation within the lubricant chamber.

1459828211-64a881a0-9304-42fb-893f-c1e5a20babfa

Provided are an electrode additive coated with a coating material made of electrically conductive materials such as metal hydroxides, metal oxides or metal carbonates, and an electrode and a lithium secondary battery comprising the same. The structure comprises a frame having a base and a stanchion connected to the base. A light guide sheet with a plurality of convex-concave light emitting portions is formed on an optically transparent substrate, which is disposed between the touch panel and the movable contact.

1459828211-9b0dcfba-b985-44bf-8f29-4d83d1fddfaa

The present invention provides for inexpensive transparent microwave antennas with high efficiency. It thus includes a compressor with one, two, or four stages based on a modular architecture with common components. The cutter translation mechanism comprises a lead screw with discretely formed threads and a rotatable pawl. A translator device converts a first SCSI-based communication message to a corresponding first non-SCSI communication message that is recognizable by the non-SCSI device. The piperidine derivatives exhibit antitumor activity and are useful as pharmaceuticals such as an antitumor agent.

1459828212-024e5aa1-2fd8-4d68-a23b-1dab5ad2a79e

In one embodiment, a memory controller may be configured to transmit two or more critical words corresponding to two or more different read requests prior to returning the remaining beats of the read requests. The system receives input image data at an input frame rate and/or input resolution. The tensioner also may have a fluid filled chamber inside a portion of the drum section of the arm and a valve pivotally attached to the tensioner so that the valve extends across the fluid containing chamber.

1459828212-055a9ac1-9f2a-4439-9aac-9c2e308eee9d

In a method of fabricating a liquid crystal display, an insulating layer for storage capacitors is reduced in thickness to increase the storage capacity while maintaining the aperture ratio in a stable manner. Channel acquisition is first attempted at no offset from a start frequency that is obtained by fitting an ideal

temperaturefrequency error curve to available actual data points. The stimulation lead adapter can also include an adapter plug configured to electrically engage a stimulation lead port of an implantable medical device.

1459828212-19627505-2e5a-41f1-bbca-09b0c9601360

A substrate holder is reliably transported in a state of holding a substrate. A mask generator outputs a threshold value for each pixel of a display. The outward angled tine extends from the body to a housing engagement surface and is configured to engage a portion of a housing.

1459828212-807f15dd-bd72-49e3-aeb9-70d4be6f0cea

A steering wheel has a rim with an armature substantially encapsulated by foam. A first side wall 425 constituting the casing 420 includes a first side wall part 425a and a second side wall part 425b aligned sequentially from a first end wall 423-side in a first direction from a first end wall 423 toward a second end wall 424. In addition, the inhibitor containing the retinoic acid can be used for a cosmetic purpose and as a prophylactic or therapeutic agent for wound-caused dermatitis and ski senescence.

1459828212-f34a3192-aa49-4d78-8afc-f56d6e810d2e

Disclosed herein is a catalyst for aqueous-phase reforming of biomass-derived polyols, which comprises platinum and copper as active metals and a mixture of magnesia and alumina as a support. One or more openings are provided in a die carrier which are filled with a material which is more resistant to compressive forces than the carrier. The social media data is received from one more social media platforms.

1459828213-4f6d94cc-52c6-4dff-9189-b40aaca9db7f

The surface of a transparent layer provided on the uppermost layer of the label side of an optical disk is subjected to pearskin finish. The radar level gauge system further comprises a leak indication member being movably arranged inside the hollow waveguide in such a way that a force resulting from leakage of the fluid at the sealing member causes a movement of the leak indication member which causes a change in at least one microwave propagation characteristic of the hollow waveguide. The pulse responses acquired from the user stations are received by the master station. The electrical components can also be attached to the eyewear as an after-market enhancement.

1459828213-dcf30e53-05d9-48cb-b515-47cebdc4f0e8

The present invention relates to freestanding carbon nanotube paper comprising purified carbon nanotubes, where the purified carbon nanotubes form the freestanding carbon nanotube paper and carbon microparticles embedded in and/or present on a surface of the carbon nanotube paper. The disk has a locking mechanism including a plurality of locking elements which are equally spaced in a circumferential direction. In some embodiments, the energy calculation is also based upon a second current from the second module. The cavity between the frame and the AAC blocks is injected with structural insulating foam. Knowledge generated and accumulated in the autonomous learning system can be cast into semantic networks that can be employed for learning and driving tool goals based on context. Also provided are polynucleotides encoding the engineered ketoreductase enzymes, host cells capable of expressing the engineered ketoreductase enzymes, and methods of using the engineered ketoreductase enzymes to synthesize a variety of chiral compounds.

1459828214-ce94450c-8c85-4302-ac99-f278fa9b102e

Magnetic film comprising a substantially crystalline magnetic layer and an intermediate layer alternately formed in contact with each other, wherein the magnetic layer has composition 1001A11, wherein:. The end cap assembly has a mounting ring attached an end of the casing. The compounding is adaptive, such as

through adapting the image regions, weighting, or type of compounding as a function of correlation, location within the image, estimated motion or combinations thereof. More controlled voltage rise and fall times may improve X-ray emission and detection synchronization. The axis of emission diverges in the emission direction from the axis of reception at an angle of at least two degrees.

1459828214-e17aa347-1327-48b9-8a89-adff8bc8767c

An image sensor capable of overcoming a decrease in photo sensitivity resulted from using a single crystal silicon substrate, and a method for fabricating the same are provided. Crop material enters the duct until a pre-determined level has been reached at which time a stuffer transfers the pre-compressed crop to the baling chamber. The datalink application processor includes a datalink message manager. The method further includes presenting a first audio signal having a number of audio frequencies to the patient and applying a stimulus current to one or more stimulation sites corresponding to the number of audio frequencies of the first audio signal. The solution is further energized to a range of energy densities such that tissues to be affected are sealed against flow of blood, lymphatic fluids, air, and other bodily fluids and gases.

1459828214-ed4a4f1b-bb4c-49d6-b45d-c1d34abfdf95

A flavoring composition for a minced-fish product comprises from 0. The system provides for on-demand and virtual on-demand delivery of electronic books. The coating is composed of one or more refractory layers of which at least one layer is a texture-hardened  $\text{Al}_2\text{O}_3$  having a thickness ranging from 2 to 20  $\mu\text{m}$  being composed of columnar grains with a lengthwidth ratio of 2 to 12.

1459828214-f5e5fc93-f16a-4660-b26c-e618a823a5b1

An image processing apparatus estimates an estimated object region including an object on an input image on the basis of a stored object data, obtains a similarity distribution of the estimated object region and peripheral regions thereof by at least one classifier, and obtains an object region coordinate and a template image on the basis of the similarity distribution. The valve member moves between a first position and a second position and the valve is opened and closed. The coupling part is composed of magnetically attractive material and includes a protrusion.

1459828215-8b68e60e-f964-42c7-9617-7a980f731a21

An apparatus for separating a stream of particles comprises a charging device for injecting a net charge into a plurality of particles and a collector adjacent the charging device. The back frame has a lower segment pivoted to a chair control, an upper segment for thoracic support, and links forming a four-bar linkage with the upper and lower segments, with a joint being formed at the lumbar region. The base station further has M second groups for transmitting radiofrequency signals to the first groups. A tribological coating on the spacer ring and/or protrusion significantly reduces wear therebetween. The first part electrically connects to the main antenna or to the main board feed line, and is designed to radiate.

1459828215-ec0beb46-2972-4296-92e4-57da5343fa2e

An aircraft is disclosed having an engine and a propeller mounted to a fuselage. Another aspect of the present invention is directed to a pharmaceutical composition comprising, a pharmaceutically effective amount of one or more compounds of formula I according to claim 1 in admixture with a pharmaceutically acceptable carrier. The second solid-state light source is adapted to emit light through the aperture in a second illumination pattern. The first and second spur gears meshingly engage such that the second spur gear rotates in the opposite direction as the first spur gear. The rule generalizations optionally concentrate on groups of data elements having at least a predetermined number of parameters having the same values for both important and unimportant data elements, reducing the chances that a generalization rule will find important data elements as unimportant.

1459828216-04ba9809-d5ef-493a-8897-344c2f829b9b

A package includes a pour spout and a closure cap. , thereby causing solidification of the solution or dispersion in the form of droplets, and wherein the solidified droplets or pellets are isolated and dried. Numerous other aspects are provided. A first one of the inks contains Direct Blue 199 as a primary or exclusive dye, a second one of the inks contains Reactive Red 180 as a primary or exclusive dye, and a third one of the inks contains Reactive Yellow 37 as a primary or exclusive dye.

1459828216-43082aa0-a299-4407-a72e-d67a5c89f80e

A computer system dynamically scales back latch requests for system resources. The present invention also relates to isolated nucleic acid sequences encoding the subtilases, nucleic acid constructs, recombinant expression vectors, host cells comprising the nucleic acid construct, and methods for producing and using the subtilases of the invention. The user interface definition with the information list is received.

1459828216-de247609-f883-46df-91ee-e8b2607eef47

A metered dispenser includes a housing including a reciprocable piston drive stem including an inlet opening at a first end thereof, a floating piston at a second end, and a passage between the first and second ends. The network node configures cells for non-contiguous downlink operations based on a signal received from a user equipment. Arranged inside the damping mechanism there is at least one securing element for fixing at least one thread which, at the proximal end of the device, is guided out from the outer body through an aperture in the base. The elongated groove is sized to allow the blocks to be turned and moved depending on the type and design of the particular wall being constructed.

1459828216-ea55d813-fa49-44f7-ad3e-72c1cb656513

In a network environment that includes a plurality of nodes and that uses a markup language to create documents, a method for filtering the documents is provided. The method of manufacturing a light emitting device is characterized in that: a solution containing a light emitting material is ejected to an anode or cathode under reduced pressure; a solvent in the solution is volatilized until the solution reaches the anode or cathode; and the remaining light emitting material is deposited on the anode or cathode to form a light emitting layer. The way in which correction calculation is carried out in the correction calculation section 12 is changed for every frame. A determination is made as to whether the operating system unavailable after a period of time passes. The rotated water dividing device includes a third though hole having a through hole opening that corresponds to the bottom end opening of the water divider shell.

1459828217-066dd87c-a829-4751-acd2-b151ba775ec5

The present disclosure provides a cyanoacrylate-based composition comprising a cyanoacrylate component and an organic micropulp component dispersed in a curable acrylic monomer matrix. Bottoms of the barrier layer of the first conductivity type and the diffusion layer of the second conductivity type are positioned on the first main electrode side of lower ends of the first conductor layer and the second conductor layer. Thus, the present invention provides methods for screening and/or diagnosing a respiratory, cardiopulmonary disorder or disease such as chronic heart failure, and/or methods for monitoring the efficacy of therapeutics administered to subject to treat the disorder or disease. The method includes illuminating a mask pattern of an attenuated phase shift mask with an illumination configuration including on-axis and off-axis components, the off-axis component of the illumination being an annular illumination extending near a pupil edge, and projecting an image of the illuminated mask pattern onto the substrate.

1459828217-29d12a8c-5dda-49d1-9fe4-6cd3c599b867

A modular headboard system is provided. An embodiment of a pressure relief device includes a housing having an opening associated with a first end, an opening

associated with a second end, and an over-pressure opening. The stored value for its power level is the power level that was previously successful with the transmission characteristics in achieving the Showtime data transfer mode. The storage management system includes a user interface configured to display the storage management information for the storage objects. For this reason, it is possible to prevent the registration and authentication of a wireless terminal of an external user who cannot easily operate the wireless base station, and thereby it is possible to realize the secure and easy registration and authentication processing even when the wireless communications are used.

1459828217-f0e35efe-57fc-460f-83d6-5c566ae7bfc1

A position determination system of a hybrid method, which is capable of complementing the problems of a position determination method, in which a global positioning system is used, and a position determination method, in which a mobile communication signal is used, by combining the above two methods with each other, is provided. The techniques of shallow trench isolation utilize foamed polymers, cured aerogels or air gaps as the insulation medium. Furthermore, the device is arranged to be controlled by one or more operational sequences of the control means, which operational sequence is composed of at least one directional transfer from the normal position to the auxiliary position and at least one movement of said second movements which follow each other substantially immediately.

1459828218-4c07dcd0-dd6b-475d-96eb-eaf08b5b5031

A method for concurrently converting a standard volume to a thin-provisioned volume includes initially establishing metadata for a thin-provisioned volume. A data output system for rendering at an output device output content managed from an information apparatus includes means for obtaining a document object relating to the output content managed from the information apparatus and means for obtaining an output device object with one or more attributes corresponding to the output device. The thermite structures can have high hydrogen contents and small dimensions, such as micrometer-sized and nanometer-sized dimensions. A line card is operable for receiving non-regulated alarm report data that is not regulated in accordance with Underwriter Laboratories 1610 requirements and establishing a bi-directional link for the non-regulated alarm report data between any central station automation system and the alarm panel at the premises until the bi-directional link is no longer required. Limiting the use of this dynamic address pair to a session lifetime and by preventing a mobile node from knowing the static address of a home agent may help protect the home agent from attacks. When an alternative drawer, such as one containing charcoal is employed, fuel from the pressurized tank is blocked from emanating from the tank.

1459828218-810e8e14-41c0-4ecc-8503-7ff4aa1bc8c3

A container, or pod, is provided for a pontoon boat in which an engine is disposed within the container and the container is supported below the deck surface of the pontoon boat. The container is configured to be shiftable about an intermediate hinge portion and provides a dispensation port defined by a frangible connected panel of the container. The holder can hold circular knitting needles connected by a flexible cord, for example. In accordance with an instruction from first host computer, updating of replication-target data and creation of a journal are performed in a storage system A; and updating of replication data and creation of a journal are performed in a storage system B. The openings along a leading edge of a row are shaped to receive a hinge rod snugly with little clearance. The semiconductor device includes a semiconductor substrate, a piercing electrode configured to pierce the semiconductor substrate and electrically connect the wiring board and the semiconductor device, and a ring-shaped concave part provided so as to surround the piercing electrode, the ring-shaped concave part being configured to open to a wiring board side of the semiconductor substrate.

1459828218-ac3b919d-a6d4-406b-93a5-7f428690e71d

Real-time imaging of a moving object such as the heart uses fast imaging with steady precession traversing spirals in k-space. An electrically conductive frame is attached to a first surface of a substrate. Namely, properly associating a search term with the correct category will greatly enhance the generation of search results with higher relevancy.

1459828218-e00fbd88-5c0e-4e9e-88bb-edb306b725bc

A semiconductor laser structure is provided. A 4-wire assembly is used for replacing conventional incandescent light bulbs with fluorescent light bulbs in existing lighting fixtures recessed downlights, in particular. The drive assembly is connected to the crankshaft for rotation in unison therewith. The transfer function provides a substantially linear region at a center of a corresponding error window, including a first step size in the center of the error window and at least one other step size in a peripheral region of the error window that is larger than the first step size.

1459828219-158f102c-3410-4ba7-88d9-a7ce5db2aef9

A stacked electrical connector includes a first insulator and a second insulator mounted together. The first server computer may include a search engine and the first response may be a search result from the search engine. Between the retaining element and the bottom unit a gap is formed.

1459828219-1a12547f-6332-4d1d-bc34-f84b3d37c9e6

A field effect transistor that includes a drain formed in a first plane, a source formed in the first plane, a channel formed in the first plane and between the drain and the source and a gate formed in the first plane. The memory cells of the memory device can be selectively addressed for a writeread operation and the sense amplifier system is used for readout of polarization states of the memory cells. The first hollow portion may be on one end of the generally cylindrical body and may define a generally cylindrical hole. Several vents each extend zigzag from the top surface to the bottom surface. Other instruments such as optical fibers may be incorporated within the device. This has caused the problem of a risk that the stored fingerprint information leaks to the outside, as well as the problem that the use of the image processing systems is limited to those who have registered their fingerprint information.

1459828219-7ff14c7d-dbdb-423d-b0c6-eb2f2a0cf04a

A method and system for transmitting messages in a communications network is disclosed. A source region is provided at one side of the gate trench within the semiconductor substrate. The optical multiplexerdemultiplexer includes a multiplexingdemultiplexing filter serving as a long-pass filter. The memory may include at least three databases. The hydrogel is particularly swellable in water, e. The system includes a first transistor coupled to a first voltage and a second voltage, a second transistor coupled to the gate of the first transistor and the first voltage, a third transistor coupled to the gate of the second transistor and the first voltage, and a capacitor coupled to the gate of the second transistor and the second voltage.

1459828220-5dd8d663-d116-4430-87a1-6bdd61928a5a

The present invention is directed to substituted 3-aryl-5-aryl-1,2,4-oxadiazoles and analogs thereof, represented by the Formula I: wherein Ar<sub>1</sub>, Ar<sub>3</sub>, A, B and D are defined herein. The downstream end of the flared bowl includes a divergent with a double partition delimiting an annular cavity. A magnetic transfer apparatus that includes magnetic field applying means having magnetic poles that extend from the interior to the outer periphery of the conjoined body, and rotating means for relatively rotating the conjoined body with respect to the magnetic poles is employed. Operating the memories in both a \u2018flipped\u2019 mode and a \u2018non-flipped\u2019 mode helps cause the Bias Temperature Instability degradation to be symmetric, thereby not degrading the Static Noise Margin

degradation of the cells. By employing as the preamplifier a differentially operating preamplifier, the circuit obtains in relatively simple as well as cost-effective fashion at the same time a high level of common-mode signal rejection and a substantial suppression of the low-frequency components in the differential signal occurring below the measuring frequency. The second frame has multiple first scan-line groups in relative darkness and multiple second scan-line groups in relative brightness, which are alternately displayed.

1459828220-c9b089df-8331-4f69-88c5-08ae914d4f76

Collapsible container comprising a bottom element with openings at the corners for disengagable attachment of two opposite gable walls. Reservoir fluids from a reservoir intersected by the wellbore are characterized based on the composition and isotopes of the injection fluid and of the production fluid. The arms include retaining structure for retaining a splice element in both of either one of an upper region and a lower region of a channel. A differential pressure generating mechanism is connected to the housing.

1459828220-fbc25dde-e6c1-4fc8-a8d4-d23337afc7d8

An automated machine tool with a workpiece carrier for receiving a printed circuit board, at least one drilling station for processing printed circuit boards, and a mechanism for sequentially applying individual printed circuit boards onto the workpiece carrier and for removing printed circuit boards from the workpiece carrier. The disk drive further includes first and second disks disposed about the spindle motor hub. The method includes applying, by the data access layer, a mapping module to the object request to access object data associated with the object request. The schema builder is a table driven interface that converts the schema elements in the XML document into DTD objects. The preview web application dispatches the request to the live production web application on the live production server. The destination cache directory determines a target node based, at least in part, on its cache coherency status information to reduce memory access latency by selecting a target node where all or some of the operands are valid in the local cache memory.

1459828221-029fa05a-be97-4055-ab43-7fbafafc3122

Broadly this invention provides an inbred corn line G4901. In accordance with an important aspect of the invention, damage to relatively fragile structures, such as submicron dimensioned structures on semiconductors are minimized by utilizing an adhesive tape to peel off undesired metal in close proximity to submicron dimension structures. The layered structure also comprises a spacing layer electrically isolating the first conducting layer from the second conducting layer. A length holding unit stores, for each page, plural pixel counts, the pixel counts representing respective numbers of pixels in rows of pixels spaced in the sub-scan directions, which pixels represent the image data for image formation. The method includes steps of producing a first control signal activated at a data update mode in which a read or write operation is executed, and determining in response to the first control signal whether the read or write operation is executed for the same page or a different page. Further, a drive device is such that the connector device is attached to a printed circuit board having a circuit unit configured to control an object to be controlled.

1459828221-133bfdd7-e0fd-435d-b446-1f66c37a9755

A method, computer program product, and computing system for receiving a read request on a first cache system, wherein the read request identifies previously-written content included within a data array. The first and second meniscus control features may be substantially coplanar with the die attach pad. The output shaft of the drive-motor and the input shaft of the transmission are coupled together such that, during normal operation of the drive-train, rotation of the output shaft of the drive-motor results in a proportionate and uninterrupted rotation of the input shaft of the transmission.

1459828221-8acc8e27-51b9-4777-ab57-e0833d96c28f

A thin-film device incorporates a device main body and four terminal electrodes. The client terminal includes a plurality of interfaces to the IP distribution network, the interfaces configured to receive media packets according to multicast, unicast, and peer-to-peer media distribution protocols. Then, responding to a color temperature set and a brightness set from the control device, a first PWM and a second PWM is generated. The first structure and the second structure are connected to each other at a joint. The first attachment portion is detachably attached to the first operating unit by a first adjustable connection. The frequency of the output clock can be tuned dynamically according to the first overflow signal, and the spectrum of the output clock can be spread.

1459828221-b8c8c88e-4417-4562-bf97-38c57e32696d

Systems and methods for dynamically controlling a tuner are provided. The first step provides for a fine channel selection and upconversion of a desired channel to either positive or negative IF. In this configuration, the wash-out in the warning display unit, i. An active silicon layer is formed overlying the insulator and trench, with a gate oxide layer over the active Si layer.

1459828222-4e9ef00c-6a1a-4258-ba0c-008d74077d3c

Broadly speaking, an invention is provided for monitoring a plasma optical emission. The dosimetry plan is available in near \u201creal-time\u201d because of the novel geometric model construction of the treatment volume which in turn allows for rapid calculations to be performed for simulated movements of particles along particle tracks therethrough. A user can attach modular tags that are intuitively recognizable as performing a particular function, such as a color change, font size change, font style change, highlight operation, and application program initiation.

1459828222-524339f7-27ba-472b-914b-e3f22ffee581

In one embodiment, the present invention includes a method for determining if a frequency control instruction would cause a first capacitor bank to reach a limit and adjusting the first capacitor bank in a first direction using a calibration value and adjusting a second capacitor bank in a second direction if the first capacitor bank would reach the limit. A navigation layer is provided within a web browser application to enable pre-processing of a markup language within a web page retrieved from a web server. A general purpose operating system is booted on the second partition. The content provisioning application is configured to access the user database to identify a user, determine rights of the user from the user database, and send a user interface to a client computing device that provides user interface items corresponding to the rights and associated links of the user. the boehmite particles are made up of mainly anisotropically shaped particles. The circuit board has a plurality of through holes penetrating through the electric circuit layer and the heat-conductive layer of the circuit board, wherein each of the through holes is filled with heat-conductive material.

1459828222-664e713d-c53b-40af-b1b9-3e2778f8a28a

Optimized designs of heat exchangers, and, in particular, heat exchangers and assemblies comprising multi-exchangers or combo coolers comprising different heat exchanger parts or elements, and fins or separators of different types and/or characteristics on the different tube parts of the heat exchanger results, are disclosed. Each toy character has one or more one or more electronic signal receivers, and an electronic system. The wheel set includes front and rear wheels disposed respectively on the front and rear ends of the bicycle frame. The hydrogen reacts with a catalyst formed on an anode electrode at the hydrogen side of the channel to release hydrogen ions which are absorbed into the PEM. Further, the connector is grounded through the metal elastic piece and the metal casing so as to actuate the circuit of the memory card. The light-receiving element whose light-receiving surface is in substantially contact with the ridge portion detects as the

ridge portion a bright portion where the scattered light emerging from the finger reaches at a high intensity.

1459828222-dfa9a9e8-4cf9-4254-9494-63d8b722b8fe

The present invention provides delivery systems for and methods of delivering conduction protein genetic material to cardiac cells in localized areas of the heart to improve the conductance therein. Each vane has a projected part that is positioned close to, and projects toward, the intermediate transfer belt. The tool has through-holes supplying the mist to a cutting blade portion.

1459828223-1de00344-14de-4027-b297-8ff56d923cea

A parcel shelf structure in a rear area of a vehicle body includes a parcel shelf disposed between first and second rear cross members. The controller includes a pre-processing block for receiving data frames and a frame processing unit coupled to the pre-processing block. At least one load cell can have a first end that is supported by the stem head adapter plate and a second end that engages the upper ring. In some embodiments, the envelope generator may be configured to encapsulate the payload portion such that packet boundaries may be identified. By applying a voltage difference to the metal wire and the monitoring ramp terminal and measuring the resulting current flowing through the metal wire and the monitoring ramp terminal, it can be determined whether localized metal precipitate is formed at the metal wire. If a position of an apex of the first rectangle area farthest from a reading reference position and a size of the first rectangle area satisfy predetermined conditions, image data corresponding to a second rectangle area including the first rectangle area and the reading reference position are output.

1459828223-399291ef-6f96-443d-b780-82ca6b3819a8

A differential assembly includes an electrically operated input device and a first planetary assembly in driving engagement with the input device. The serving base station is configured to perform mobility optimization in the minimization of drive test accordingly for improving handover success rate and overall network efficiency. A thin film stack color filter is further disclosed, which can be designed to either function as a transmission color filter with efficiency twice that of conventional colorant based color filter; or as a reflective color filter for display devices.

1459828224-0aad2051-9986-4456-b011-e89ff9fffd59e

A dual-energy x-ray detector includes a plurality of x-ray detector elements that detect x-rays that are generated by an x-ray source and that have passed through an object. A flexible boot extends from the plug to seal the prongs and contacts from moisture. During the first stage of injection, the flow to the nozzle only goes through a restricted orifice. The imidazole carbene salts disclosed include those synthesized by reaction of imidazole carbenes with an acid or alcohol suitable for creation of a salt. The photographs are cataloged in the server according to the identifying data and can be subsequently ordered using the server which is typically an Internet web-site.

1459828224-268f160c-d804-4b07-bb99-3d50104b46ab

A sighting device, for use by a golfer while standing on a ground surface and gazing at a golf ball upon the ground surface at a natural viewing angle, and hitting the golf ball. Generally, the apparatus includes a double wall plating vessel having an inner cup and an outer cup peripherally surrounding and spaced apart from the inner cup. In exemplary embodiments, the matching algorithm accounts for common variations in student names and geographical distances between secondary institutions and the student's current known address to generate higher confidence matches. Instructions within blocks are moved to predecessor blocks when there are no dependencies on the instruction to be moved, and when the move results in greater opportunity for instruction level parallelism. The invention pertains to radiation-curable compositions which contain, in addition to typical components of

radiation-curable epoxide and oxetane compositions, a free radical photoinitiator.

1459828224-3b58ad20-558e-4c60-9e07-c23fde98b7c0

Disclosed herein is a nanostructured material comprising carbon nanotubes fused together to form a three-dimensional structure. There can also be a tubular extension. The first structure reflects optical radiation in a first direction substantially orthogonal to the plane. The redirectionreassignment occurs according to a function within the cache to which the request is directed so that the switch remains freed from additional tasks that can compromise speed.

1459828225-005e9e90-459f-46c3-91cb-b44431a3f524

A dual-function padlock includes a lock body, a numeral detent unit, a U-shaped hook, a hook member, a numeral unlocking member, and a lock core unit, providing a simple configuration. At least three current controlling means are coupled to each other to form a symmetrical configuration and receive input signals from said first and second loading means for minimizing variations in the oscillation frequency of the VCO. The meta-information is added to contents transmitted to the client terminal before the contents are relayed.

1459828225-255ed21b-0094-409b-b4fd-9e25ca2d84a5

In a process for automatically determining the modulation transfer function of a focal plane array cameras, a test grid is used to generate a beat whose amplitude corresponds to that of the grid image to be measured, without the sampling MTF. Data to be incorporated into the specification is stored in a database. The second environment authenticates and initiates the policy and role provisioning environment as a virtualized federated role provisioning service or a shared policy decision point service.

1459828225-9f2e3142-cfb1-4418-a56a-45752b43212d

An apparatus and method are disclosed that may include a contact pin; and a plurality of loops of conductive wire, coated with insulation material, disposed in proximity to the contact pin, wherein along at least one portion of the conductive wire, at least one edge of the contact pin extends through the insulation material and thereby forms conductive electrical contact with the conductive wire. The mold comprises a compartment having a compartment floor and a depression extending downwards from the compartment floor. Speed and memory enhancements are realized by establishing an activation stack frame template with a set of criteria. An amount of the first set of drops of fluid to perform the printing routine and an amount of the second set of drops of fluid to perform the service routine may be less in the low consumption state than in the normal consumption state. A thermally conductive, but electrically insulating, spacer of essentially the same thickness as the laser diode or bar surrounds the diode or bar to prevent mechanical damage while still permitting the conformable material to be maintained in a compressed state and directing current through the laser device. A communication unit communicates information with the external device through the interface selected by the selection unit.

1459828225-d605c91a-6bae-428b-972f-779be46679ec

Embodiments of the invention provide a programmable FSA building block, having a number of programmable registers and associated logic implemented therein, that provide the capability of contextually evaluating complex REs of arbitrary size against multiple data streams. The coil winder includes a brushless DC motor, a single chip for controlling the DC brushless motor and a digital display screen. Subsequently, some of the buffered data is maintained in some, but less than all, the segments of the buffer. An opening value is sent to a control part, and X-rays irradiate a subject P on an irradiation condition of a tube voltage and tube current based on the correlation table. By continuously sensing and updating the relative physical distances and orientations of each device to one another, the devices show the user a view into the 3D content that is spatially correlated. In

this regard, the method, apparatus and computer program product do not blindly provide information regarding a neighbor cell that the current cell has already collected, but, instead, first determines if the neighbor information regarding a prior cell is different than and therefore will add to the information regarding neighbor cells that is already maintained by the current cell.

1459828226-00e019de-b309-42c1-93d3-49a78d42d2eb

An apparatus for estimating a timing offset of each of orthogonal frequency division multiplexing symbols that are fast Fourier transform -processed. The laser enhancing additive comprises a first quantity of least one of copper potassium iodide or Copper Iodide, and a second quantity at least one substance selected from the group consisting of zinc sulfide, barium sulfide, alkyl sulfonate, and thioester. The elastic layer is bonded to the surface of the nonwoven fabric such that the elastic layer forms a stronger bond with the first bonding zone on the surface of the nonwoven than the bond formed between the elastic layer and the second bonding zone on the surface of the nonwoven. The methods described herein are applicable to a variety of printers, including raster and PDL printers.

1459828226-85cf0b4d-fdf6-49f7-976d-b713818d05db

A method, performed by a transceiver, is described. The invention further relates to the use of cobaltoxidehydroxide thus prepared in the preparation of catalysts or catalysts precursors, especially catalysts or catalyst precursors for the conversion of synthesis gas into normally liquid and normally solid hydrocarbons and to normally liquid or solid hydrocarbons, optionally after additional hydrotreatment, obtained in such a conversion process. In addition, the method includes applying defect detection method to the stored output corresponding to the first portion of the physical locations to detect defects at the first portion of the physical locations and generating a wafer inspection process based on the defects detected by the defect detection method at the first portion of the physical locations. The size and the data rate are based on the channel quality information. In one alternative embodiment, when unlocked, the bolster automatically swings open to the predefined operating angle. Many aspects may also be used to track other objects such as hotel keys.

1459828226-afba3f9e-1895-4288-ae87-7fce5d363771

A vehicular lamp used for a vehicle, includes a semiconductor light emitting element for generating light to be emitted by the vehicular lamp and a current controlling unit for changing a current supplied to the semiconductor light emitting element based on the speed of the vehicle. A substantially U-shaped first aperture is formed in the tip portion, with an open end of the first aperture opening toward a central portion of the board. Individually controllable light sources are included where each light source is arranged for activating one electron source. In its storage position the duct member obturates the discharge opening and extends over the top of the container.

1459828227-34c1ec11-5e25-4df6-8f1b-237c1340622a

The pharmaceutical preparation useful for treating a skin or mucous membrane lesion is provided. A JPEG expansion section expands image data of the image file by MCU. A nozzle directs a flow of cooling fluid onto the fins and is disposed above the base plate and below the top extremity of the fins. Still further provided by the invention are methods for producing soybean plants by crossing the soybean variety A1026332 with itself or another soybean variety and plants produced by such methods. The body part also includes flocking coupled to at least a portion of the surface that adjusts an aerodynamic characteristic relative to the surface that is devoid of the flocking.

1459828227-b7a5888d-bb57-4984-bc90-4578668273b7

The present invention provides a compound of general formula A, useful as potential antitumour agents against five human cancer cell lines. A DC bias circuit is used

for controlling the operation of the amplifier. A surface feature is formed in the tube wall proximate the exterior. The locking assembly locks the position of the electrical contacts and restricts access to the actuating assembly. We also present algorithms to retransmit lost packets, to maintain the overhear table and to compensate for the retransmission of packets of other nodes. A game server data storage can be in communication with the game server processor.

1459828227-ca77e7a4-0362-42e6-8d84-3a275e8b972f

A flexible slide joint is provided for accommodating axial, rotational and angular misalignments between two fluid conveying members. More specifically, according to a preferred embodiment, management behavior is controlled by management policies that specify management actions to be performed for managing a communication network, for example. The semiconducting device further includes a first wire that is bonded to the substrate and to the interconnect device and a second wire that is bonded to the interconnect device and to the die. Due to N2 plasma process, a nitrogen layer is formed at the interfaces between the dielectric layer and the undoped polysilicon layer.

1459828228-3b445b01-55d5-4de8-baae-3f8870924c49

A transfer client system exchanges files with a transfer server over an open network such as the Internet. Fixing the two opposite sides of the CNT film on the first electrode and the second electrode, the CNTs in the CNT film extending from the first electrode to the second electrode. The PM client module may obtain call statistics data and issue tracking data from the PM database via the PM display data module.

1459828228-5aa74b88-d9e9-4119-b79c-012808274088

A rotary circuit selection device having a driving cam and an operating cam, each having a series of alternating peaks and valleys. The information may be any digital information which can be stored in a computer file. The IF circuit receives an IF input signal and a flag signal and generates an IF output signal for application to a slave circuit, wherein the IF input signal is based on the master output signal, and the interface circuit generates the LF output signal either dependent on or independent of the IF input signal as indicated by the flag signal. The impregnated liner is suitable for pull-in-and-inflate method of installation or may be everted. Thus, the pixels can be driven with fewer data lines than with known arrangements.

1459828228-692ac7f6-76c6-4a87-99c3-299317826b53

According to the present invention, computer based techniques for using information technology in therapeutics or drug discovery. This disclosure is further directed to a coating composition comprising components derived from renewable resources. A subset of destination address bits may be used in the first stage to hash to a selected partition for the second stage.

1459828228-6d1c547f-930d-425e-ba1b-ebd33b2a1a16

A floating gate is provided in the form of two separated parts in one memory cell to allow each of the floating gates to be individually programmable, thereby enabling the integration to be doubled in the same memory cell as compared to the case in which a single floating gate is provided. The system comprises a core array having a plurality of columns and a redundancy column each configured for reading or writing a bit of information and circuitry for steering around a defective column in the core array, wherein the circuitry includes one column multiplexor, which results in having the memory column redundancy scheme include one multiplexing stage. A stress layer overlying the transistor array produces stress in a channel region of the transistor.

1459828228-d7363bd5-fcd5-406e-8635-b95b7d027c5f

A shimless aligner for insertion between a machine foot and base to align the foot

relative to the base, which foot and base are secured together by a hold-down bolt extending between the foot and base. The reed is mounted on an air inlet end of the inner tubular sound chamber, and an air outlet end of the inner tubular sound chamber extends into the outer tubular sound chamber. These constructs are useful for modifying microbial strains to improve production and recovery processes for polymers such as intracellular proteins, such as enzymes, growth factors, and cytokines; for producing polyhydroxyalkanoates; and for producing extracellular polysaccharides, such as xanthan gum, alginates, gellan gum, zooglan, hyaluronic acid and microbial cellulose. Different radiation parameters such as the reflectivities  $R_s$ ,  $R_p$  and ellipsometric parameters may be used in measuring the diffracting structures and the associated films. Such chains also include means to drivingly engage sprocket teeth of a sprocket drive. The LED modules are located between the second fins.

1459828229-6481e7f4-11cb-44f5-b5fa-4ebf11f83c99

A CCFL driving system for multiple CCFL loads includes a transformer, a CCFL circuit, and a controlling circuit coupled between the transformer and the CCFL circuit. A stiffer more upright and more compact growth habit is displayed. Each crossbar is operable in a first or stowed mode axially aligned with a siderail and in a second or carrying mode laterally spanning the space between the side rails. In the second mode, a program that has been reproduction restricted is prohibited from being reproduced.

1459828229-7c166f9f-66c3-49ed-a829-2e4c471099c9

There is provided a composition for healing burns and wounds in mammals, which contains a cromolyn compound or the combination of a cromolyn compound and hyaluronic acid a corticosteroid. On the first element hologram, main data is recorded such that the main data is converted into a two-dimensional image, object light of the two-dimensional image is interfered with recording reference light, and an interference fringe produced as a result of the interference is recorded on the first element hologram. The UE terminal includes a first power control module for controlling a first transmission power to be applied to signals used for communication with a base station. A lumber support in the bin has an elevator mechanism and can be lowered to a discharge position in which lumber on the lumber support can be carried away by the conveyor. As the slope decreases, the rail is narrowed to the same effect.

1459828229-88afc09c-47c7-4187-a49b-8295969f163f

Methods of treating a subject for a cardiac arrhythmia are provided. The plug is comprised of at least an expandable inner core having an outer surface and a transportable outer skin that preferably substantially encapsulates the core. A baseband processing circuit processes baseband signals output from the first and second mixers.

1459828230-1dca124a-f6ec-4a83-9490-00ef581ddd74

Programming language constructs called pronouns and referents, and a method, system, and apparatus for translating computer source code that contains the pronouns and referents. The top plug and bottom plug are launched by different mechanisms, thereby preventing premature release of the top plug during a cementing operation. In group operation, the lifting devices are jointly controlled through the bus by one switch. The prepolymer includes a polyester-based monomer. When handling a request to invoke a operation on an object, the system dynamically dispatches to the correct provider based on this mapping. The invention is to solve the problem of high viscosity without changing the characteristics such as particle size and specific surface area of the copper powder obtained by a wet reduction method.

1459828230-23bc0375-e59c-4ca2-853b-35e5620b0b3e

A method for specialized photofinishing goods and/or services produced from a one-

time-use camera, including providing a label on the one-time-use camera, with at least one area containing first instructional information, that identifies particular photofinishing goods and/or services to be applied to images captured by the one-time-use camera. The three-dimensional imaging system for robot vision comprises one or more camera systems, each of which has at least one variable focal length micromirror array lens, an imaging unit, and an image processing unit. The complex interacts with the evanescent field and emits light that the detector is positioned to detect. In a third embodiment, content is distributed on demand after the publication time by a media distribution server. The cable connector plug has good mechanical strength and stability.

1459828230-37a88141-904f-4231-878c-2bdc4c47f054

An extension rod device working with a fixer for handheld, portable, mobile devices, and includes a rod body whose two ends are detachably attached with a positioning frame and a securing member. The device and method may include a scanning mirror, a plurality of input optical fibers, a plurality of output optical fibers, and at least one sample optical fiber optically connected to a photodetector. The orbital sander further includes a fan having non-uniformly spaced blades, eliminating the need for a conventional counterweight, and a dust outlet adapted to be alternatively connected to a dust canister or alternate size collector vacuum hoses. All correlation coefficients are obtained among the given discrete stochastic variables and the additional discrete stochastic variables. The lagging cable end of the cable section is supplied to the second crimping station for assembly with a crimping contact. The treatment is safe and improves ejection fraction.

1459828230-7e2b3141-2ad9-494b-9693-bb1d531a9721

The invention relates to a method for devulcanizing a sulphur-cured rubber, which rubber contains a network of a polymer, which polymer has a main chain of carbon atoms, in which for the vulcanization per 40 carbon-carbon bonds in the main chain a maximum of 1 unsaturated carbon-carbon bond occurs, by heating the rubber in the presence of a devulcanizing agent. The direct memory access controller includes first and second registers storing various values that are used to set the parameters of DMA transfers that take place during a single data transaction. The invention also relates to a kit for separating such materials. In addition, a gram load of the suspension is reduced to minimize the friction force during contact of the TE with the disk such that when the TE portion of the slider contacts the disk the bouncing motion of the TE with respect to the disk is reduced.

1459828231-435b5383-691c-4912-adad-b6e3b81eacf6

A system and method are disclosed for controlling access to goods or services. The butted junction includes an overlapping region formed in the bulk substrate by overlapping the mask windows of the ion-implantation masks used to form the back gates. The Z-height is defined as the distance between the two interlocked members.

1459828231-a80e8a15-a76f-4828-bec5-29fae38a7dff

Apparatus for processing image data is provided, comprising first storage means, processing means and manual input means, wherein said first storage means is configured to store said image data and said image data includes a plurality of components defined by a hierarchy of data processing nodes, and said processing means is configured to process each of said nodes in turn. Embodiments include depositing a UV opaque Si-rich silicon oxide layer having an R. Portions of the lead frame extending from the die paddle are folded around sides of the encapsulated integrated circuit die and over, or adjacent to and level with, a peripheral upper surface of the encapsulated integrated circuit die to form an electrostatic discharge ring. A terminal may receive the broadcast metadata prior to or with the broadcast information, obtain location and time criteria from the broadcast metadata, and filter the broadcast information based on the location and time criteria. The gate stack structure then undergoes a siliciding process with

different variations to finally form a silicide gate.

1459828231-b37d35a7-5e40-44aa-990c-c3f3c259197a

A support leg system and method for supporting a dock leveler. The methodology includes inserting an apparatus within the pipe and moving the apparatus at a predetermined speed through the pipe. This variety was developed by mutation breeding and propagated by seeds for commercial cultivation. The processor can be programmed to produce an oscillating processor signal which is used to produce a corresponding oscillating power signal to ignite and/or sustain ignition of the lamp. The portal may match the phrase to a set in a particular group of sets identifying content across common schemas. The apparatus includes an elongate dilation member including a radially expandable member having a first cross-sectional area; and an elongate expansion member including a tubular element having a second cross-sectional area which is larger than the first cross-sectional area.

1459828232-2cba7801-24c3-4918-8ea3-288700db114c

A capacitively compensated voltage regulator, adapted to be supplied with power from a voltage supply, and having an input port and an output port. The Node Bs transmit dedicated channel data including a first TFCI bit to the UE over dedicated channels. The index summary is utilized for evaluating a path-based query. In operation, incoming refrigerant from the system is simultaneously and continuously directed to the opposing piston heads wherein the forces of the pressurized refrigerant on them counterbalance or neutralize one another. The blood storage element is preferably positioned in parallel with the pump so that the pump may be used to add and remove blood to and from the blood storage element.

1459828232-43fb400b-8515-418e-b6cb-0e5f772de6c4

A video processing chip capable of adjusting aspect ratio and a method of displaying an image thereby are provided. Optimal values for a twist angle of a liquid crystal layer, an angle between a transmission axis of the polarizer and a slow axis of the first retarder, an angle between the slow axis of the first retarder and a slow axis of the second retarder, and a product of birefringence  $n$  of liquid crystal material used in the liquid crystal layer and a thickness  $d$  of the liquid crystal layer are evaluated. Next, a protective layer is formed over the image sensor die. The status daemon is configured to determine the operational status of the processes.

1459828232-8c3989eb-967c-43a7-9920-fb40b413fab1

An access hatch reinforcement module and a method of assembling an access hatch to an existing engine compartment hood of a vehicle. The surface acoustic wave duplexer includes a transmitting SAW filter coupled between the antenna terminal and the transmitting terminal, a receiving SAW filter coupled between the antenna terminal and the receiving terminal, a common piezoelectric substrate on which both of the transmitting SAW filter and the receiving SAW filter are formed, a package covering the common piezoelectric substrate. The switch has an operating handle arranged between the facial cap and the handle of the sprinkler. Each image sensor die may include through-oxide vias that extend at least partially into a corresponding DSP die. The \u00b3PGA conjugates elicit an effective immune response against S.

1459828233-a464b714-3c83-4318-b949-f06649448fcf

A source virtual machine hosted on a source server is migrated to a destination VM on a destination server without first powering down the source VM. The diffuser membrane permeability and the pressure conditions across the membrane are chosen to minimize variation in gas flow velocity through the membrane during the vent-up cycle. The system further includes at least one refracting surface disposed to intercept energy from the plurality of apertures and a reflecting surface to direct portions of the intercepted energy back through the at least one refracting surface and back toward the plurality of apertures. the supply pressure, can be monitored.

An HDD stores the classified program information, and a display displays categories defined by the stored classification criterion horizontally on a monitor screen in a selectable manner and displays only the program information categorized in a selected category vertically on the monitor screen in a selectable manner. The second chamber is maintained at a pressure lower than the coating region.

1459828233-c67da4d6-9a54-498a-b06a-cb83890311da

A body for a mobile device shaped like a sleeve is closed on all but one side and configured to receive an internal body including electronic components through the open side. The main casing includes a first side plate having a first primary portion extending in the array direction, and having a first positioning portion and a second positioning portion spaced away therefrom in the array direction. The calling application also receives user queries that can be resolved by a widget. In another example, intake air flowing in a second direction may be heated via a heat exchange with exhaust gases in order to cool an exhaust catalyst. The compounds of the present invention have improved GlcCer synthase inhibition activity and are therefore highly useful in therapeutic methods for treating various conditions and diseases associated with altered glycosphingolipid levels. The catheter is formed of semi-rigid material and has at least a ninety degree bend.

1459828233-d82876a6-b191-4207-b6af-4bf79c7b1c4e

The present invention aims to provide a slot antenna, an electronic apparatus, and a method for manufacturing a slot antenna which are capable of obtaining multiple resonances with a small mounting space. An interior of the door and side part of front face of leading car are connected pivotally by an upper arm, lower arm, and first link bar so that a parallel linkage is composed, thereby enabling horizontal movement of the door. To this end, the invention provides that the cover consists of an endless helically wound pile strip whose edges are interconnected by an endless helically running seam without forming a step that disrupts the cylindrical outer contour. Al wiring or Au wiring is bonded with the pads.

1459828234-52cb5aad-74a0-4fa7-89b4-3a7ab2830eb0

A printed circuit board comprising a hard portion of at least one main hard PCB, and at least one secondary hard PCB; and a flexible portion to connect the main hard PCB to the secondary hard PCB both physically and electrically and enabling the secondary hard PCB to move in relation to the main hard PCB. The second waveguide has a sensor portion that senses the spacing and directs light representative of the spacing to the second waveguide's output end. The conductor assembly also contains a magnetic shield located above the flexible conductor; the magnetic shield contains an antithrombogenic composition. Alternatively, the support may comprise a single curved support surface. The time necessary for supplying the temperature-controlled gas from the thermoregulator to the optical axes of the X- and Y-axis laser interferometers through the fan duct is equal to the time necessary for supplying the temperature-controlled gas from the thermoregulator to the wavelength compensator through the fan duct.

1459828234-6d93bd19-4cdf-4d9d-9a59-294d9a657dcc

An excited frame vibratory conveyor is described and which includes a base frame; a motor mount made integral and with the base frame; a pair of vibratory motors mounted on the motor mount; and an electrical circuit for energizing the pair of vibratory motors in a fashion which reduces movement of the base frame in a vertical direction. The present invention ensures execution of MIP Registration process after Re-Authentication. Each of the end heads 28, 30 includes a pair of casters 40 mounted to the bottom surface of the end head.

1459828234-f387ab2e-c69e-480d-93de-b55a99af0ab0

This invention relates to an expression vector wherein said expression vector comprises a polynucleotide promoter sequence, a polynucleotide encoding a signal sequence, a polynucleotide encoding an antigen protein or peptide, a polynucleotide

encoding a cell binding element, and a polynucleotide polyadenylation sequence all operatively linked. The source line driver section generates a second drive signal of the source line based on the output from the second DAC, and then generates a first drive signal of the source line based on the output from the first DAC within one horizontal scan period. A press set-up device extracts from the plate image the color characteristic and provides ink flow set-up data to a printing press in accordance with the extracted color characteristic. The changing over units are changed over between at the time of reading image data and the shading correction in the first draft reading mode and at the time of reading image data in the second draft reading mode. The etching gas may also include additional gases such as inactive gases or gases that include the elements H, O, F, He, or C. Each device in the system receives the message and determines whether the device is a participant in the scene.

1459828235-cb5bee6c-065b-4d59-a438-9b97e8ae2dc4

A microscope optical system comprises an objective lens and an intermediate magnification varying part disposed just after the image side of the objective lens. The interconnect has a metal grounding layer of typically stainless steel or copper metallized stainless steel, a metal conductive layer and an insulative layer between the metal grounding layer and the conductive metal layer. An embodiment consistent with the present invention includes an ocular micro tremor sensor and associated signal processing hardware and software for clinical analyses. Once formed the components of this fence system can be bundled in easy to ship sets for assembly in the field. A pixel electrode is provided at a pixel area defined by each intersection between the gate line and the data line and is connected to the thin film transistor. A controller is programmed to detect when an electric jack motor has driven a jack to a jack stroke limit by monitoring one or more jack motor power draw characteristics and comparing those values to known values associated with the driving of a jack at or near the end of a jack stroke.

1459828236-756ae01f-1503-422b-8992-75b2fcd6ba71

An audio system with a removable faceplate. A substantially uniform backlighting of the component can be produced, even when direct backlighting is partially blocked by structure used to support the component during inspection. The side portions preferably taper away from the air bearing surface by an angle of 20 to 45 degrees. At least one further discovery data packet directed at least to said virtual device is received. Algorithms in the transponder are used to determine the frequency deviation and for calculating the direction of the slope of the LFM input signal. In another embodiment, the perimeter portion of the heat spreader is selected from material with a lower CTE than the material for the center portion of the heat spreader.

1459828237-04c3c6ee-8d79-4f9d-8ff8-1e6914e1d3dd

A display device includes a display panel having opposed first and second substrates with the second substrate being arranged closer to a viewer, an upper polarizer which is arranged closer to the viewer than the second substrate, and a resin film which is arranged closer to the viewer than the upper polarizer and is in contact with the upper polarizer. A first conductive layer is formed on a semiconductor substrate, and an insulating layer is formed on the first conductive layer. Related single-clamp needle grasping devices can be bent plastically by a surgeon, and/or have bodies that are grasped by a hand while a portion of the hand actuates a handle.

1459828237-5bee36f5-2b00-4216-a450-f1d21579003d

An electronic device has hold parts constituting respective right and left side parts of the electronic device 1 and being available to be held by a user. The slotted golf club head having: i. The carriage is capable of moving. The network element terminating the tandem connection generates an alarm report including the failed link as indicated by the failed link identifier.

1459828237-8ea56af3-dab1-4dc3-82ad-ecb94524aa03

An electrical connector comprises an insulative housing, a contact set assembled into the housing, a shield enclosing the housing, and a pair of latch devices assembled to the housing. The present invention also provides a method for fabricating the heat dissipating package structure. In a preferred embodiment, the information device is a mobile device such as a mobile telephone, the audiovisual representation comprises a graphical representation such as a bar code that is displayed on a display of the information device, and the bar code representation is captured at the local device using a bar code scanner. If the belt resistance is increased, the timing is advanced and the current is increased. Preferably, a thickness of the semiconductor buffer layer is selected to compensate for over-etching due to non-uniform etching on a semiconductor wafer on which the electronic device is fabricated. The invention can ensure both the authentication success rate and the authentication security.

1459828237-98b906f2-21cc-4370-8855-4a148e9d5f94

A right-angled connector comprises a subassembly including an electrically conductive member or ground shell having a longitudinal section and a transverse section. The system assigns a novelty score to each document based on the determined amount of novel content. A conductive pillar is formed over the first area of the first conductive layer. The method includes determining a first level of activity of the desktop session. , removal of the solvent used in the solution polymerization, and dissolution of the polymers in water to give from 50 to 80% strength by weight solutions, with polymers containing acid groups being neutralized if desired.

1459828237-a11e9375-a54e-40ae-8774-f1cec437e31c

A marking device for marking the location for a support for a mountable object, such as a picture frame, has a body with a compressible or collapsible configuration and adhesive for removably attaching a back face to a backside of the mountable object. For example, an example embodiment may generate a game board on a first client device and a second client device. An InAlAs modulation-doped layer having a relatively wide energy band gap is formed on the quantum wire as a low-mobility channel. The system determines a value similarity measure from the first and second set of order preserved obfuscated substrings. The circular cycloidal mass spectrometer may be structured to provide, under the influence of the electric field and magnetic field, a path of travel for the ion beams, which is similar to either epicycloidal or hypocycloidal curves.

1459828238-947c30f8-842b-41de-a2bb-88c12cd4ec4d

A catheter assembly for delivering an endoprosthesis within a body lumen. Pins extending from the rigid portion of the actuator contact guide surfaces on the latch body to limit travel of the actuator. The device for deactivating the RFID portion of an identification tag provides visual indication that the RFID portion is deactivated. In an illustrative embodiment the clock generator comprises a variable-frequency clock source, and a voltage regulator senses an output voltage of the charge pumps, generates a reference voltage based on a currently selected frequency of the variable-frequency clock source, and temporarily disables the charge pumps when the output voltage is greater than the reference voltage. The method also includes determining, by the processor, a delay time of virtualization on the server based on the reference IO service time and the actual IO service time. In one embodiment, the method comprises maintaining an embedded log in the device, the embedded log being a chain of log entries.

1459828239-287bbbfb-2392-420e-afeb-5f54d3bb022d

Methods, apparatuses, and systems for file migration in distributed systems. An interference-suppressed signal is composed from the first and second symbols. The invention encompasses golf balls having an inner core, an outer core, an inner

cover, and an outer cover wherein the inner core is encased by an outer core wherein the outer core has a volume greater than the inner core, inner cover, or outer cover and the inner core is made of a material substantially free of fillers. A disk subsystem is releasably coupled to the at least one IO module and positioned within the IT enclosure. Greater vertical front wheel travel is provided for improved ride comfort and stability over rough terrain. This invention also provides different uses of the subtracted library.

1459828239-9586630a-a100-4450-8a0b-6cd190febef5

A method for promoting an electronic database-driven gift registry includes issuing one or more database access keys to an organization having one or more members, and providing an incentive for the one or more members to register with the gift registry by initializing respective of the database access keys with a database associated with the gift registry. The fiber processing agent contains a rubber modified epoxy resin. The main body is configured in either an L-shape or straight-through configuration. The present invention also provides a means for programming the cut-off frequency to a desirous frequency value dependent upon the conditions of application within a big range. The method further comprises the step of a computer causing the epoxy injector to dispense the determined dispensing amount of epoxy, via the dispensing end, at the determined dispensing rate.

1459828239-b48a505b-afa4-4117-8063-5cd3a9a72315

A high current density electrogalvanizing process and composition are disclosed for reducing high current density dendrite formation and controlling high current density roughness, grain size and orientation of a zinc coating obtained from an acidic aqueous zinc salt. Each inner region may have different emergency alert messages and may be geographically located inside another region. The interface connector is configured to couple to a module. The resilient member which rests on the guide plate exerts substantially no hold-down force on the rail and merely supports the guide plate elastically against the clamping member.

1459828240-7cb40a40-9e1e-4dd3-9fe0-e76908ae6989

Methods are described for handling an incoming call at a mobile switching center when the mobile station is currently in either an access state or in a paging state. The heavy hydrocarbon feed is slurried with a catalyst comprising iron oxide and alumina to form a heavy hydrocarbon slurry and hydrocracked to produce lighter hydrocarbons. Parameters for the virtual machine section are broken down into three groups: memory, system, and additional. A shaping die is adapted to receive the dual conical tube, and the shaping die is subject to pressurize such that the tube substantially approximates the shape of the shaping die. The soluble LDL receptor protein, and its muteins and fragments, are useful in protection of mammals against viral infections.

1459828240-87b4d76a-aa1f-42d6-af0c-e981c2d7498b

An approach to reducing the size of an output file generated by an optical proximity correction process is described. A basic IO system of the first electronic device is provided with a verification program for verifying a second electronic device. A microprocessor configured with the label body and in communication with the one or more movement monitoring devices time-tags the movement metric when the movement metric exceeds a pre-selected threshold. By so controlling the water content of the organic light-emission medium, it is possible to prevent shrinkage of a light-emission area based on production of non-emission parts or non-emission spots for a long time at both high temperature and room temperature conditions. At this time, even when the high melting point solder is melted in the first space, the size of the first space does not change and the first space is maintained.

1459828240-b3b1144c-037c-476e-9b70-e046441ebf61

This device for taking spherical pictures of a scene comprising a support provided

with securement means for a picture taking apparatus. The pump body includes a pump suction port, a pump discharge port a first oil, passage for supplying oil from a oil pan to the pump suction port, a second oil passage for returning excess oil of a first regulator to the first oil passage and a third oil passage having an outlet port for returning excess oil of a second regulator to the pump suction port. Upon detecting congestion, the mobile device turns on a background data restriction. A first electrode and a metallicmCNT antenna are layered on the first coating, and a plasmonic layer is then added. The sensed rotation may be used to identify or calculate a coordinate transformation matrix that is used for processing the image data. The pneumatic control system may comprise a calibrated vent to shorten the delay in the response of the door leaf to direction from the control system to stop moving.

1459828241-ddd2ebad-cdd7-4a63-8ca5-2581ec2c3477

An output driver circuit for a semiconductor device. The method comprises placing a trabecular shunt through diseased trabecular meshwork, between the anterior chamber and Schlemm's canal. A keyboard may comprise a plurality of spaced apart units in groups operable by respective fingers. The invention accumulates the results of the recursive operations and uses the accumulated results to form a down-converted signal. The surround is retained within the seat by the combination of an o-ring in contact with the surround, and a C-shaped clamp having an upper arm which engages the o-ring and a lower arm releasably mounted to the upper end of the frame.

1459828242-1199b4c9-6313-4e7c-b63b-1081343b3053

A lithium-ion capacitor includes a cathode, an anode, and a porous separator positioned between the cathode and the anode. The fixer heats a heated material by passing the heated material through a press region where the heat roller and the pressure roller meet. A transmitted signal containing a signal addressed to the base station is transmitted at first from the mobile station to the relay station. A carriage 39 of the conveyance frame 12 is caused to travel outside the booth 1, and the supporting arm 13 of the conveyance frame 12 is caused to travel inside the booth, wherein the supporting arm is caused to rotate around the axis. The second antenna sub-system may be tightlyseamlessly integrated with the first antenna sub-system, thereby providing a system with integrated antenna bands which provides omni-directional coverage.

1459828242-8a196296-f530-4b99-a53c-f7fa734424e2

A network and method for servicing simultaneously pending boot image download requests in a multi-client, networked environment. The high speed linear feedback shift register of the present invention comprises multiplexer flip flop circuits. The solid catalyst component is then recovered and combined with an organoaluminum cocatalyst to form a Ziegler-Natta catalyst which is advantageously used for the polymerization of olefins, particularly alk-1-enes such as ethylene, propylene, 1-butene, and the like.

1459828242-d7d532cd-20dc-4ddb-a1a7-59548f30022c

A self-erecting device which can serve as a signaling unit. The method also includes modifying the drive signal such that each drive electrode is driven by a drive signal having a unique first characteristic. Velocity is derived from the measured Doppler frequency shift for each bin.

1459828242-eefbe82d-cc60-4134-a63a-d6f8e794498d

An apparatus, system, and method are disclosed for suspending a data access request during serialization reinitialization of a file server. At least one cyan emulsion layer contains a cyan dye-forming coupler C-1 and at least one light-insensitive colloid layer exists between the support and a light-sensitive emulsion layer most adjacent thereto. The magnetic measuring devices are positioned on both sides of a central conductor or cavity, thereby enabling a central conductor to be inserted in such a way that one of three phases of the conductor system is formed. The

relationship value can be analyzed by comparison with baseline values correlated to exemplary collaborative relationships. The invention advantageously uses a decentralized scheduling hierarchy to regulate the distribution of bandwidth and buffering resources at multiple contention points in the switch, in accordance with the specified QoS requirements of the configured traffic flows. A second capacitor electrode may be formed over the first capacitor electrode.

1459828243-53351d23-a805-4d77-99b7-230b6fc51929

This invention relates to a sealing spring fasteners, which comprise one or more snapping engagement segments. The idler shaft assembly includes a shaft adapted for rotation about a first axis. In addition, a special design of longitudinal supports is provided. The upright members have a top frame that also pivots on the upright members. Specifically, various methods for the production of highly-pure bisphenol-A are disclosed in which an attached promoter ion exchange resin catalyst system is combined with a solvent crystallization step.

1459828243-d4d96fee-4e86-48f8-a357-846d01c8ebfb

A demodulation circuit for CDMA mobile communications systems includes a path comparison portion that detects whether one and the same path has been successively detected or not, and a calculation portion that calculates the timing variation between currently detected path and previously detected path when one and the same path is detected successively. Triallyl isocyanurate of the present invention comprises an organic chlorine compound represented by the following general formula in an amount of not more than 100 ppm: wherein R1 and R2 are respectively a chlorine atom or an allyloxy group with the proviso that at least one of R1 and R2 is a chlorine atom. In particular, the distributed data can be used for example, to track the progress of a chemical pill or also track the location of different types of borehole fluids, and also to determine the hole size or volume of the borehole. The method further includes using the first and second run-outs to adjust measurements of the inspection system. The content key can be generated from polar coordinates of the unique player ID, player manufacturer, and song genre.

1459828243-df7f77e4-ee4e-4371-9a00-87055694d7be

A decorative lighting network, which provides greater degree of illumination per foot or square foot of wire used to form the network. A second MOS-on-NWELL device is formed on the substrate and has its pickup terminals optionally connected together. Further, the energy of the tone or voice signals are determined at specific frequencies utilizing a Goertzel Filter process. Finally, testcase generation code is executed to generate a testcase. The described method is particularly useful for forming display structures.

1459828243-ea60e3c1-956c-4985-b6e5-53e168d29906

Disclosed herein is a pharmaceutical composition comprising ethyl)-2-methylphenyl)methanol and methods of using the composition to treat chronic pain. A guard is slidable on the syringe, has a proximal end, a distal end, and is biased from a first position wherein the needle is exposed toward a second position wherein the guard covers the needle. The method for super-resolving a single image comprises three stages. The apparatus preferably uses the fast marching method for the triangulated domain to obtain the geodesic distances.

1459828244-c4e889ba-0a32-40c0-be2a-5c80135bf9b1

The present invention provides methods and systems for determining anticipated profit from facilities such as electrical power generation facilities, for determining values for assets based on profitability of facilities, and for determining optimal operational scheduling options for facilities. An inquiry scan cache and a page scan cache are maintained. The three metal layers of the column comprise, in succession when proceeding from the layer that is in contact with the barrier layer, a layer of pillar metal, a layer of under bump metal and a layer of solder metal.

1459828244-d4583d67-7c2e-4ef2-9c31-4b803a33e5eb

A sample and hold circuit includes an op-amp, inverting-side capacitors, and non-inverting-side capacitors paired with the inverting-side capacitors. A protrusion is located between the topmost watermelon mill and the next threaded joint uphole. A communication protocol configures the system for communication and control protocols configure the system as one of a selection of intelligent appliance controllers. Movement of the hand grips moves the user support structure disposed adjacent the horizontal surface upwardly from the horizontal surface enabling the user to resist such movement and manually resist a return movement by the supported weight of the user on the user support structure. The hardware model is designed to emulate a micro-controller.

1459828245-02ecc1bd-6fd6-4360-96b3-e385be9ff073

A security system for shipping containers transported onboard a vessel detects intrusions into the containers and transmits a security message to a land-based security monitoring station that identifies the container and the current geographic location of the vessel. The system may include a container server, associated with a first source, the container server identifying a first module for use with a container document, receiving a module specification associated with the first module from a second source, and serving the container document with module data based on the module specification. Then, the home agent advertises path information to this mobile network only when the mobile router connecting to the mobile network does not exist. Another embodiment of the invention is a method of lifting a person using a personal transport device. The presence of a preamble is verified if the value in the correlation vector exceeds a predetermined threshold.

1459828245-278fed4c-a0f0-4603-ab74-ec1f723c373e

An electrical circuit protection system provides circuit protection in an electrical power distribution system. The present invention includes a network interface 110 that couples the network controller 120 to the audio network distribution system 20. The directly extruded molding has a predetermined external dimension, irrespective of the external dimension of the panel. Loadable conversion modules are provided for converting application specific formats due to the potential large number of such formats which can be encountered. The information is subsequently sent to the host controller on a periodic basis. 04 to 100 milliliter with a polar monomer having a concentration therein of 0.

1459828245-bcd3cfc7-be00-4754-96d4-306800dd3535

A method and system is proposed for use by a moving station for radar tracking of a moving target. A method for filling a hopper using the loading apparatus of this invention is also disclosed. The physical markings include characters-of-interest. A time-delay circuit disables the square wave oscillator, without interrupting the DC power supplied to the oscillator, upon the passage of a predetermined period of time from power-up of the AC power. Leading edges are formed where the first sides join the connecting sides, and trailing edges are formed where the second sides join the connecting sides.

1459828246-3c49cce2-bd1b-4139-bc45-2a5c71ab7d31

Provided is a semiconductor device including, on the same semiconductor substrate, a transistor element, a capacitor, and a resistor. The difference  $h$  in depth of the recessed or projecting portion is set to. A copy of the selected video segment is transferred to one of a plurality of buffers. This enables one or more plugins within the framework to access the specified repository. A method of viewing an IFE device is also disclosed.

1459828246-673955ac-105b-47f7-bf2b-84e3f31ff7f4

A connector, being a connector where one portion of the housing protrudes, and where an electrical connection and mechanical fixation is achieved by the

protruding portion being housed within a recessed portion of an opposing connector. Each group includes a plurality of sequential sheets. The first metallic pad is disposed on the base material. Shadow digital certificates for establishing outer connections between WAN optimization modules and clients are generated in the form of certificate signing requests.

1459828246-ca7d58ec-dd92-41b7-a151-69ac49328d01

A computing apparatus is configured to operate under multiple operational policies. The cage member includes upper, lower, and side portions. Other embodiments include profile parameter refinement procedures using sensitivity analysis, a clustering approach, regression-based methods, localized fine-resolution refinement library method, iterative library refinement method, and other cost optimization or refinement algorithms, procedures, and methods.

1459828246-f9584c10-4ce9-47e7-ae88-0138537d7f24

A shellfish cracking device for cracking shellfish such as lobster and crabs is provided. A transfer facility on the old appliance is used to select the information to transfer. It provides the advantages as follows: it only monitors the electric performance, not the mechanical performance of a cable; it monitors the cable itself rather than a monitor material; it is applicable to all kinds of cables, including but not limited to a large-current cable; it does not introduce new cables; it is an on-line monitoring, i. The method further comprises, responsive to an occurrence of a predetermined event associated with the environment, using the mutation rate and the probabilistic mutation criteria to determine if the operating parameter value should mutate, and changing the operating parameter value in response to a determination that the operating parameter value should mutate. In some implementations, multiple output triangles within the input triangle are generated simultaneously by parallel processing.

1459828247-4b6d64b5-4bbe-45ea-8d46-9c5b867c3507

A NOR flash memory device comprises a memory cell adapted to store at least two bits of data. The method includes receiving a symbol, performing a channel estimation operation to generate a channel estimation result according to the symbol, performing a cross correlation operation on the channel estimation result and an initial channel estimation result to generate an operation result, and determining whether the condition of the transmission channel have changed or not. The whole wafer backside is then polished and a backside substrate, preferably of transparent material is juxtaposed to the backside of the wafer, such as with an adhesive or with a frame. The message is then delivered wherein the voice of the animated entity is modified throughout the message according to the voice emoticons. or above is excellent as a heating element and, at the same time, has an excellent capacity capable of adsorbing various gases.

1459828247-ad7b552e-d321-4b18-95b1-d8ce292ddb6

There is provided a pad set for a protective helmet. Shelters and other protective articles incorporating this laminate are also described. The presently disclosed compounds can include those of the formulas:andwhereinL1 and L2 are selected from the group consisting of:. No water is used and no waste water is produced.

1459828248-1a2120d1-8b36-4cab-a8ab-29e5134439a0

A Gurney Clamp, Detachable Equipment Stand and Associated Transport Cart is disclosed. The control system comprises a first line driver that has a control input that controls the physical layer quality at the first end. The drive and sense electrodes are additionally arranged to capacitively couple with each other. The resulting composition is preferably adapted for oral administration. The system can be operated in reverse to produce a multiplexed, interleaved data stream for wireless transmission. These features both enhance the structural integrity and the uniform unblemished appearance of the finished molded container.

1459828248-306dc591-c5f2-42cc-a6b3-b1ae5a912b3e

This invention provides for an apparatus and a method for operation of a cryogenic hydrogen storage system that contains a porous medium configured to adsorb hydrogen. For example, but without intending to limit the scope of claimed subject matter, a transceiver module may include the following: a module housing; a bail lever; an actuator; and a spring adjacent to the actuator. A support basket is disposed in the splicing area and extends longitudinally within the housing. An upstream portion of the connection flow path is formed integrally with the first housing, and a downstream portion of the connection flow path is formed integrally with the second housing. The family members further include six selectively engageable torque-transmitting mechanisms, which are engaged in combinations of two to establish seven forward speed ratios and one reverse speed ratio between an input shaft and an output shaft of a transmission. The seed has a geometry that includes a vertex capable of destabilizing an oxide film that forms at the interface between the seed and a molten metal during the casting process, and thereby promotes a continuous single-crystal grain growth and reduces grain misorientation defects that can initiate from the seed/metal interface.

1459828248-d4f3e388-7063-4367-b476-0f1745c198a7

A film-tail clamp, cut, and seal system for use in a wrapping apparatus for wrapping an associated item has an oval track vertically oriented and openable to move into and out of the associated item. The ultra low power dosimeter assembly may include a low power voltage source and a table circuit. The method can include providing a discussion forum and initiating a thread in the discussion forum and measuring a temporal proximity of postings between two or more users in the thread. Pellets fabricated from this material are dropped into the holder and onto the seed, so that they melt and react with the nitrogen atmosphere to form a nitride ceramic. The interface is configured to transport the packet between the dies.

1459828249-3420fc1c-fc6a-45bc-9895-96e23ce9fba0

The present invention has an object to provide a Raman amplifier, a WDM optical communication system and a method of controlling the Raman amplification, capable of optimizing amplification characteristics in response to a change of operating conditions of the system so that transmission quality of the WDM signal light can be maintained in good. The peripheral device is coupled to a host processing system through a data bus. A computer or processor electrically coupled to the NIRS device is also housed within an area or extension of the wagon. The RF circuit changes at least one of a gain and a phase of the incoming signal to generate a desired outgoing signal that passes through the three-port device to the antenna. The communication unit is configured to be located between the chassis and the first or second storage device.

1459828249-5203d7fb-ccab-4cb3-b35a-8b6a0b4b157f

A vehicle safety device includes a seat mounted within a passenger compartment of a vehicle and a seat position adjusting mechanism that allows the seat to move along an axis between a forward-most position and a rearward-most position. The interactive content component includes one or more applications, which provide instructions for organizing, formatting, and synchronizing the presentation of interactive objects to a user. Airtight and fluidtight hermetic fluid flow passages are formed between such members, by forming the first block member, the second block member, and the wire members together as an integral structure.

1459828249-72775a5a-ef6b-4419-adc4-c29df27ec993

A method for assessing color performance in a printing device, which is provided with color printing means for printing at least three primary color inks, comprises the steps of: . An assembly comprising the first metal material, the second metal material and the core is set in a pulse electric-current bonding unit to perform a pulse electric-current bonding process. The method and system can also be used to provide a physical geographic location for a device for non-emergency situations.

In still other embodiments, provided herein are methods of selectively antagonizing receptors such as, for example, the \u03b13\u03b24 nicotinic acetylcholine receptor using the compounds and compositions disclosed herein. The communications system also includes at least one loss concealment processor configured to perform packet loss concealment on the stream of information packets as the stream passes through an intermediate point within the packet switching network.

1459828249-d54a72d5-68f5-46ec-b8f6-bc7130df2f4b

A spool handling device for engaging and disengaging a spool having, a base, a spindle supported by the base and adapted to receive the spool, a latch assembly pivotally mounted relative to the base and including a latch for releasably securing the spool on the spindle, and an ejection arm for assisting in removal of the spool from the spindle. The present application uses a toroidal transformer to simplify a circuit and reduce the number of electronic parts used. The primary variable frequency drive is electrically connected to the motor and an AC power source.

1459828249-f48c4753-6070-4125-9886-2166ca566efd

There is disclosed an oscillator for generating a periodic signal, comprising a transistor and two electro-magnetically coupled inductors in positive feedback configuration, one of the inductors is connected to the drain or gate of the transistor, and the other being connected to the source to maintain the same phase of the two voltages at the two nodes. The housing further includes a heat transfer flow path radially defined between the first cavity and the partition wall, and a fin in fluid communication with the cavity housing the LED drivers. The described embodiments use ultrasonic elements for generating a mist composed of droplets and fog and the fog is drawn or pushed by an air stream towards a duct.

1459828249-f9519f4e-1ea3-46bd-a4f6-ea98ef226f15

An artificial snow skiing surface has a number of spaced-apart rigid projections extending from a base. It is determined, based at least in part on the criteria, at least voice-related information in storage to which the instruction applies; the voice-related information includes call audio data, a call transcript, and call metadata associated with a call. First, a first metal layer is formed on a substrate.

1459828250-3523cc99-8b0a-4104-bfae-4ddbc4cd6e7f

A positron emission tomography scanner is provided which uses information on the time-of-flight difference between annihilation radiations for image reconstruction. without requiring additional humidification systems or hydrating water is disclosed. Those groups are displayed to the user in a ranked list of selectable groups to permit selection of a group or document. The resulting silica polymer is used as a proton conducting material for electrochemical elements such as fuel cells, capacitors, and electrolytic cells. This causes the dispensing chamber to expel the beneficial agent through a subterranean delivery channel, such as a rigid hollow spike.

1459828250-3777a387-10ce-49d9-8ae2-9a1df5c5b9cc

A support system, a bracket assembly, and a damping member for use in supporting a rotating shaft. First, one or more data blocks are encoded and recorded sequentially, and it detects if a buffer under run occurs. A vibration-damping apparatus using the vibration-damping device is also disclosed. In this way, the operator of the online commerce site may prioritize server access per service level agreements based on a specific third party application and API function call. The resultant data is recorded as record data to a record medium.

1459828250-73b43273-0341-439c-8bda-bae5eafa4fd4

A semiconductor memory device is provided for minutely changing a refresh interval according to a detected temperature and thereby lowering its power consumption. In

addition, a base assembly including a set of feet is adapted to rest on a surface. A pair of arms is attached to the elongated member. A layout cell is used for fabricating the PTF resistor.

1459828251-48e4c2ca-b02e-49ff-988d-33fafa81c0b8

Certain aspects are directed to an intermodulation detection sub-system. The automated banking machine is operative to receive and display on a display device of the automated banking machine, electronic documents for the user. In addition, a method for preventing lamivudine resistant HBV mutation from occurring in a host is provided that includes administering a 2-L-2'-deoxynucleoside or its pharmaceutically acceptable salt, ester or prodrug. The write test is used to indicate an abnormal condition of a head. The gear train includes an output gear secured to a motor shaft of the motor and an input gear secured to the valve shaft at one end and directly meshing with the output gear.

1459828251-51c04109-f408-47cf-b488-3fff2698371b

The present invention provides novel aryl benzimidazole sulfonic acid esters and cosmetic compositions that employ the novel aryl benzimidazole sulfonic acid esters as sunscreens. The electronic direction system accounts for the tracked instances in which directions have been missed in handling provision of future directions. The electrode moves with the carriage, and is adapted to attract an electrically-charged ink droplet ejected from the nozzle but not landing on a medium. The majority of the noise generated by the frequency synthesizer is generated away from the centerline frequency and is easily filtered by narrowband filter.

1459828251-8d8a788a-6a00-4786-bb6a-58aa6db59c41

A compression assembly tool having multiple split bases for attaching connectors of different sizes to corresponding coaxial cables of different dimensions by compressing the connectors axially. The player can then choose to match the dealer's raise or fold. The antenna element includes a radiating element, a shorting element and a feeding element. Soybean seed, cells, plants, germplasm, breeding lines, varieties, and plant parts produced by these methods and/or derived from soybean variety XBP04002 are further provided. The radio bearer controller can process linked user plane radio bearers in relation to each other, for example by terminating all linked user plane radio bearers if a single radio bearer fails.

1459828251-fb03c904-1297-43f5-80f4-e57c143e1bc6

An implantable medical device such as an implantable pulse generator that includes EEG sensing for monitoring and treating neurological conditions, and leadless ECG sensing for monitoring cardiac signals. Pyrido3,4-bindoles are described, as are pharmaceutical compositions comprising the compounds and methods of using the compounds in a variety of therapeutic applications, including the treatment of a cognitive disorder, psychotic disorder, neurotransmitter-mediated disorder and/or a neuronal disorder. By harnessing a unique telescoping ability of MWNTs, one may controllably slide an inner nanotube core from its outer nanotube casing, effectively changing its length and thereby changing the tuning of its resonance frequency.

1459828252-19ba5705-3073-4865-bb4b-f889ac78c606

Chemical sensors for detecting the activity of a molecule or analyte of interest is provided. The method, apparatus, and system enable individual instruments or a surgical instrument tray containing several surgical instruments to be quickly and efficiently inventoried and tracked. One port connects with an input optical fiber, one port connects with the dynamic FBG, and the third port connects with an output optical fiber. The methods described herein for transferring heat from an equipment enclosure using an airflow generated by a fan of a UAV may be employed for UAVs having a variety of duct shapes, and having equipment enclosures inside the duct or in detachable equipment enclosures located on the duct of the UAV. The measuring probe is configured to measure the reduced flow rate within the flow restrictor

tube where the reduced flow rate is within the accuracy range. The variant antibodies are useful for treatment or prevention of conditions and diseases associated with A\u03b2, including Alzheimer's disease.

1459828252-dca91bfc-93a5-43f3-9f1d-ad71d37cabd2

A computer system is adapted for dynamic replacement of a hot swap controller card. The inks may be jetted from both thermal and piezo ink jet systems. The cell current flowing from the bit line to the ground terminal can be set large and the large static noise margin can be attained. Plasma is generated from the N<sub>2</sub> and H<sub>2</sub> gases and then activated to form an activated gas species. The onboard data monitoring system records important parameters concerning the internal and external environments of the container, particularly temperature information, as well as other significant events such as the number of times the container was opened during transit.

1459828253-3bea8989-eb5f-4997-9424-b9dfb8b545be

In a large scale integrated DRAM in pursuit of micro fabrication, data line-word line coupling capacitances are unbalanced between paired data lines. A gate electrode has a laminate structure. A number of common satellites providing GPS data to the host vehicle and the remote vehicle are determined.

1459828253-73b9e0b1-6005-4b57-9597-c6a559381dfa

Apparatus with a pneumatic or hydraulic or mechanical therapeutic catheter. The program method may include programming memory cells, connected with a selected row and the second bitlines, with multi-bit data; determining whether the selected row is the last row; and reprogramming programmed memory cells connected with the selected row being the last row and the first bitlines when the determination result is that the selected row is the last row. Genes of interest are cloned into the multiple cloning site of the Vector System just downstream of the p26 or alpha crystallin type protein and a thrombin cleavage site. % Cr based on the total weight of the metal M, and \u03b4 is a top layer formed on the surface of the chromium-enriched oxide \u03b5, comprising sulfide, oxide, oxysulfide, and mixtures thereof. The package structure for the semiconductor has a substrate, an external frame device and a polymer filler. The invention also includes a method for purifying the non-ionic contrast agents.

1459828253-7ae57e3e-ce89-4a6f-bc9c-19a54ed777e6

Methods and systems are described herein for an article of manufacture for use in a weapon sight wherein the article of manufacture comprises a passively charged photoluminescent material. In one example, the device periodically measures transthoracic admittance values. In the method, a polyamic acid solution is prepared in which at least one metallic compound selected from a metal oxide and a metal carbonate is dispersed; the polyamic acid solution thus prepared is formed into a film and then is imidized to form a polyimide film including the metallic compound; and then the polyimide film thus formed is baked to form the carbon material. The control board is disposed in the control box. According to the invention, a simplified operation of the clamping device may be achieved, whereby the releasing unit may be operated by an electrical actuator.

1459828253-8d84d051-ce6f-4907-944b-ee0065dc1ac3

A method and system can locate an RF transponder based on phase differences between signals transmitted to the RF transponder. The ladder includes a rotatable base having storage space to hold extra rungs supporting the variable extended positions of the ladder. In one embodiment, a method of reducing the concentration of water in a Fischer-Tropsch reactor containing a water-rich hydrocarbon product includes removing water from the water-rich hydrocarbon product of the reactor by a water removal means so as to form a water-reduced hydrocarbon product and returning that product to the reactor. At least part of the alkali earth metal soap is a stearate and at least part of the zinc soap is zinc laurate. If a candidate direction is

verified as being a preferred direction, then a direction-fine tuning process is performed in which vector norm values associated with big angles from the vertical direction are calculated in order to find a more accurate direction for the non-vertical edge. The compressed air is expanded and accelerated by a series of diffusers and then impinges upon at least one impulse-type turbine bucket member located on the tip of a turbine blade to drive the turbine, which drives a compressor to start engine.

1459828253-d4474fb8-f360-4388-94b4-90029358ac94

A pavement marker includes a base and at least one lens with retroreflective areas aligned to reflect headlights back toward a vehicle for producing a nighttime signal. One embodiment of the invention combines a stuffer horn with spray nozzles for the application of a safety intervention solution while the product is being placed into a bag. In another embodiment, the method comprises obtaining megestrol acetate from a container associated with published material providing information is metabolized by a cytochrome p450 siozyme. , vaccines, comprising PMP polypeptides or PMP-derived polypeptides or antibodies thereto. In one embodiment, the verifying party verifies the integrity of the message M using the signature S, the public key N and the value q and the test equation  $M=S^2u^{2212qN}$ .

1459828254-6110cc4b-2c46-4ea2-b58a-fc28d94a620f

A vernier adjustor for a conveyor system is provided. The method includes firstly detects a data size of a transfer data. Each of the sidewalls has a through hole, an upper sidewall and a lower sidewall.

1459828254-928dba56-3639-43d3-a67d-074b6ff90358

This invention is an information processing device such as a computer, as a host device, and a memory card as an external connection device to be connected to the host device. Separating the channels are ribs and conductors are mounted in the channels. The composition is of low elasticity, while also providing excellent heat resistance, adhesion, and workability.

1459828254-a19c733e-3bf3-4796-a849-96c1d1a8a3db

A method and compositions for inhibiting excessive scar formation and adhesions by administering to a patient in need thereof an effective amount of an angiogenesis inhibitor. The angled outer surface has a plurality of ribs extending from a first face to a second face of the nut. An incoherent integration circuit section performs an incoherent integration process on the I and Q enhanced integrated correlation values. If the decoding results of the new enrollment are acceptable, the new enrollment will be used for recognition; otherwise it will be rejected and discarded. During cutting of the bone, one or more guide members having opposite ends which are spaced apart by a distance less than the width of an implant may be utilized to guide movement of a cutting tool. The hologram also forms an interference pattern effective to minimize color shift that otherwise occurs in displayed images due to off axis projection, achieving a color shift between two and five for angles of incidence between about 0 and 30.

1459828254-fc2a5972-84f5-42c1-a0e4-df6307008434

A solid state ionizing radiation detector is provided, having an absorber within which, when in use, electrical charge is generated upon the absorption of ionizing radiation. The metadata records can conform to a standardized structural definition, and may be hierarchical. The image data of a frame is selected, out of the stored image data of the plurality of frames. As a result of using the distributed control authority of the present invention, a station may be freely subscribewithdraw tofrom the network. The datapath has data integrity checks and a recovery mode when an error condition is raised, allowing it to recover from most errors without creating new errors. When the document is no longer accessible at the link, the method replaces the document with a backup document as the representative document for the event.

1459828255-106bcf7f-9c25-4da9-a96f-740b5f9ce64f

A sliding mechanism used for an apparatus such as a portable device suppresses shaking between housing units in an opened state, closed state or on the way to opening/closing, during a time period of at least 5 minutes. The heater power control circuit dissipates a certain amount of heat as a part of the control process.

1459828255-12ca6712-69ce-4234-a889-8b740928e1d9

Cultures of cells immunoreactive for glial fibrillary acidic protein, as well as for the intermediate filament marker nestin were grown in a medium including epidermal growth factor and serum. The antifuse via structures comprising a substrate that having a first conductive wire therein. The chemical mechanical polishing pad provides effects of effectively controlling a flow of slurry during a polishing process, thereby achieving a stability in the polishing process in terms of a polishing rate, and achieving an enhancement in the planarization of a wafer.

1459828255-42045c2b-7370-433d-a878-67af41e6d8d7

A fuel injector injects fuel to generate an air-fuel mixture that is burnt in the engine, and a sensor detects an air-fuel ratio of the air-fuel mixture from an exhaust gas composition of the engine. An oxygen containing gas stream, such as air or an oxygen enriched gas stream, is supplied to the headspace of each stage, and a means for aerating the sludge in one or more of the tanks, tank segments or compartments is provided to enhance the transfer of oxygen from the gas headspace into the sludge liquid for use by bacteria in digestion of the sludge. In another aspect, automated prosody measurement algorithms are used in conjunction with speaker segmentation to extract emotional content of the speech of participants within a particular conversation, and speaker interactions and emotions are displayed in graphical form. The sub-scanning circuit turns ON only the constant current sources in the unit that is being scanned. Based on the meta-data, previous access habits of the user and optional user classifications, the client system selectively receives and/or stores the data files that are later broadcast by the server. The monolithic body includes a matrix phase and a plurality of particles disposed within the matrix phase.

1459828255-86e27bd5-50ff-4583-a4a8-eb2ee75d848c

An image scanning apparatus is capable of successively scanning a plurality of documents arranged on a document plate in an efficient manner by moving a sensor unit over the documents in a sub-scanning direction. Also proposed is a manufacturing method for the thin film MIM capacitors. This material is added on a BEOL metal layer or as an external coating on the finished silicon.

1459828255-de8c1e5c-06a2-44fe-a5a4-32e2a1edebce

Source code of a computer program is compiled by a compiler to generate object code. The dispensing section includes a device for adjusting a variable size cavity configured to adjust to various pill sizes. A mask layer is applied to the insulation layer. At a receiver, the multiplexed signal is despread into a plurality of despread channels.

1459828255-ef774ee1-72b7-4036-9694-c50b97c48743

The invention provides a flexible plastic formulation capable of being extruded, blow-molded, ethylene oxide and radiation sterilized. In one embodiment, the adjustable accessory comprises a frame including a movable platform for adjusting height of a container thereon, such as an oxygen bottle. A combinational logic circuit receives a control signal as input applied from outside the circuit onto a terminal operates to select one of the fusible elements as a function of a signal applied thereto.

1459828256-7d417390-b55d-4797-82c3-abc8e5e0a88e

An LDO with fast current limit includes P-type transistor, an error amplifier, an adjustable reference voltage circuit for generating an adjustable reference voltage, and an N-type transistor. The invention thus relates to the plants, seeds and tissue cultures of the variety CV215542, and to methods for producing a corn plant produced by crossing a corn plant of variety CV215542 with itself or with another corn plant, such as a plant of another variety. The browser downloads executable code. Moreover, the invention relates to pharmaceutical compositions comprising one of more Fc-heterodimeric proteins or polypeptides.

1459828256-de05fda1-04f4-43ba-9518-949412dc4d7e

In an improved CPU base cover turning component, a CPU socket thereof includes a CPU socket base, CPU base cover, and a CPU base cover turning component. Semiconductor devices are formed in a semiconductor layer of the membrane. The communications receiver may be separate from a tag detection receiver.

1459828257-5413da42-d903-4410-8d43-7e8ca5200cf2

There are described personal care compositions containing a) one or more dibenzoylmethane sunscreens; and b) a photostabilising amount of a salicylate ester of formula :  $\text{Ph}-\text{CH}(\text{O}^-\text{R})-\text{CH}_2-\text{O}-\text{R}$ , wherein R represents an alkyl group consisting of a chain of from 7 to 16 carbon atoms substituted by at least one group selected from methyl and ethyl. The exposure devices project patterns of first to nth masks onto respective ones of first to nth substrates that are to be exposed. In addition, a regeneration circuit amplifies the changed output voltage at the time. The near-instantaneous creation of a logical version of the filesystem requires inserting a unique epoch number entry in the version table and the next epoch number to the new logical version.

1459828257-92e2c8dc-ae90-4fe7-90d2-188a2967b4a0

Provided are a marker for determining sensitivity to an anticancer agent capable of distinguishing a therapeutic response of an individual patient and a novel means for a cancer therapy using the marker. In some embodiments, the adjustable last includes an inflatable member that can be filled with fluid according to the size of the article, and may be used to adjust the size of the article. The radiolucent support member has a rigidity sufficient to support an upper torso and head of a patient.

1459828257-cda6b61b-b51c-4f99-b06d-000c49b2517e

Embodiments of a method of performing Huffman decoding are disclosed. The cooling apparatus includes at least one printed circuit board having opposed major surfaces, and at least one electrical component or other heat source positioned on one major surface of the printed circuit board. A query that uses search terms unrecognized by the then extant taxonomy triggers a series of operations that test the new terms and updates the taxonomy as appropriate. The soldering portions are inserted into the insertion slots and abut against the resisting surfaces. Alternatively, the operating condition is, while the inverter is on-line or in operation, transferred from the inverter control to an insulation monitoring system for improving the quality of the monitoring.

1459828258-50bfdb24-3a4d-4c32-bfe9-f8bd588cfe5f

A socket connector having a connector body co-molded with its peripheral and cable seals. In recording data related to a content by dividing and recording the data in a plurality of sectors continuously, dummy data to be used for extracting a clock in PLL for data reproduction is recorded on a region adjacent before a sector from which data recording is started. In particular, the paint composition is useful for forming a resin layer on sliding surfaces that contains the surface-modified fluoro-resin powder and heat-resistant resin for enhancing sliding properties of these surfaces. The top ends of the opposing sidewall portions are connected to each other by a scoop portion that has a non-skid surface formed thereon for gripping the lacrosse ball. Management of the coordinated operations of the

application programs avoids problems concerning information security, where valuable information may be distributed unexpectedly because of operations of low reliable application programs.

1459828258-dee3c03f-2a68-43b5-a1cc-da365ae63e19

An integrated circuit device with a bonding surface directly over its active circuitry, and a method of making such integrated circuits. The bonding leads of a stack form ohmic transitions in their boundary layers. The cage includes indenters for offsetting some of the blocks in order to form aesthetically pleasing grooving along the finished column. The first set has a smaller capacitance than the second set. A hyper-text link is associated with each device button, wherein the hyper-text link provides a link to an HTML page that is contained on the home device that is associated with the device button, and the device link page is displayed on a browser based home device. Upon subsequently receiving a request at the KDC from a client that desires to communicate with the server, the system produces a session key to be used in communications between the client and server, and then creates a ticket to the server by encrypting an identifier for the client and the session key with the temporary secret key for the server.

1459828259-0836ebe6-4aeb-419f-9288-c90871dc996b

A method is provided for controlling point-to-multipoint communications. The capacitance cell also includes a capacitance composed of a first electrode, a dielectric member and a second electrode stacked together, and is formed in a frame shape and disposed in a space between the substrate structure layer and the interconnect layer so as to extend along an outer rim of the frame shape of a standard cell region in which a standard cell is arranged. Further, when printing of a plurality of images is set, if a continuous printing determining portion determines that continuous printing is possible based on a limit on an image size relative to a RAM capacity, an image associating portion associates images that are in the number that can continuously be printed. The substrate is etched using the patterned masking layer to produce a template. The source regions of the column of memory cells are electrically coupled to the trench line on one side of the column of memory cells via one of the polysilicon inserts.

1459828259-7f9bbf9f-9827-4e0a-a7d5-3b942822cd61

A barrier for stopping unwanted watercraft and subsurface intruders from entering into a port or off-shore structure is provided. The Power Management Unit has no arithmetic circuit. The server validates that the sender of the validation-message is a valid client-receiver of the subscriber television system using an authentication-token and a validator that is known to both the server and to at least one of the client-receivers. Ladder rung hooks are attached to a first bracket, which receives and is pivotally attached to the main member and has one of the hooks attached to each opposing end of the first bracket. The mounting substrate is provided on the other side thereof with external connection terminals connected to the chip connection terminals and the ground terminals and used to mount the mounting substrate on an external substrate. A plurality of slotted strips and/or a drawer slide guide are mounted to the housing.

1459828260-22493ef8-3be0-4b89-a7d4-fedcb21e1514

A method and a system for managing a website are disclosed, the website being arranged on a server. The optical element is preferably adjustable in each of the X, Y, and Z axes to allow the wearer to optimize projection of the optical element. 20% and a chroma value  $C^*1_{u226715}$ , the antireflection coating of the second lens having a weakly colored residual reflection, a mean reflection factor  $Rm2_{u22661}$ .

1459828260-32f1024b-83bd-4756-b02a-055e7d412cc7

Apparatus and methods for separating fractions having monetary value from residual streams from a MRF are disclosed. Three types of devices having aerodynamic housings integrated to the trailing edge of an aerodynamic shape are presented,

which vary in details of how the control surface can move. The roaming subscriber is provided with a prepaid debit account. The footplate is used to enter Schlemm's canal, serves as a guide, and also protects Schlemm's canal. Accordingly, it is possible to maintain a constant flow rate.

1459828260-44186390-6c42-4f0a-a32b-7a740554a089

Disclosed is a semiconductor device whose reliability can be improved. Sets of scrambled binary values are received. The system complexity is therefore reduced without loss of performance. An apparatus for illuminating a surface is provided that includes an arrangement reflecting light toward the member that is positioned over the member and separated from the member by a gap, and an arrangement emitting light into the gap. A connection path is in fluid communication with the first chamber and the second chamber.

1459828260-b5c1176b-4689-40eb-bca5-83f5c18bd206

A head performs recording or reading information with respect to a sheet-shaped recording medium. The light source is in one of the focal regions and produces a pool of reflected light in the other focal region, and the lens converts this pool of light into a beam projected on the road. The rear electrically actuated brake circuit is controllable in response to the input for providing a frictional rear braking force. A disablement unit, coupled to the first and second modules, asserts the disable signal to the high frequency oscillator when all of the request signals are asserted, thereby forcing the high frequency oscillator to cease the generation of the first high frequency signal.

1459828261-41d5153e-534d-4076-abfe-9be605b8d9fe

A method and apparatus for using SONET technology to efficiently carry both data and voice traffic by AddDrop Multiplexing of both isochronous traffic, such as voice and video, and non-isochronous traffic, such as data, in a SONETSDH fiber-optic ring topology. The high-speed optical transmitter comprises the optical modulator which modulates and outputs an input light in accordance with an applied voltage, and a driver circuit which outputs the applied voltage into the optical modulator and has an emitter follower circuit at an output stage thereof. The method further includes galvanically applying layers to the uncovered partial areas of the second layer so that multi-layer strips are formed thereon and an electron-optical transparent structure is formed and removing the electron-optical transparent structure off the second layer. A pair of transistors in a row are separated by an oxide isolation region comprising a low dielectric constant oxide material. Apparatus for monitoring a process is also disclosed.

1459828261-d9b99945-c95b-4211-9942-586264716f34

To enhance electromigration resistance of an electrode. The device includes a first MISFET in which hafnium is added to the gate electrode side of a first gate insulation film including silicon oxynitride, and a second MISFET in which hafnium is added to the gate electrode side of a second gate insulation film including silicon oxynitride. A measurement circuit is adapted to measure impedance between the electrode and ground as the electrode approaches a target tissue. In one example, the substrate is provided with a tongue or a groove defined in any one, combination, or each of the respective side edges of the substrate, as desired.

1459828263-508a84ae-fe53-4f7b-a56a-07661838c5ee

A system for determining a configuration of print-related devices in a document environment may include a computing device and a computer-readable storage medium in communication with the computing device. The interactive program guide is preferably implemented using a microprocessor-controlled set-top box that is coupled to the viewer's television set. Charges attached to the material pattern are removed with at least one discharge gas. The circuit decreases the drive strength by which the power switch is driven during each output edge or high to low), and returns the drive strength to its normal level when the output edge is

complete or approximately complete. When the edge signal SE becomes the predetermined level, the charge-discharge control unit switches the charging state and the discharging state of the charge-discharge circuit. The additional component when adsorbed reduces the decomposition of ozone that would occur in the absence of the additional component adsorbed on the zeolite adsorbent.

1459828263-7a5459ca-ff50-4fde-9d5a-82f2996d4785

A waterproof structure is used with a printed circuit board, which is primarily composed of an upper layer membrane, a lower layer membrane, and an insulation layer, which are conjoined to one another. Embodiments of the present invention may be useful when grinding thermally sensitive materials such as gas turbine creep resistant alloys and hardened steels. The signals are transmitted from the metal detector to the operator who can then take appropriate steps to neutralize the IED.

1459828263-8a5c90e4-e2af-433d-8193-318e75e73040

A communications device in the form of a base station or communications node such as an eNodeB communications node selects one of a plurality of modulation and coding schemes for a control channel for a user communications device on the basis of the range which is specified by the location or channel condition within a cell of the user communications device. The thermal reservoir has a first plate and a second plate fixed to the first plate. The AF is completed by moving the lens unit to a position corresponding to a maximum edge value selected from among the detected edge values.

1459828263-d383a7d7-7c8d-49a4-8fdc-f34107b0d0ef

The present invention relates to a bone plating system and method for fracture fixation of bone. Also provided are assays utilizing flowable or fixed particle sets within a microfluidic system, as well as kits, apparatus and integrated systems comprising arrays and array members. The bicycle support apparatus can also be secured to any horizontal, vertical, or any angular face. 0001 to 20 parts by weight based on 100 parts by weight of the thermoplastic resin, and a polymer having an epoxy group was used as the organic polymer. The molded portion, formed of insulating resin, covers and blocks at least a boundary between the body and the cover, a boundary between the body and the connecting portion of the contact, and a boundary between the cover and the connecting portion of the contact. The output image has the same field of view as the input image, maintains image resolution, and limits distortion to levels that do not substantially affect the viewing experience.

1459828264-4c9900d5-69bc-4eda-862e-4709e2a90701

A system and method is disclosed for measuring muscle reflexes as a tool for identifying/ diagnosing dysfunctions non-invasively by using mechanical stimulation. The motor controller outputs digital representations of the pump motor operating parameters to the processor. The second connector includes a tab receiving terminal for electrical connection to the tab terminal and an elastic lock arm for sliding over the projection when the second connector is fitted into the first connector.

1459828264-63853b21-bcf8-486f-a06f-8974f65686ed

The present invention relates to a novel process for the preparation of 1-H-pyrrolidine-2,4-dione derivatives and to novel intermediates and to a process for their preparation. A start clutch transmitting and interrupting the power to the first shift clutch and the second shift clutch is constructed of a centrifugal clutch C having a clutch shoe. The ligands are easy to make, and they are readily incorporated into transition metal complexes, including those based on late transition metals. Also, the flexibility is increased with respect to wireless communication with the network or the Internet without any need for specialized equipment and functionality. The movable member is adapted to move relative to the ram in a second direction perpendicular to the first direction.

1459828264-e6a86203-6830-42c8-99ba-6870bbb93000

A method and apparatus utilizes a personal speech recognition system to enable data retrieval assistance operators to retrieve customer requested information from an information database based upon a voiced inquiry by the operator. A profile system is provided having multiple programmable profile settings and a default profile setting for the application. The antenna quality factor can be adjusted substantially independent of antenna gain to achieve an extended Chu-Harrington relation.

1459828265-69018cff-db51-4af9-b433-28c38d0e62fb

Coated articles are provided with an anti-reflection system which enables high visible transmission and/or low visible reflection. An image rejection mixer may be enabled to mix a plurality of generated local oscillator signals. The plasma has, near a surface of the quartz member, an electron temperature higher than or equal to about 2 eV. These proxies can also include the ability to share DNS answers between each other.

1459828265-e38ba0ef-7e9b-4f09-a9a9-aa967fda078c

A synergistic antimicrobial composition. Through a reserved line and a HPD line provided separately from a TMDs transmission line, an Ethernet signal is bidirectionally transmitted, and also, a SPDIF signal is transmitted from the sink device to the source device. The variable magnification optical system has a plurality of lens groups for performing magnification variation by changing intervals therebetween and a reflective surface for bending an optical axis.

1459828266-6f9678d6-4ef3-433a-b06a-f3f77719934d

Efficient implementations of wide logic functions in programmable ICs include carry chain multiplexers driven by dual-output programmable function generators. Specifically, the disclosed invention relates to methods to increase the stability and delivery efficiency of protein kinase C modulatory peptide compositions. First, the network must be immune to the failure of a single link.

1459828266-c8d93029-bbfd-41bf-bbbb-d3dee1162ffa

The present invention extends to methods, systems, computer program products, and data structures for decoupling an attachment from an electronic message that included the attachment. The method also comprises determining whether the sending system is in an unauthenticated mutually exclusive connection state. These data are then transmitted over special communications networks having very high coverage space but limited bandwidth. The charge reservoir is connected to the voltage supply to provide a current through the resistive element. A method of setting a packet transmission path includes setting N routing regions including at least one node between a source node and a destination node based on a predetermined N number of hops, N denoting an integer greater than or equal to two, and determining a node in each of the routing regions as a relay node based on a channel gain. The methods include coating colored particles in a compressed carrier fluid on the substrate of the dye-donor element.

1459828267-2fd1e0d9-2b96-490a-89f3-04df9295884e

A universal end cap and associated method are provided for rain gutter debris guards of the type having a top cap extending along a roof and over the open top of an associated gutter. The MIMO base station is configured to switch between a single-user -MIMO mode and a multiple-user -MIMO mode during communications with the plurality of MIMO UE devices based on multi-rank precoding matrix indicator feedback received from at least one of the MIMO UE devices. The PCB antenna is connected with a signal processing unit via the coaxial fed or the microstrip fed for transmitting the signal the PCB antenna received. The display unit displays for the calculated subcutaneous and visceral fat areas in a concentric circle format. One of the electrically conducting connection through the interconnection substrate is a grounding path for the power amplifier, while a thermal path is provided by

the semiconductor material.

1459828267-5b423e45-f29a-47f8-8e61-dba1d6c6a511

The present invention concerns a digital signal tuning apparatus which includes an offset frequency correction system. The device has a complex, three-dimensional structure in a relaxed configuration that may be used in the approximate shape of an anatomical cavity. The second grounding shield includes a second body portion and a second vertical portion extending from the second body portion in the first direction.

1459828267-716191b3-0432-445e-ab1b-c4958145b21c

A Radio Data System decoder circuit determines a subcarrier frequency utilizing only a 57 kHz RDS signal of an FM broadcast signal. The invention also relates to methods of treating hyperproliferative diseases by administering a retinoid X receptor agonist and an agent capable of activating protein kinase A. The latch is configured to engage the latch projection to move the first handle portion and the second handle portion toward one another. In response to the area determined using the SPS being remote from the area determined using the WLAN-PS, it is concluded that the one or more WLAN APs have been moved to be about the area determined using the SPS. A first set of rollers creates the primary and intermediate fin designs on at least one side of a board. In such embodiments, raised portions of the laminate corresponding to the non-adhesive regions and curled portions corresponding to the adhesive regions are visible.

1459828267-7a531b5e-7e76-48af-9e94-7b400a4079e0

A water treatment system may generally comprise a generally cylindrical halogenated resin bed comprising an empty bed contact time greater than 1 second, an aspect ratio less than 0. The irregularly-shaped side panel is first divided into two segments with a single straight line to define an inflation segment and an impact segment. The transportation unit transports plural conveyance receptacles in a sequential manner. A basic pattern adjustment unit 26 adjusts the coefficient of  $P_{u2032hij}$  to generate  $P_{u2032hij1}$  to  $P_{u2032hijn}$ .

1459828267-81ed1aa4-1191-479a-b349-d31947122e6e

The negative electrode or anode for a secondary electrochemical cell comprising a mixture of graphite or hairy carbon and a lithiated metal oxide, a lithiated mixed metal oxide or a lithiated metal sulfide, and preferably a lithiated metal vanadium oxide, is described. A storage managing server contains a policy definition file, a scenario definition file, a priority definition file, an execution result value file, a feedback definition file, and a scenario parameter definition file, and also obtains performance information and executes scenarios.  $0\text{ mCcm}^2$  in terms of electricity necessary for reduction and tin phosphate in an amount of 0. The filter cartridge includes a first end that electrically connects the filter cartridge to the telephone and a second end that faces outwards. The message is modified to present a health alert indicator by appending supplemental content to the message or by amending the content. More particularly, the present invention relates to the use of the synthetic receptors for delivering a protein, peptide, drug, prodrug, lipid, nucleic acid, carbohydrate or small molecule into a target cell via receptor-mediated endocytosis.

1459828268-c3616567-c57f-4707-8a8d-a1941f24ce2d

A wheel chart having at least one rigid disk formed by a compact disk which, in addition to having a mirrored or reflective layer capable of carrying reproducible information, has legible matter on an obverse side which cooperates with a member such as a transparent rigid disk which can also bear indicia to enable calculations to be made by relative rotation of the disks. A similarity value of a multimedia object to an object of interest is computed based on the attribute weights. Both sides then fold up to trap the charcoal in the middle of the grate.

1459828269-1af853ad-727b-4d2a-b6a3-381c9ee6b92e

The present invention provides a pharmaceutical composition which is useful as a phosphatidylinositol 3 kinase inhibitor and an antitumor agent, and it provides a novel bicyclic or tricyclic fused heteroaryl derivative or a salt thereof which possesses an excellent PI3K inhibiting activity and cancer cell growth inhibiting activity. The latter is provided with an annular thickening extending radially and axially, the said thickening being delimited by corresponding axial end stops and being force-fitted into the said channel. In this manner the MEMS Fabry-Perot array serves as a spectral filter of light passing through the Fabry-Perot array to the photodetector array. The first and second C-shaped bodies are coupled together forming an enclosure. 5 wt % of 1-hexene derived units, the sum of the amounts of propylene, ethylene and 1-. Doing so may improve application performance on a computer system configured using a non-uniform memory access architecture.

1459828269-2f848b63-acba-406a-8c5c-e3355434657e

The invention relates to a method and a device for the complete correction of sight defects in the human eye. An electrooptic element is disposed to convert an electrical signal from the microelectronic package to an optical signal for transmission to the coupler and waveguide, and/or to receive an optical signal and convert it to an electrical signal for transmission to the microelectronic package. The X-coordinates being in the tangential direction, the Y-coordinates being in the axial direction and the Z-coordinates being in the radial direction.

1459828269-906ce02b-d5e1-41c8-9b22-af6de302d831

A gain structure of an LED tubular lamp for uniforming light and dissipating heat is disclosed. A nozzle can be positioned at the first end of the drying chamber and be configured to atomize liquid and spray the atomized liquid into the interior of the drying chamber at a maximum spray pattern angle relative to the center axis. An identification of the tile module is input.

1459828269-b0de638e-4ec5-4b3d-aeb0-584a505af4fd

A liquid infusion and/or brewing process is described. The door is affixed to the exterior surface of the rotary kiln and includes a hatch pivotally secured at one side edge thereof by a pivot rod to a frame. The formulated paste is inert to cement embedment material and is pre-coated on the anode body prior to encapsulation.

1459828269-c4a3762d-d88d-4452-9d9c-1846b7c66743

A restraint system that evaluates factors such as the type of collision an automotive vehicle is experiencing and then, based on that evaluation, deploys a knee airbag and/or a head/torso airbag. In the preferred embodiment, M is an Aazta metal chelator or a derivative thereof. The pipe extends in the axial direction of an inner tube having such flexibility as a cloth, is smaller in the diameter, shorter and higher in rigidity than the inner tube. The invention further relates to a diverter strip with isolated segments of concave shapes being advantageous because of the good connection between the segments and the non-conductive material. An application forms a video that shows a turn at an intersection from a first road onto a second road. The methods and structures are directed to time-division duplex systems, and are particularly suited to those that incorporate orthogonal frequency division multiplexing.

1459828269-f6508d3f-50a2-437b-8385-6c41d6be0cb8

An apparatus comprising a full system monitor. The die provides a matched load to the drive circuit by also having a balancing load with an impedance, including both resistive and reactive components substantially identical to the load impedance of the semiconductor laser fabricated on the die. This invention advantageously reflects effectively and comprehensively the circular uniformity of the contact holes. The primary and secondary revolving members may be spherically or cylindrically shaped, independently.

1459828270-4a5b3016-498c-402e-99d3-207ab7bee549

A home entertainment network includes at least one client device connected to a server over a network, and the client has an interface to removable media. In particular, the polyester fabric has improved resistance to edge combing. The relative tendency of a fabric to pull apart under seam stress or similar action such as inflation of inflatable restraints. A plurality of portions of the construct may be interconnected using locations and paths determined and navigated with the navigation system. An activation operably coupled to the electrical control circuit to activate the vacuum pump when saliva is to be collected from the user's mouth. The support may include a temporary tank, pre-filled with powder and provided with an opening for discharging the powder towards the anode on the support.

1459828270-96c9f3bd-1e9e-4900-be5e-84cb0050b190

A floatable boat ramp is disclosed including a plurality of hollow planks arranged parallel to one another such that the upper surfaces thereof define a drivable surface. The mounting plate has the fixing device including at least one first groove with an approximately C-shaped cross-section, which extends in a linear manner in the extension direction of the mounting plate. Tertiary treatment can alternately or additionally be achieved in the bioreactor with nitrification of ammonia, with nitrification and denitrification, and with nitrification, denitrification, and chemical phosphorus removal. Accordingly, increase in current passing through the voltage-up converter caused by variation in the voltage command can be suppressed. Thus, a display device according to the invention has two functions of an image sensor function to read information of a subject by using an imaging device and a display function to display an image by using the imaging device and the light-emitting element.

1459828270-a503c0c1-ea63-4587-939d-36a161fa9cf1

An operator restraint system is provided. The devices encompass an on-line hardware pipelining architecture to support 3D translation, normalization, and weighted histogramming as required. The electrical conducting material is a sulfide having electronic conduction, and the electrode active material is a sulfide of an element which undergoes the alloying reaction with lithium. The method comprises the steps of adding an organotrialkoxysilane to water for hydrolysis, and adding spherical fine silicone elastomer particles having a volume average particle size of 0.

1459828271-3df98eff-09df-4b0c-b2b8-ab91dbf4eebb

A rebar installation system that uses rebar drive stations to secure rebar against the inner surface of a coil for securing thereto. A parabolic reflection vessel in the heater housing is separated from the parabolic lamp vessel by a convex lens. In the event of a tensile load, the expander enters the spacing element and forms a deformation zone that corresponds to the length of the spacing element. The target memory block may thus be initialized without the cache memory holding a valid copy of the target memory block. The rod and internal piece may be rotated for variability substantially in a plane, and a set screw is threaded into the receiving portion to lock the rod within the receiving portion.

1459828271-4e1d51fd-799d-46bd-846c-5e68b03194db

Methods for providing a SAM coating on a slider and subsequently removing a portion of the SAM coating. A joining structure is installed between the elbow pipe and the straight pipe so as to allow the elbow pipe and the straight pipe to turn through a predetermined angle relative to each other only when the elbow pipe is forced to turn and further to keep them in a turned position while the elbow pipe is unforced. To reduce complexity, the forward recursion incorporates the techniques of delayed decision feedback sequence estimation to construct a reduced state space. In a case where detailed guidance is necessary, the screen is switched to a detailed maintenance screen. The photodiode is positioned to receive laser light at

the first order diffraction and provide a signal indicative of the magnitude of the first order diffraction laser light produced by the AOM. This invention also includes the method of making this rubber cement composition and of using this adhesive to bond to surfaces together.

1459828271-d8a3d89e-6f3e-4e08-8b60-e2ad6160d34a

A Fiber-wireless uplink consists of a wireless channel followed by a radio-over-fiber link. Then, by fitting together an engaging hook, a projecting hook, and peripheral edges of a visor cover and the visor rim, the visor rim and the visor cover are assembled. The variable-volume lens includes a lens film, an accommodation space wrapped by the lens film, and a transparent fluid within the accommodation space. A charge delay register is included in the event-driven X-ray CCD imager device to enable recovery of the charge packets from neighboring pixels for accurate measurement.

1459828272-9e709efb-7858-4544-8584-2ce873a0c7ee

In a device for measuring angular positions by using radar pulses and mutually overlapping beam characteristics of at least two antenna elements, a switchable phase shifter is provided in the signal path of at least one antenna element which is switchable in the time-division multiplexing between different phase states. When mail is added to the mail receiving receptacle the machine conveys only the mail for one address to the mail delivery receptacle and then stops until the mail delivery receptacle is clear. The system stalls the returned behavioural characteristics from the second model in a memo table and when a sufficient number of these have been returned with sufficiently little variation between them, then they are marked as being valid for use in place of a call to the second model, thus speeding up modelling. This top layer is thick, without sacrificing resistance to delamination, particularly at brazing conditions. The method results in a large area of the semipolar N thin films, heterostructures, and devices being parallel to the substrate surface.

1459828272-c2b0f227-45a0-4588-88f4-ccfc2d02973e

According to one embodiment, a client system supported by remote maintenance in an electronic network configured to serve a plurality of clients may include an electronic network, a plurality of storage resources, a first virtual machine, a second virtual machine, and a virtual machine manager. The image reading unit reads images of a plurality of documents and generates read image data of the plurality of documents. The second communication node then estimates an offered bit rate for the communication device within the second cell of the second communication node based on at least one parameter of the second cell. Searches proceed against a first tree, while the second tree is used for performing updates. Since a horizontalvertical placement change-over switch is operated in accordance with the horizontalvertical placement of the cabinet, a video image can be projected correctly onto a screen regardless of the horizontalvertical placement of the cabinet.

1459828272-d250520e-8bfa-4921-99de-c9b574367e23

Embodiments of the present invention relate to a method. The purpose of the handle bar is to provide a safety mechanism for kids to hold on to while sitting in the saddle and riding. A segmented lens can be used to create multiple focal points simultaneously. The system may have a sensor for detecting presence of the person and for initiating operation of the source of penetrating radiation in response thereto. The operation of statistical estimation of the second gain value includes evaluating a threshold value as a function of the desired image parameters and setting to zero a percentage of coefficients of the first quantized data as a function of the threshold value. The pickets are preferably characterized by a W-shaped profile, and preferably include longitudinal strengthening ribs.

1459828272-f64f4fc7-d313-4924-9ebe-3863f6a42070

A method for controlling the supply of liquid to an aerosol generator comprises operating a liquid supply system to supply a liquid to a vibratable aperture plate of an aerosol generator which senses an amount of liquid adhering to the vibratable aperture plate, and controls operation of the liquid supply system to adjust the amount of liquid adhering to the vibratable aperture plate. Therefore, there is realized an optical system capable of effectively correcting chromatic aberration while having a structure in which a manufacturing cost is low and an environmental resistance is high. A photosensitive pattern is formed over the anti-reflective coating layer. The polybenzoxazole-based mixed matrix membranes of the present invention can be fabricated into any convenient geometry such as flat sheet, tube, hollow fiber, or thin film composite. The projection screen has structure constructed and arranged to selectively reflect only incident optical energy of a predetermined number of narrow bands of optical wavelength regions.

1459828273-7127124b-efbd-42bf-b289-6712d436d216

An assembly for holding or supporting a timepiece balance spring includes a balance spring stud and a stud-holder. Anti-radiation homing antennas and down conversion elements are added to the missile and coupled to existing signal-processing hardware. In addition, the invention maintains a searchable text file to allow a user to find desired subject matter within the presentation, and to display the corresponding screen. A ring-like manifold passes through the interior of the pillow and communicates with each compartment. The buttress is generally circular in shape with an outer diameter sized to coincide with the outer diameter of the stapler body staple compression surface and the outer diameter of the anvil compression surface of a circular stapler with which it is used. The wire grid polarizer patterns on each of the first and second sheet are mechanically translatable relative to each other, wherein the mechanical translation controls transmission of light through the light transmissive panel.

1459828273-73764d95-e1d0-4e7d-b431-9f2779fe65b3

A silica powder surface-treated with and epoxy compound having a plurality of epoxy groups, in which at least one epoxy group of the epoxy compound is ring-opened to bind to the surface of the silica powder and at least a portion of the remaining epoxy groups of the epoxy compound are bonded to amine compounds. The device communicates with the reader in order to determine the security of the container to which the device is attached. Corresponding sets of cards are disclosed. For example, if one of the input descriptions and output descriptions is scrolled, the other descriptions may be automatically scrolled. The cleansed oxidant stream is then delivered to the hydrogen processor and to the fuel cell assembly, with minimal inclusion of detrimental contaminants such as sulfur. A host computer receives from a client computer, a device name that includes as part of the device name at least a wildcard character.

1459828273-f8ee95bc-4be7-4444-94cf-db0420d998b4

A method to operate an electronic controlled internal combustion engine with an electronic controller having memory and tables resident therein to obtain and use sensor data beyond the Nyquist threshold. An intake air duct draws outside air into the engine compartment. The second lens group includes a negative lens, a first positive lens, and a second positive lens, and the optical system includes a compound type aspherical lens constructed by a glass material and a resin material. The heater may be located downstream of a gas turbine engine that cogenerates electricity and provides the oxygen-containing gas.

1459828274-5171bfec-8e5d-4631-af69-3c081457dee8

A drive axle assembly includes a non-rotating spindle having a cylindrical body defining an internal cavity and an axle shaft assembly mounted within the internal cavity for rotation about an axis. The substrate comprises an inner layer conductor and a cavity comprising the bottom surface on which a part of the inner layer conductor is exposed. A special bar code is described that has additional

information, but can be read by other readers.

1459828274-6243853d-7de7-450e-8854-82bab9d29c1e

A continuous dyeing device and related processes using indigo and/or other colorants for warp yarn chains and/or for fabrics, equipped with at least a first and a second dyeing compartments containing dyeing baths, the first and second dyeing compartments being enclosed, at least partially, in a hermetically sealed chamber. A cantilever is formed on the single crystal silicon substrate, and the thickness of the cantilever in a direction parallel to the surface of the single crystal silicon substrate is made smaller than the thickness of the cantilever in the direction of the depth of the single crystal silicon substrate, and movable in a direction parallel to the substrate surface. A total of products of  $C_n$  and  $W_n$  satisfies a numerical formula:  $\sum_{n=1}^N C_n W_n \geq 1$  where  $C_n$  and  $W_n$  denote respectively a photoelastic coefficient and a volume fraction of each polymer material, and at least one of the polymer materials of the film has a photoelastic coefficient value of at least  $60 \times 10^{-11}$  cm<sup>2</sup>/N. Thus, the intake air temperature correction retardation amount  $\Delta T_{air}$  is set to an intake air temperature correction retardation amount  $\Delta T_{air,off}$  for the time when EGR is off, which corresponds to the intake air temperature  $T_{Ha}$  and the engine load  $KL$ . Transferring the data may also include, in response to the  $wpmode$  flag being set, transferring additional data from the local storage device to the remote storage device. The two-stroke engine has a transverse plane dividing the cylinder in a direction of the longitudinal cylinder axis.

1459828274-b62cf4d4-e420-4056-b531-344515321192

A method of the present invention is used to control a flying height of a head operable to read data from and write data to a disk of a recording medium housed in an enclosure. The block-histogram calculation unit 113 calculates the number of pixels, as a block histogram, included in each of luminance blocks which are obtained by dividing a luminance image in a spatial direction and a luminance direction. The system includes one or more presentation applications, each presentation application operable to provide a presentation output and a plurality of augmentation and presentation control modules operable to provide user augmentations of the presentation output. The 15 is a plate shape member for reflecting the light outputted from the 13 and for transmitting the light to the 11, that the light from the 11 permeate. Filter positioning means are provided for supporting and positioning the hollow cylindrical filter element.

1459828275-48a29fec-9b3a-4c0d-be79-d8db47816e2d

A water diverter assembly is positionable in a skimmer chamber between a well and a pool. An oxide film is formed on the surface of a silicon substrate having a 100 face. The inclusions function as crack initiators during the fabrication process as well as crack arrestors preventing the propagation of the cracks farther into the matrix material. A gate ARC layer is formed over the gate layer.

1459828275-8b8f404a-0945-4dff-b58d-b5af80c3b69b

A touch panel includes a substrate, a first adhesive layer stacked on the substrate, a first conductive layer stacked on the first adhesive layer and having a first electrode pattern, a second adhesive layer stacked on the first adhesive layer and the first conductive layer, and a second conductive layer stacked on the second adhesive layer and having a second electrode pattern. The signals are rectified and voltage multiplied, and the resultant DC voltage is provided to a power management circuit. The shaft may be positioned proximate the surface. The layer of superconductive YBCO material is thereupon applied all around, and the heat treatment is finally carried out. A magnet having  $2n$  poles is mounted on the base, and rotates the hub using electromagnetic force between the magnet and the coil. The light-altering component is positioned relative to the mounting apparatus for receiving and altering light from the first light source when the first light source is engaged with the first fixture such that the altered light illuminates at

least a portion of the room with thematic light.

1459828275-9e39c371-2e8d-46f8-88e8-46a7998c9488

The invention relates to a new process for producing useful intermediates for the manufacture of NEP inhibitors or prodrugs thereof, in particular NEP inhibitors comprising a g-amino-d-biphenyl-a-methylalkanoic acid, or acid ester, backbone, such as N----4-amino--methyl butanoic acid ethyl ester or salt thereof. A category structure may be accessed. An electromagnetic network provided to couple the first and the second oscillators includes a transformer with a primary circuit and a secondary circuit. In addition, the shape of the cover allows for good accommodation of the fender. This allows increase in the number of semiconductor chips producible per semiconductor wafer, resulting in reduced manufacturing cost thereof.

1459828276-0937a65d-0f55-429a-aa0e-43bd4a14474e

A non-fouling, bypass filter is disclosed. Specifically, there is disclosed a memory having a plurality of columns of memory cells, with each column of memory cells being coupled to a bit or data line. A floor of the multi-story building is formed by arranging the modular units so that the slab of a first modular unit is positioned on the receiving lip of a second modular unit.

1459828276-13924a79-0a7c-4b36-8348-ce407c77d9db

The invention provides a gas insulated switchgear, and a method for detecting arc damage in a part used in a gas insulated switchgear, which detect directly when an electric contact or a peripheral part reaches an initially set wear limit. Each of the p type layers is separated from each of the n type layers by one of the intrinsic layers. When a request to establish a connection is received directed to a graylisted address, the connection is permitted to establish and the connection is added to a session graylist. In particular, the present invention relates to a method that utilizes reporter oligonucleotides as biochemical barcodes for detecting multiple protein structures or other target analytes in one solution. The DNS server may then be queried to determine that the mobile node with that nickname is on-line and/or to determine how to reach the mobile node with that nickname.

1459828276-212e1d10-0ddd-4450-be67-784c87e83a29

In order to even out the electrolytic treatment of workpieces 9 made of electrically non-conductive material and having a very thin base metallising 6, 8, a device is employed in a manner according to the invention comprising means for bringing treatment liquid into contact with the workpieces 9, means 10 for electrical contracting of the workpieces 9 at contacting sites and counterelectrodes 5. The insulating layer includes at least a polymeric resin; at least a fluorinated organic filler; and at least a non-ionic fluorinated surfactant. The positions of input/output coupling electrodes on the mounting surface with respect to the circuit board are aligned with the positions of the input/output coupling electrodes on the circuit board. The controller inhibits the discharge operation of the remaining recording sheets even if the recording sheets have not been stacked in the another stacking unit when the adjacent stacking unit is nonusable by the other recording sheets. In another embodiment of the invention, each enterprise object has a primary key that is used to maintain the identification between an enterprise object instance and a corresponding database row. The peripheral wall has a length slightly less than the width of the structural wall thereby positioning the installed electrical devices flush or slightly less than flush with the outer surfaces of the structural wall.

1459828276-92ecfa6e-df52-42e4-a09f-00e17c2a5c41

A combustion chamber for a swirl flow two valve spark ignition direct injection engine includes a cylinder with a closed end having a wedge shaped combustion chamber recess. An air supply means, supplying air taken from outside into the wafer treating chamber, includes a chemical contaminant removal means for removing

chemical contaminants from the air. Additionally, an optical excitation source is provided.

1459828277-37127168-3ba9-48ad-b3b4-549ab03e3aa6

A method of making a bread product comprising formulating and mixing a bread dough having flour as a major ingredient, and having the following additional ingredients, where percentages are based on the flour weight:Ingredients %Salt\u20021. Optional guide vanes positioned on the plows can further control the grinding process. Slots extend longitudinally parallel and adjacent to the base top, the cutout sides, and the cutout bottom. A second probe is shielded from the falling precipitation. The panel housing is provided with an opening such that when the panel housing is unfolded, the adjacent sides of the fiat display elements closes contact each other. The connecting protrusion is adapted to be inserted into the connecting holes.

1459828277-86699c67-7a55-4c63-9a85-429e91fa1f61

A semiconductor arrangement includes a first and second controllable vertical n-channel semiconductor chip. If the resinous material is thermoplastic, the material may be heated to mechanically bond to contact surfaces. The cooling apparatus includes a pair of fastening blocks, one or two heat conducting blocks, and at least one heat pipe. The driven tab enables to push back the safety closure into an opening position allowing the gas to flow in the valve.

1459828277-ce27ffd9-fd1c-42b2-8452-e826e28a9ef1

A unitary elongated member comprises bends at predetermined locations to form an upper ring and a lower ring. An etch stop layer is formed over the metal feature and the dielectric layer using a precursor and a carbon-source gas including carbon as precursors. The container with the straw and the float is transported to an anchoring machine which engages the straw and the container to trap the straw and float entirely within the container.

1459828277-e86a66a7-75d2-470a-8b34-e1e2cc3cb811

A method, apparatus, and article of manufacture altering a displayed image presented to a user on a viewing device using a user-controlled orientation of the viewing device to determine how the displayed image is to be presented. Since the coupling ring is locked by the joint, the rotation shaft is prevented from being arbitrarily separated from the joint. The control section controls the selectors 24, selectors 25, buffers 26 and sign multipliers 27 in accordance with whether the input discrete-cosine block has been subjected to field division and where the discrete-cosine coefficients are located in the block.

1459828278-2145a784-0e83-45f1-a0b8-3b7d876888d8

The invention relates to a phase shift mask for lithographically producing small structures at the limit of a resolution that is predetermined by the wavelength of the exposure radiation. The coating comprises a resin and a polymeric colorant. In addition, the use of the thick portion prevents cracking from occurring between the translucent electrode and the circumferential surface of the pad electrode.

1459828278-af1b8108-b3f5-4963-9df8-00d6fe026306

The objective of the present invention is to provide a laminated phase retarder film that is superior in evenness, exhibits a biaxial optical property as a whole, and makes it possible to set the biaxial optical property over a wide range. The method includes the step of sealing and severing a pair of web portions along lines defined by coextensive first side edges and coextensive second side edges of decorative portions. As each high-level document command is implemented, an entry representing the high-level document command is set in a notification table stored in a persistent memory such as the database. A detent mechanism positioned within the camblock contacts a surface of a slide stop pin to hold the slide stop latch in place. The fine rotation butterfly circuit uses the control information to rotate

the intermediate complex number by a fine angle  $\theta$  to produce the complex output signal. Particularly, the invention discloses a modular system having the condenser and/or evaporator heat exchangers mounted outboard of the modules and being easily removable and separable by virtue of their positioning and valving.

1459828278-b96889b8-e024-4bda-a923-a618a587bc3d

The present invention is drawn to disinfectant compositions, which are human safe, e. The invention thus relates to the plants, seeds and tissue cultures of the variety CH952875, and to methods for producing a corn plant produced by crossing a corn plant of variety CH952875 with itself or with another corn plant, such as a plant of another variety. In the presence of a healthy macula, the blue light is filtered out and the fixation reflex is absent. A mail slot is provided in the security door which allows for a mail carrier to deposit mail within the central cavity of the mailbox. A one- or two-component epoxy adhesive, structural foam, or matrix material for composites, comprising the aforesaid resin components, , substantially complementary to a specific location of the chromosome.

1459828279-46093b19-ccb6-4e0d-941e-79b06303deb9

The present invention provides to patches having excellent skin-permeability and therapeutic effect by the drug with lower irritation. A mobile, manually portable device is utilized, which has an interface for a wireless Internet access. The menu file is downloaded first, and then data files for the overlays are downloaded in sequence.

1459828279-85828c6b-fe6f-444c-91ba-e1e7257b3ce0

A content user terminal including a utilization unit that provides a content utilization, and an interface unit 137 that inquires the content utilization availability to the portable content usage rule management device via a wireless communication and obtains a content utilization permission data which is a inquiry result via a wireless communication. The contact lists may be conventional contacts stored in a list of contacts on a scheduling and information management or other software packages in one embodiment. The method gathers the duty cycle ratio related to the fan from the PWM signal and an actual rotation speed of the fan from the TACH signal, and displays the duty cycle ratio and the actual rotation speed together on the test board. The electrolyzed alkaline water produced by this method is effective in cleaning and disinfecting both soft and hard surfaces. Increased viewership of advertisements can result in increased revenue generated from advertisements that may be realized by television programs, television producers, networks, and advertisers. The iCaf<sup>®</sup> may provide a search and/or document notification service and perform searches, download documents, and check for changes to specified documents even when the user is not logged on or using a computer at the iCaf<sup>®</sup>.

1459828279-c02706d2-2b5b-4fed-90a5-6d97a6c6d084

The invention describes a process for the determination of the concentration distribution and size distribution of lipoprotein classes in body fluids, e. A mandrel extends axially through the cylinder, and has a threaded portion engaged with the cylinder, such that rotation of the mandrel causes compression of the cylinder. The noise insulation sheet 20 is provided between the door inner panel 11 and the door trim 12, where it is hung down from the upper side to the lower side of the door inner panel like a curtain. In order to solve this problem, a mast is extended vertically from a lower frame and a platform that elevates and lowers along the mast wherein a ladder is extended vertically at a position opposite to the mast across the platform in a direction in which the lower frame runs, and a top of the mast and a top of the ladder is connected together via an upper frame.

1459828280-6a096956-eb4d-4e6f-9281-0bac6fee79a3

There is described a signal processing apparatus, which conducts processing of a signal outputted from an image capturing element that converts an optical image

obtained by irradiating light on an object such as document to an electric signal. Points of changing the signals with respect to a time base are set with time delays that lag behind one another during one period of a reference internal clock signal to reduce the number of simultaneous changes of output signals. The disks are mounted in spaced-apart relation on the center conductor pin and have different radiuses which decrease with increasing distance from the base of the center conductor pin. Each roller in the assembly can individually rotate around its center axis as the assembly itself rotates over a specific RPM range causing the longitudinal side of each roller to continuously strike the tires' treaded lower half at a predetermined position.

1459828280-708ac352-ff8e-46b1-91aa-bc4cd1b6b7d8

The invention discloses novel sulfur-containing naphthalimide derivatives, and the preparation and uses thereof. Each of the first light distributing elements includes a first refractive index pattern and a second refractive index pattern surrounding the first refractive index pattern. A first measurement scale is provided in which a plurality of uniquely color-coded base units of measurement are periodically disposed on the base medium. The data is divided into a plurality of segments.

1459828280-96d5776f-40e0-4c66-b845-d69ffc25b954

Methods and apparatus related to providing one or more completion step suggestions for a task that is associated with a user. Further, the apparatus is able to receive two interleaved streams of low-latency streaming interactive video. Second capability data is transmitted to the first device from the second device. The plug securing device is removed and the plug disconnected from the outlet when the user pressed the plug securing device into the replacement electrical cover and presses in on the sides of the plug securing device. chain, strap or cord, which extends along an axis of force application in the exercise machine.

1459828281-0f92dacd-d8fc-466e-b8c4-ffe32061c681

An insecticidal composition having as an adjuvant a phosphonate or an alkoxyated derivative or dimer thereof. A virtual view position movement module moves a first virtual view position for a first player and a second virtual view position for a second player at the predetermined speed, but stops the movement of the first virtual view position upon detecting first stop information and stops the movement of the second virtual view position upon detecting second stop information. The rolling ball is made of transparent material and the distance thereof with the light receiver is adjustable to vary image resolution.

1459828281-4dbe27a4-2575-4840-b806-16de70440216

A user interface is provided wherein a set of items is displayed as a set of item representations, and wherein a filtered subset of those items are visually identified in accordance with a user-defined criterion. When the application makes a request of a particular service, a service verification module compares the requested service to the list of available services and if the requested service is found in the list of available services, sends a signal to the application, the signal allowing access to the requested service for the application. Upon receipt, a second key material is generated at the second modem and is sent to the first modem. The first trigger circuit is serially connected to the first transistor between a first level and a second level and is connected with the first transistor in a first node. The adhesive sheet includes a base material and, formed thereon, an adhesive layer having an adhesive composition including an acrylic copolymer containing 20 to 95% by weight of a structural unit derived from a benzyl acrylate, an epoxy thermosetting resin, and a thermosetting agent.

1459828281-6fc19b5e-7035-4cc1-b519-1d7155e6707d

A computer display includes a screen, a workstation port configured to receive a workstation signal from a workstation controller, and a wireless port configured to

receive an external signal from an external device. Each of the first and second guide plates has a plurality of protrusions extending from an outer side thereof and recesses defined in an inner side thereof. The wick is disposed on an inner wall of the evaporating section.

1459828281-828224cf-6048-4f23-bd57-82c76f8e2519

A dispersion correction circuit is provided for use with an input driving signal. The plasma display panel includes a plurality of discharge cells defined by a corresponding plurality of barrier ribs, and a phosphor layer formed on the bottom surface of the discharge cells and side surfaces of the barrier ribs. The stringer is spaced both from the nose of the surfboard and from the tail of the surfboard so that the nose and tail are more flexible than the length containing the stringer. When the first member and the second member are separated, the first member forms a small tape dispenser to mount a small tape roll on the first tape roll mount and cut a tape of the small tape roll by the cutter.

1459828282-166c9f29-cbe8-4f26-9064-82e51325cffc

The invention provides a semiconductor device and a method for manufacturing the same that are capable of contributing to a further chip downsizing in the cross-point FeRAM. An image of the spatial light modulator can be formed upon the imaging device and a controller can be used to position optical elements in a manner that effects translation, rotation, and scaling of the image so as to provide desired alignment. The example can determine a distance from the location of the mobile device to a location of a wireless device. A nonmagnetic layer is provided on the third ferromagnetic layer, and a gate insulating film and gate electrode are provided in that order on the side face of the nonmagnetic semiconductor layer. The device location determination also includes determining a location of the device from the signal strength values and performing a remote function with respect to the vehicle.

1459828282-8e3bf1fb-4a94-4cf4-b5e7-ac2872d01ecd

An aqueous, alkaline cleaning composition for use on hard-to-clean soils, encountered in pharmaceutical, personal care, food and cosmetic manufacturing, comprising a source of alkalinity, a biodegradable surfactant system further comprising one or more surfactants, one or more hydrotropes, and a UV-analyzable surfactant, and a biodegradable chelating agent. Video compression via a video compression unit and video transmission via a video transmission unit are performed in parallel. A first mechanism selectively adjusts the vertical position of the horizontal member, while a second mechanism selectively adjusts the horizontal position of the vertical members to define a first projectile target area. Magnetic fields surround the force-sensitive regions and are altered by force vectors passing through the force sensitive region. In a preferred aspect, R comprises 15-16 atomic % B; of which Ce is approximately 0. The pools of virtual processors have assigned physical processors.

1459828282-98d5a35d-be7f-40ab-aafb-74ad943087e4

Liquid cooling systems and apparatus and data processing systems and communication systems with liquid cooling systems are presented. A filter is disposed on a light emitting forward path with a space to the semiconductor light emitter to reflect back at least a portion of the first light. In order to prevent an unauthorized, unintended, or undesired transmission of at least part of the body image data, one or more settings or policies can be specified that can control which portions are transmitted, received, and/or displayed. In one embodiment, a prepreg is further disposed within the molding chamber, wherein the prepreg is disposed on the first surface of the elastic layer. And, a notification for corrective action is issued if the temperature is out of a predetermined alarm range.

1459828283-80ebf413-1ca7-4584-b730-9b2a977e8ebc

A bearing member placed at an end of a photosensitive drum, and a shaft member is

attached thereto. Each coil has a first end disposed inside its respective coil and a second end disposed at an outer perimeter of its respective coil. The RFID tag includes memory which stores a value representing cumulative duration of use of the light bulb. If an HARQ message for the initial slot data is received from the receiver, indicating that at least one of the sub-block in the initial slot data has a reception error and the other sub-blocks are good in reception, slot data with a sub-block having an error repeated within the number of the sub-blocks is retransmitted after transmission of initial slot data. Compositions containing the above ingredients and at least one free radical initiator, curable compositions containing the combination and processes for making and using the compositions are also disclosed. If desired, monitoring and estimating of network congestion can be initiated only after identifying the existence of network congestion, for example, represented by a lack of flow control tokens at a sender node for a destination node.

1459828283-e2cd28c8-c687-4a26-b59b-27ba5fa81259

Prior art methods of receiving, organizing, and implementing the data transmitted to mobile devices, such as ESG fragments, have a great impact on mobile device performance and battery lifetime. Also described is an embodiment of the invention directed to a laboratory automation system, a method of laboratory automation, a computer implemented software program product, a method of doing business, and a laboratory automation network. The monitoring circuitry having: manipulation circuitry to transform monitored data and combine it with previously manipulated values; and registers to store previously manipulated values; and counters to count events; and condition detection circuitry for detecting when a signal is at a specific value or range of values. An electrode is joined to the soldering portion by solder. The received audio data is provided to audio equipment for output. Analogous to a web browser, the AGC provides facility for retrieving the associated XML application from its website and processing the call accordingly.

1459828284-179a57fd-970d-40dc-854c-d0a18876fdc9

A method of manufacturing a CMOS image sensor. The exit tray is insertable in and removable from the body of the image forming apparatus. A space between the external wall of the preform and the internal wall of the mold is tailored to the thickness of the external layer of the hollow body to be obtained, so as to allow migration of the thermoplastic of the interlayer, and possible of the liner, beyond the interlayer. In one aspect, the audio signal and video image specification are transmitted to an audiovideo signal transmission system.

1459828284-1afc2ea6-d5bd-468b-9108-752bff88ffca

A computer executable process for simultaneous visual depiction of plural text hierarchies of a visually displayable machine readable text, including provisions for a visual cue as to a location of a user select text within the simultaneous visual depiction of plural text hierarchies is provided. The p-type silicon layer interposed between the n-type silicon is then subject to an anodization process to form porous silicon. The output is buffered by another inventor.

1459828284-509d63cc-97c5-43d9-b46a-008fa05755fb

Content monitoring and control technology, in which content download activity, content playing activity, and/or remote control activity of a media system is monitored. The transverse flow motor has a stator and a rotor, whereby the stator includes U-shaped stator blades which form a cylindrical ring, and whereby the rotor has permanent magnets which are arranged at the pole ends of the stator blades and which form cylindrical or annular rotor elements. The apparatus also includes a signal processor that provides an angle measurement \u003b1m.

1459828284-7be49de0-5ccc-47c1-9bdb-1af98fade31c

Method and systems are disclosed for enabling a computer system to generate a request that includes an instruction identifying the authentication method or

methods to be used when authenticating a subset of the client computer systems or users network connected to a server computer system. Next, the network checks the authenticity of the user using a ciphering key, corresponding to the temporary user mobile identifier and a random number. The support member includes: a contact part which contacts the blade; and a pair of attachment parts which are attached to the housing. The wrapper, in turn, directly calls the associated platform dependent method. The method allows simulation of the thermal and electrical behavior of a battery. After channel estimation has been performed, the phases of the received data symbols are analyzed in order to determine the frequency shift.

1459828284-f2ca27f3-8c13-4728-bc77-c1b6c419f0f5

A method for producing a semiconductor device having a sidewall insulation includes providing a semiconductor body having a first side and a second side lying opposite the first side. The handle unit includes a handle-side connector having a handle-side connector terminal section, rear handle fixing members for mounting the handle unit to the main unit, a connector fixing plate for mounting the handle-side connector to the handle unit, and resilient members interposed between the handle-side connector and the connector fixing plate. A circular arc wall surrounds around web of the crankshaft with a slight distance from the web. Wireless communication is with a transceiver mounted in or on a lapel unit, a walkie-talkie, or at a remote location. The example method includes receiving a moment and force input from a test object surface and reconstructing the surface topology based on the neural network outputs.

1459828285-72d446a3-fb6e-4de1-8996-0a7c0ff956c1

A semiconductor device includes a substrate of a first type of conductivity provided with at least one gate on one of its faces, and at least two doped regions of a second type of conductivity for forming a drain region and a source region. The semiconductor laminated body includes a plurality of trenches arranged in a periodical manner to penetrate through the second semiconductor layer and the semiconductor light emitting layer and reach the first semiconductor layer. Furthermore, the dental materials have increased resistance to microleakage and have increased bond strengths. The binarized data is split according to types of objects, and characters and line drawings are vectorized and stored in a storage unit. Due to the reduced dimensions of the thin-walled first nozzle portion, a much smaller weld pad and pad-to-nozzle weld can be used. Compliant LGA bumps are applied to the uncured conductive adhesive material which material is then cured.

1459828285-d5907d8b-cd76-41d6-ad47-811ca370f2fd

An image forming apparatus and a method of editing a routing table are provided. The QSTA generates a random number between 0 and 1. There is also provided a liquid-crystal display device having an illuminator defined above, and a liquid-crystal cell disposed on a light exit side of the illuminator through the polarizing member of the illuminator. 6; and wherein a ratio  $KL$  of a face thickness  $K$  to a flank thickness  $L$  in the tool is 1. flip-flops connected in series in each data path. The fuel tank is connected to a fuel cell and includes a tank body having a fuel opening and a pin hole for maintaining an inside pressure, a floater positioned on a surface of the fuel stored in the tank body, and an air pipe connected to the pin hole and an upper part of the floater.

1459828286-11d53ef3-31f7-4bd8-acd9-2bfd5c680fb5

A display and scanning assembly wherein light reflected from an image being scanned is transmitted to an optical sensor through an optical shutter assembly via a light guide assembly is disclosed. The sealing lip of the sealing device is applied to the front side of the roller by means of a sealing contact. The width of the first core layer is defined based on the width of an unoxidized semiconductor material sandwiched between oxide films the parts of which are thermally oxidized. The image detected by the detector represents a difference in amplitude and phase distributions of the reticles allowing foreign particles, defects, or the like, to

be easily distinguished.

1459828286-4f99408e-b497-4865-8fde-693b491005e6

An electrically insulative conformal coating is applied at least to the active side and one or more sidewalls of the die during wafer processing. The mobile transmitter periodically transmits a mobile open signal as it moves away from the reception range of the base operator until that signal is lost. The first and second control gates adjacent to each other with the impurity layer interposed are connected to a common contact section. Within the media center extension device, the second media stream is decoded into a second media signal, which is rendered for display on a display device.

1459828286-65a79ac4-bed1-42cb-bf01-7fbc7ca765a3

The present invention provides a security module having a communication interface being capable of operating according to any from a selection from a plurality of predetermined operation modes or communication protocols. The scene is modeled as if viewed from above, including a representation of a viewer's eyes, a representation of a viewing screen, and an indication simulating what each of the viewer eyes perceives on the viewing screen. The valve assembly defining a fluid flow path passing, in a first fluid flow mode, between the valve member and the valve seat, and into the fluid passage.

1459828286-84eee18d-f791-4b6c-9f60-4cfbd1021a60

The invention relates to a robot, specifically a painting robot, having at least one moveable member which has a conduit for lines which houses at least one line. An error management part manages the number of times errors occur in respective disk drives. Acoustic energy may be introduced to a focal zone and narrow band interrogating signals may be used. In other embodiments, the wound treatment appliance also includes a vacuum system to supply reduced pressure to the portion of the body to be treated in the volume under the enclosure. The priming valve has an inlet and an outlet. Machine data is a product of information-processing systems and represents the evidence of particular events that have taken place and been recorded in raw data format.

1459828287-1e61d3ab-348e-4e3c-8075-e81fee01350d

Metal-insulator-metal capacitors and methods for fabricating MIM capacitors. Curvature at each of a plurality of points on the stroke is estimated. A corresponding device that serves to control the motor is provided, in order to process these rotor position signals into a signal that indicates the absolute rotational position of the rotor. A first filter is provided in a signal path between the second port of the first signal combiner distributor and the sixth port of the second signal combiner distributor.

1459828287-7d04c6f3-d0cd-4ea0-bccd-d9c6e945baf6

A method of storing gamma data in a display device is disclosed. The voice coil motor is received in the housing. The belt retractor is further provided with a switch device with which the energy absorption is adjusted. The toy also includes a digger assembly mounted to the rear portion of the frame and having a bucket with wheels that is removable, the bucket being operative as a wagon when removed. In use for cooling liquids, the heat exchangers are arranged within a frame and brought into contact with the liquid to be cooled. An inner end of the lens is rested on the recess.

1459828287-fddc52af-adec-4c28-a47c-bf1d1c036208

It is an object of the present invention to provide a thermal transfer sheet which has a conductive primer layer having adequate adhesion and heat resistance without using a binder resin, has an excellent antistatic property, and hardly causes troubles in printing. A cartridge, being the largest in size among a plurality of process cartridges, is detachably arranged at a location at which it is first

exposed to outside when a cartridge tray is drawn out. The system also includes a wave reflection device configured to sequentially reflect each of the plurality of radar transmission signals onto separate respective spot-portions of the antenna reflector.

1459828288-28aa193f-7ea8-422c-859a-9bf4d18182e9

A medical device comprising a medical procedure patient platform having a peripheral edge, a length of the peripheral edge having a substantially rigid male connecting member; and, an extension having a substantially and permanently rigid female connecting member, the female connecting member configured for rotational mating attachment with male connecting member. A tab extends outwardly from and generally parallel to a plane defined by the second side of the habitat piece. An overhung metering blade mounted at the housing opening meters a layer of uncharged toner onto the dispensing roll. The fixing device is used for fixing the inner plug onto the outer plug. A multiflow guarantee processing unit guarantees an execution result of the previous flow stored in an allocation register on a register update buffer until the following flow is committed. The resulting U+4 oxidizes and solubilizes rough uranium deposited on the surface of the cathode.

1459828288-64ffc50d-f8e3-43c1-96af-6596da668bbe

The yield of a sealing process for a semiconductor device which adopts a flip-chip mounting method is to be improved. The disclosed method is particularly suitable for the fabrication of microelectronic devices and components thereof including the fabrication of field emission display devices. The efficacy of the technique for high resolution separation of oligonucleotides is demonstrated for an industrial mixture.

1459828290-a4ffe361-2f94-40eb-b86e-44fd8b49e598

To monitor light pulses from a light source, such as a laser, sense signals are provided to a photosensing component or array, causing photosensing during a series of one or more sense periods for the light pulse. The first substrate has a common potential line and at least one testing line separated from the common potential line, and the second substrate is disposed above the first substrate. Each transverse border possesses a cutting edge situated at the intersection between said borders and the inside face, each transverse border co-operating with the inside face to form a cutting angle lying in the range 6° to 18°. The zwitterionic block copolymer is configured to undergo microphase separation to assemble into alternating lamellar domains; with one of the alternating domains being composed of the first terminal block, and with another of the alternating domains being composed of the second terminal block. An actuating mechanism operates a locking element of the opening in response to a sliding of the hooking head with respect to the elongated member.

1459828290-ba50add9-1678-441a-b7f4-8dd230b83e35

An exercise machine has a main frame and a user support frame pivotally mounted relative to the main frame for rotation about a user support pivot axis between start and end positions. According to this image processing method, it is possible to precisely and quickly determine an area of a particular image from a moving image. , with standard commercial fruit growing practices, such as pruning, thinning, spraying, irrigation and fertilization. These feature vectors are then accumulated and aggregated automatically in order to generate a data set that can be statistically analyzed, data mined and/or queried. One or more of the basis vectors are selected and set as the TOC print for the CD. Specifically, the present invention provides systems and methods that allow for physical verification of a payment card upon delivery of goods that are purchased in the context of a remote transaction between a buyer and a seller, including, for example, goods that are ordered via phone, mail order, fax or the Internet.

1459828290-cd547927-48f0-4f48-860b-52302c959b09

Multi-layer flexible transfer tapes are provided which are useful for covering printing or typing errors in texts or drawings so that corrections may be made. Integrated circuitry is positioned on the substrate and includes drive circuitry. In accordance with another aspect of the invention, a funnel is provided which includes multiple adjacent panels and a glue strip adjacent to one end, which enables the funnel to be manufactured with conventional process machines. An enhanced compiler is capable of analyzing the annotated source file and automatically generate the bytecode required to create, deploy, and manage the persistence of POJOs without requiring knowledge of specific details of the persistence to corresponding data entities in the underlining database. Fluctuations in transmitted light intensity are then correlated with detection of opaque inclusions in the sample.

1459828291-3eb68aa7-c8a9-41d9-8a19-7fd9c38df4ac

There is disclosed an interactive display system comprising an interactive surface for displaying an image and for receiving inputs from remote devices, the system being adapted to detect the presence of at least two remote devices proximate the interactive surface. An output image to be projected on the display surface is partitioned into a black image portion having a fixed relationship to the mobile coordinate frame, a stable image portion within the block image portion having a fixed relationship to the stable coordinate frame, and a mobile image portion within the stable image portion having a fixed relationship to the mobile coordinate frame. The headstrap is fastened to the breathing mask at the top, and the neckstrap is fastened to the breathing mask at the sides in the orientation of the breathing mask when it is being worn. In addition to this, details of a job which is being processed, details of a selected job, and a state of each printer are also displayed. When a set of blades is installed on a blade rack of a ceiling fan, only the blade is set around several pillars on the blade rack, the clamp plate of locking plate is set to locate on the pillar, and a pillar passes through the thru hole. If yes, the communication controller makes a call to the receiving IP phone to establish communication between the calling and receiving IP phones.

1459828291-7b287dc9-d530-4b64-963a-edb955bd2e62

Meta-xylene is recovered from admixture with other C8 aromatic hydrocarbons including ortho-xylene by liquid phase adsorptive separation. The safety restraint system has a seat belt webbing for restraining an occupant of the vehicle, a seat belt retractor, a deflector, a height adjuster, a latch plate deflector, a buckle and a communication link. The method begins with instantiating an indicia control in the design application that will utilize the object control for indicia printing. A biasing element is provided to normally bias the headrest to a home position. The processing resource has an output to provide the new video signal threshold to the comparator circuit corresponding to the selected signal channel.

1459828292-1d20ab6a-1466-43cb-9c4d-117a4d52686d

A method of configuring a storage device is disclosed. A user request for media content, is processed intelligently, either by directing the processing of the request to one of a set of transcoding servers so as to effectively balance the load among the servers, or by directing the processing of the request to an appropriate alternative means for satisfying the request. An information detecting section detects this reporting information and a judging section judges, by using the reporting information detected at the information detecting section, whether or not the photographing is permitted, whether or not an image is stored, and whether or not the image is altered. Alignment is achieved by applying, at a particular angle to the drift field, a much stronger alternating electric field that \u201clocks\u201d the ion dipoles with moments exceeding a certain value.

1459828292-3248b252-0cdb-4d98-8fa6-c3aae257b4db

A fine feldspathic earthenware including a body and a glaze layer covering surfaces of the body. A spring-loaded device adjacent to the feed means dampens the jerk

which occurs when the slack loop of wire runs out and wire begins to be drawn from the magazine. Each of the plurality of memory cell blocks includes memory cells connected to a plurality of word lines. A key generation unit generates the first key with use of the second key and the obtained key generation information. In the engaged position, the adjustment member traverses the guide surface. The hydraulic jack is mounted over the new water tube panel to provide the power required for aligning the two boiler water tube panels for welding them together.

1459828292-73931144-153a-4032-bbe0-8f64344138d2

A multi-output switching power supply circuit easily produces multiple outputs with increased power source conversion efficiency. Also included is a network component comprising at least one processor configured to implement a method comprising decorrelating sparse data or data including sparse data, compressing the sparse data using compressive sampling, and encoding the data. The circuit and method may be used to quench an arc that may form between high voltage electrodes associated with an ion source to shorten the duration of the arc and mitigate non-uniform ion implantations. Each of the scan signal line driving circuits further includes a signal wiring for connecting the scan signal line driving circuits to one another and applying the driving signal. The production method is the method for producing an aqueous dispersion of fluorine-containing seed polymer particles and assures a low foamability and gives an excellent gloss of an obtained coating film and excellent adhesion to a substrate when the fluorine-containing seed polymer particles are used as a coating film forming component of a coating composition.

1459828293-126e3d42-3026-46e0-a269-d33c793d47e7

A dual-port static random access memory includes a multitude of programmable delay elements disposed along the paths of a number signals used to carry out read, write or read-then-write operations. Light traveling from the light source in a direction perpendicular to the flat surface enters the light guide plate in an expanded manner due to refraction at the protruding surface. Additionally, the invention involves using optical equipment in conjunction with the analytical equipment to analyze samples and control the operation thereof. The individual pieces are eliminated, thereby electrically isolating the cable exits. In general, the methods rely on using the well bias to change transistor threshold voltages.

1459828293-294c4600-6eaa-48b1-af50-71a8f1f11ee4

An electromechanical brake has an electrical actuator which generates an actuation force and acts on at least one friction member in order to press said member to elicit a friction force against a rotational component, which is to be braked, of the brake. A sequential access memory cell may include an inverter-like circuit, an inverter, a preset transistor, an access transistor, and a read circuit. Namely, the light box housing supports at least two light sources, the display signages and the light-directing panel.

1459828293-3434a232-1508-427f-b6ed-e08c23864f5b

Extra coagulant is added to the cuff portion of the former by a spray nozzle located between the coagulant and latex dipping tanks. Such an article includes a first polymer layer containing a polarizing agent, a second polymer layer containing melanin and wherein the second polymer layer is disposed upon the first polymer layer. A generally tubular exhaust inlet is disposed in generally tangential relation with the cylindrical inner housing surface for receiving a mixture of exhaust gas and entrained cooling water.

1459828293-93225494-6ce6-4ee5-a46d-274cd92c6a4e

A floating gate is formed on a semiconductor substrate via a gate insulating film. The fabric also includes first and second companion cross machine direction yarns positioned between each pair of adjacent primary cross machine direction yarns. Also, proactive forward error correction packets may be added to a window of the data block.

1459828294-533d2253-d18f-43db-8d34-afa6e8d5e0ab

A fastening device for a gun barrel with respect to the turret of a carrier vehicle of the type incorporating a cheek integral with an oscillating mass carrying the gun barrel and an articulated part fastened to said turret, wherein said articulated part is fastened to said turret by a pivoting link and in that said part incorporates means to join it to said cheek. The cement compositions can be applied as a plugging cement composition, segment cement, or even as after applied artificial skins or coatings. The product may preferably be pharmaceutical products, nutraceutical products, or devices such as absorbable sutures or medical stents, although any moisture-sensitive product is contemplated by the present invention. At least some of the restrictions may provide a warning to a user of the second application. The main filter circuit filters signals in frequencies different from the predetermined frequency. Reinforcing core portions are formed by filling the epoxy resin adhesive into a central hole of each of the tracking coils, and a reinforcing connecting portion is formed by filling the epoxy resin adhesive into a gap defined by the lens holder, each of the tracking coils, and a focusing coil.

1459828294-f95ec08d-f2c0-45c3-9dbc-6b4de9af936d

Compounds useful as surface coating agents, including compounds of the formula: . Primary leaf springs are each coupled at their respective centers to respective drive shafts by pivotal arrangements. The cams have a flat portion and a extending handle portion, the flat portion becomes adjacent a sealing channel when in a sealing position. A conduit receiving slot formed in the bottom wall of each module to engage a top portion of a conduit from an adjacent lower module when the modules are stacked end-to-end to provide a continuous fluid passageway through the planting column.

1459828295-7502845c-8ff6-4b76-a522-e915fbc4c27

The preferred embodiments described herein provide a method and system for facilitating selection of stored medical images. A vocoder communicatively coupled with the transceiver receives the verbal content packets, and a situational awareness encoder/decoder communicatively coupled with the transceiver receives the non-verbal content packets. Once the temporally-correlated event metadata has been stored for a conference, the conference may be indexed based on the metadata. Different zones of the extracted articles are displayed. This provides an automatic secure electronic document registration system on the cloud communications network and the social media network.

1459828295-99d828c7-7c11-455d-9633-efa2186441bb

A method and an antenna array system are provided for estimating parameters of radio signals impinging on antenna arrays, for estimating angular parameters, for estimating angular distribution types, and for selecting types of antenna array processing. Useful amounts of light may be utilized at the face of the window or at the face of the transparent substrate. A graphical user interface enables selection of a skin-related application from a plurality of skin-related applications. The pressure sensing mechanism has a pressure sensing chamber and a diaphragm. In some embodiments, the turbine shroud and/or the ejector shroud include internal rib members whose shape or length can be changed to alter the characteristics of the wind turbine. The thienopyrimidinone derivatives show pharmacological activity against metabotropic glutamate receptor-related diseases, including pain, such as neuropathic pain and migraine, psychiatric diseases, such as anxiety disorder and schizophrenia, urinary incontinence, and neurodegenerative diseases, such as Parkinson's disease and Alzheimer's disease.

1459828295-a8e4d11d-55b9-4175-a477-c11169272049

A recipe wand reads meal plans and recipes for a recipe book, and with data about the appliance and one or more cycles of operation, sends data about a consumable to

the appliance to automatically create and selectively commence a cycle of operation on the consumable according to the recipe book. The semiconductor die is disposed over a conductive substrate. The valve body comprises a valve bore in which the elongate valve stem is configured to translate, and a flow path intersecting the valve bore and into which the valve stem penetrates. The computer-implemented method may additionally include identifying a data-loss-prevention policy that applies to the file.

1459828295-fb403bf5-71e0-4b43-afb5-3e185d984258

A method for fabricating a semiconductor device. A pre-boot driver is accessed at a computer system during operating system runtime of the computer system. The air entrainment is controlled so that the properties of the air flow are not diluted by the air entrainment to a point where the drying performance is degraded. A first gate is formed on the insulating layer at least partially between the first and second sourcedrain regions and above at least a portion of the channel region, and at least a second gate formed on the insulating layer above at least a portion of the channel region and between the first gate and the second sourcedrain region. The message also includes a time tag representing the particular time.

1459828296-00ccf990-6375-43cd-ada8-1dc0e9ce47c5

An optical potentiometer comprised of a specialized circuit board and a movable reflector device capable of traveling left and right stably on the specialized circuit board. The fixtures include electronic modules and energy storage devices. The drive shaft includes a cylinder flange joined to one end of a drive shaft cylinder, the cylinder flange having a concentric shaft extending outwardly therefrom and a plurality of members extending longitudinally outwardly from the concentric shaft, wherein the members are adapted to fit within the twisted triangular coupling hole.

1459828296-19db8a73-74c9-4428-89cd-1b00f6e3edb9

An electronic apparatus includes a circuit portion having a connector to which an interface cable is connected, a case for accommodating the circuit portion and having a wiring route for the interface cable leading from the connector to an external space and a connection opening for exposing the wiring route, and a cover for opening or closing the connection opening. The test cell includes a test cavity, and the seal structure is in communication with the test cavity, wherein the seal structure is configured to be breached to change an initial cavity pressure within the test cavity to ambient pressure. An alternate technique estimates high-accurate motion vectors using different interpolation filters at different stages in order to reduce computational complexity. The present disclosure provides the speech receiver with a speech recognition function, when the speech information of the instant messaging is received by the terminal, it can help the receiver to normally acquire the content to be expressed by the speech sender under an inconvenient situation. A cutting member resides within the screw adapter, typically disposed between two clearing ports. All incremental adjustments in phase shift are counted to provide an indication of delay of the circuit.

1459828296-536d2139-b0e7-48a7-b359-7da9d2414534

Methods, systems, and devices are provided for selecting a wireless access point from a plurality of access points operated by a plurality of wireless service providers, where each access point may be enabled to concurrently compete for a user's access. Then classes of words or word groups belonging together of the reading results temporarily stored and rejected, consisting in each case of  $n$  address words,  $n=1, 2, \dots$ . All fibers can be aligned in a single direction slanted to the longitudinal direction of the bar.

1459828296-b9e72852-2b8a-439c-b82b-35425edf6df3

An optical structure includes a substrate for receiving an optical device. The card reader has a card insertion opening and a card holder section. Each certificate is

associated with an identity which is excluded from the communication of the hash of the certificate. The first adhesive is located at the top portion of the front panel such that the opening is in contact with the first adhesive when the flap is closed. The disclosure also relates to therapeutic methods comprising the step of administering to a patient in need thereof a therapeutically effective amount of a therapeutic composition containing the crystalline form of the disclosure or crystalline genistein sodium salt dihydrate.

1459828296-c322cabd-886d-448d-aa99-068ac9d7424d

The present invention provides a semiconductor substrate comprising a semiconductor layer 3 formed on a supporting substrate 1 with interposition of an insulating layer 2 therebetween, wherein a mark is formed in a region other than a surface region of the semiconductor layer; and a process for producing the semiconductor substrate. The tube has an evaporation region for receiving heat to evaporate the working fluid into a vaporized working fluid within the chamber disposed between a first condensation region and a second condensation region opposite the first condensation region for condensing the vaporized working fluid back into a liquefied working fluid within the chamber. Other embodiments include the coating of implantable stents for prevention of restenosis. The locking mechanisms are pivotally moveable between a first position, in which a stop member prevents further pivotal movement in one direction such that the engagement rods are positioned to allow the arcuate support bar to slide freely over the engagement rods, and a second position, when weight is applied to the locking mechanisms. A glass member is supported on the stepped portion of each of the strap portions for closing the first open end of the hole. Determining whether or not the communication terminal is out of range is based on a transmission level of a transmission signal from the communication terminal to a base station.

1459828297-1c3aa28f-fc77-4c0a-8c23-215857a85f53

A method of reducing readwrite head wear and disc wear through controlling fly height of the readwrite head to improve reliability of a disc drive is disclosed. In some embodiments there is a set of string matching slice circuits, each slice circuit of the set being configured to perform string matching steps in parallel with other slice circuits. The supercritical fluid may be a fluid in which Si is not oxidized and may be, for example, a CO<sub>2</sub> supercritical fluid with a pressure of about 60 to about 200 atm. The voltage converter increases or decreases the voltage of the electric power supplied from the fuel cell. Either embodiment takes into account the different problems that are introduced when the plurality of storage devices are located in different time zones.

1459828297-21cf00de-91c8-4971-a008-d5f1e92d82e2

New Gp32F protein for determining, localizing or quantitating single-stranded DNA or RNA molecules comprises a Gp32 protein conjugated at an environment-sensitive amino acid to a fluorescent label. Elements in the network are provided with configuration information respecting OAM messages together with connection signaling upon setting up a call through the network. Funds are collected for each of a plurality of partial payments prior to satisfaction of the set of conditions, with at least two of the partial payments being collected from different persons.

1459828297-614f3d98-246a-4bd9-88a9-2ff5c9d733ac

An ink printing device is disclosed that incorporates a curing lamp located on the opposite side of a printed face of a printed substrate and partially cures a radiation curable ink by irradiating through the substrate. At least one of the modules has elongated openings formed therein which define deformable module side wall strips located between the module ends. A parameter for each of the outputs is identified to form a set of parameters. These arguments include the level of polymorphism but also the maximum size of the patterns to look for to address the general trade-off of generating few partitions with many blocks or many partitions with few blocks and which modeling constructs are used. Optionally, the layer of

echogenic material is disposed on at least a portion of the conductor or on one or more portions of the conductor. In this manner, the focused particle beam system mills the second structural element to produce a desired pole-tip configuration.

1459828298-0c4ad9db-ad24-4a1e-9190-ae9f5a08223a

A print cartridge is provided having an elongate body defining a number of printing fluid reservoirs along the elongate length with end reservoirs being larger than reservoirs interposed between the end reservoirs, a lid covering the body to seal the reservoirs, and a printhead on the body in fluid communication with the reservoirs. A base plate rotatably supports the hub on the upper surface. A data processing device is provided to process the amplified signals.

1459828298-30b19ff8-e5c8-47f0-b129-455c507816b4

A vibration damping device including: first and second mounting members; a main rubber elastic body elastically connecting the two members; and a bracket member fit into the first mounting member. Furthermore, when shifting from the powered-on state to the powered-off state, the communication apparatus sets the registered NFC transmission data in an NFC controller as data that is to be transmitted to an external apparatus such as a mobile terminal via NFC communication. Thereby, a coil antenna can be disposed so that, even when a coil antenna to carry out communications by inductive coupling is disposed overlapping with a memory array region, little interference occurs from a memory array wiring to communications by the coil antenna. Various designs and arrangements for use with a fluid tester, which may be part of a modular fluid tool, are disclosed in accordance with different embodiments. Specifically, antimicrobial catheters and other medical devices manifest antimicrobial properties as a result of the incorporation therein of antimicrobial microcapsules comprising an inorganic antimicrobial agent and a hydrophilic polymer.

1459828298-8431656c-e8fa-4ee4-b9ba-5c2d6cd6fdc8

Various embodiments of the present invention provide systems, methods, and processes for constructing a contact lens. A plurality of clutches and gears are operatively disposed on the input shaft, countershaft, and output shaft. Accordingly, the detected device is isolated from the network to prevent infection of the network by the detected device. The transmitted content is preferable secure so that only authorized users can access it. The slide bar clip has a pair of opposing jaws that extend from the central portion of the instrument attachment clip in a second direction that is opposite the first direction.

1459828298-d63d7ed8-0c14-473f-bc24-e90778e7b4c7

An apparatus for removing particulates from a wastewater stream includes a chamber having a wastewater inlet and wastewater outlet which promotes a generally horizontal wastewater flow. Mutually opposing first and second pole pieces are provided. Each control field is arranged between two user data fields and contains at least one transition. While embodiments may comprise an optical correlator, many embodiments perform one or more analyzes statistically. The condensation device includes a first fluid line configured to permit a flow of vaporized water to be discharged from the engine under its natural convection, a pressure-compensation device configured to permit a flow of air out of the condensation device; and a second fluid line configured to permit condensate from the flow of vaporized water in the first fluid line to flow to the engine. The method further determines whether the second resource with respect to other relevant resources has a first identifier associated herewith when one of the other resources is to be accessed by the system for display, and if it does, displays signaling information distinct from the display of the other resource itself signaling of the existence of the first resource.

1459828298-e364e739-071a-49f1-b548-8c8b16119420

An electromagnetic noise absorber to be attached around an electric cable to

attenuate noise transmitted through the electric cable. A vacuum return system connectable to the catheter outlet draws thermally expended coolant from the catheter and returns it to the low pressure inlet side. Said chamber can be configured to have a horizontal laminar flow of at least one gas stream in the radial direction and a vertical downward flow of another gas stream over wafers. Therefore, if the vehicle has collided, the power supply is shut off immediately, and if the vehicle has not really collided, the power supply is not shut off so as to surely enable the vehicle to run. The method 600 then determines 622 a real opacity of the currently scanned pixel according to a predetermined fill rule utilizing an intrinsic opacity of said polygon and the one or more winding count values.

1459828299-2b25b79d-d41e-445b-af52-c63d55514cf1

A new cultivar of *Agapanthus* named 'Full Moon', that is characterized by its mid season blooming habit, its full and rounded flower heads of open campanulate flowers, its flowers that are variegated with soft blue-grey margins and dark purple centers, and its tall plant height. Each device further comprises a localization unit providing a geographic position of the device. The local clock may control a rate at which the buffer outputs stored media information.

1459828299-387f233e-d227-4991-9dc1-73446b78d8f3

A transformer includes a first bobbin piece, a second bobbin piece, a first pin, a second pin and a magnetic core assembly. By presenting a well-log at about the same angle as the section of the well-bore under consideration, a person viewing the well-log will have the advantage of easily visualizing the inclination of the well-bore to aid in geo-steering, proper interpretation of well-bore measurements, etc. The gateway station scales the plurality of elements to form a reconfigurable plurality of beams. The active layer includes a plurality of heat radiation pins that extend in a direction of the thickness of the active layer. Playback of at least some harmonics of a low-frequency fundamental frequency can cause a listener to perceive the playback of the low-frequency fundamental frequency. Methods for preparing such compositions and cosmetic treatment methods employing such compositions are also provided.

1459828299-3bc46af4-709d-425f-aa47-dc5f6dda594f

A method for assessing repolarization abnormalities is disclosed. The method according to the present invention performs the restoration to original information based only on degraded information. The verification system comprises a voice response unit configured to query pertinent information from an individual and record the responses to the queries in a digital format. The Registrar web site communicates directly with the Customer and registers the Customer desired domain names and compensates the Reseller for guiding the Customer to the Registrar web site.

1459828299-48ff0b7d-a1c8-4653-8b37-27af147b9794

According to the present invention, provided is a cationically electrodepositable coating material comprising a resin for a cationically electrodepositable coating material, a hydrotalcite-like solid solution having a specific composition and, if necessary, a basic bismuth compound and/or an organic acid salt thereof. The mattress support is vertically displaceable by means of at least one drive unit for applying a vertical force to a corresponding solely vertically displaceable driven component and is stabilized during vertical displacement by at least one stabilizing means connected thereto. The second lens unit has a positive optical power. The sides of adjoining filter panels are inserted into opposed channels of the 'I' shaped connectors. The top portion of the second dielectric layer is removed so as to expose the dielectric capped bond pad and the dielectric capped interconnect.

1459828300-0a1e5879-e262-47ce-ac18-5ad2f10bc56c

A kit is described that modifies a standard screw jack for a trailer hitch, by introducing a safety lock mechanism. This makes the application orders of ink symmetric in each pixel of secondary color and thus there is no difference between application orders in formation of the pixel by either forward or backward scanning, whereby occurrence of uneven color due to the application orders of ink can be reduced even in execution of two-way color print. A process head holds a workpiece. The flexible member comprises an expandable polymer which is actuatable between a high volume state and a low volume state. Here, the entirety or a part of the preamble sequence of the femto base station which is used for the separation of the femto base station is reused as a scrambling sequence for said data.

1459828300-0c4b21e8-1962-4b2a-ade3-4e719b2db51e

A modular architecture for use in a network device such as a Remote Authentication Server includes a number of interconnected objects associated with processes, services, access protocols and other functionality provided on the device. The method includes: applying the braking device to a tractive element of the vehicle; using an electronic controller, causing the traction motor to apply a predetermined force to the tractive element; and using the controller, monitoring the tractive element for movement while the force is being applied. In some embodiments, a Venturi device based suction system is used as the first suction system to pick up the item, as this type of system is proficient at picking up items without requiring initial contact to create a seal. The line generator generates a line of illumination across the area. Various mechanisms within the fiber optic terminal block for adjusting the position of the ambient light wave guide are also described.

1459828300-36259eb6-d421-44c7-89da-7ad4e1c83ba5

A circuit and corresponding method are presented for generating an analog voltage from a digital input value is presented. Namely, by substantially increasing a value of an applicable voltage in excess of which a display defect starts to appear, a high numerical aperture and a high contrast ratio have been achieved at the same time. The restricting members are brought into contact with first portions of the fixing roller other than second portions of the fixing roller in which end edge portions of the pressing roller are brought into contact with the fixing roller.

1459828300-443fe393-5679-48e7-92e6-76d04a743ebe

A method for managing the allocation of resources to channel swarms in a peer-to-peer network. The beam can be folded into at least two segments. The first reflective surface is positioned proximate to a first end of the optical fiber. The arms are adapted to permit movement of the anchors along the arms and the connector is adapted to permit relative rotation of the arms in response to dimensional changes over time of the host structure. Based on the collected data, the system can dynamically adapt the user's goals and/or activities the user is performing or will perform.

1459828301-352cd580-ec9c-4292-bfde-fad2dc786d8f

A method of manufacturing a semiconductor device, includes forming a sacrifice film on an etching target film, forming an etching mask on the sacrifice film, etching the etching target film using the etching mask as a mask, removing the sacrifice film to allow the etching mask to adhere to the etching target film, and removing the etching mask. The rotor includes a metallic coupler and a polymeric frame molded over at least part of the metallic coupler. The zero crossing is, for example, a negative zero crossing. A code listing is generated associated with each of the threads for the data value variables, the data operators, the data processing order of execution, and the data result variables identified. The high-reflective mode frame is put on the second side, which is opposite the first side of the side plate. The contact points are made of formed wires extending into the base and having outer walls that form the contact points.

1459828301-f2e0e5e0-b9b4-4186-94cd-89c25e1c94b4

Particular embodiments of the present invention are related to a digital media benefit attachment mechanism for generating or attaching revenue rights and other benefits to one or more entities associated with socially distributed media. The assembly comprises a first mounting to mount to the neck of the stringed instrument, a second mounting to mount to the body of the stringed instrument, and an adjuster mechanism interconnecting the first and second mountings and adapted to adjust and fix, in use, the relative position of the first and second mountings. In at least one transfer region, the products are transferred to at least one removal arrangement such that each product at most partially overlaps the previously transferred product, the leading edges of the products being spaced apart from one another. The scoring methodology and the cut grading algorithm are designed to emulate actual observation grading such that the overall cut grade represents a fair indication of the cut quality of the diamond. This method simplifies the task of supporting multiple different operating environments.

1459828302-1daa5da8-894f-46f7-8b24-cea0d750fbe0

A self-cleaning valve assembly is provided, such as for use in a vacuum cleaner such as a particularly advantageous vacuum cleaner system that has at least two filters and self-cleans its filters via back-flushing, without needing to stop normal operation to self-clean. At least one electrical lamp is secured in each housing and an electrical wire having one end electrically connected to each lamp and another end which passes through an opening in the ring and enters through an opening in an adjacent ring wherein it is connected to the lamp in said adjacent ring. The cathode employs an end opening having an area at least as large as the internal cross sectional area of the rare earth insert to enhance throughput from the cathode end. In addition, the top layer and the bottom layer are made of polyethylene materials and comprise interface coatings respectively, so that the top layer and the bottom layer made of polyethylene could heat bonded to the polystyrene foam board without adhesives by the first and second interface coatings. The RAN may compare the metric to a threshold WCD prevalence, and based on the comparison, select a second extent of communication to engage in with WCDs of the first type or the second type. Other embodiments, including method embodiments, are disclosed.

1459828302-20f52f76-6739-4deb-9835-b71688995f14

A focused ion beam device is described. Irradiated polymers and fabricated articles, such as medical prostheses, comprising irradiated polymers also are provided. The second peak detector generates a second signal in response to receiving a threshold signal.

1459828302-a9f63f76-18d5-4ca7-936b-0e4030d32232

The invention relates to a method and device for the individual or group activation of tipping conveyor elements of a tipping shell sorter, which are provided with an electric motor tipping drive. Generally a stylus is presented upon a carriage associated with a column is utilized for displacement between positions on a component surface. The light transmitting original is read by moving the line light source and the contact image sensor unit relative to the light transmitting original. The foosball apparatus further includes an electronic digital display formed in each end wall for indicating a time period and a score.

1459828302-de0cab7-a618-45ed-8146-4bf7ecf91466

A dishwashing machine, in particular a household dishwashing machine, includes a box-shaped washing tank for receiving items to be washed, and a base carrier for support of the washing tank. The epitaxial side of the device may be directly bonded to an efficient heat transport system so that heat may more easily leave the quantum well stack layers and be disposed at a heatsink. In one embodiment, a sender of electronic messages, such as a news service provider, sends a session

initiation protocol \u201csubscribe\u201d message to a delay manager. A single spring pin lock connects a first shaft to the extension shaft.

1459828303-6a7fc4a0-c631-4fd2-a2c9-3a3c31017ad1

The present invention relates to target acquisition and related devices, and more particularly to telescopic gunsights and associated equipment used to achieve shooting accuracy at, for example, close ranges, medium ranges and extreme ranges at stationary and moving targets. The wireless communication system communication system includes base stations and mobile stations. The tabs in turn each include a ramp portion to facilitate movement of the cap bayonet tabs past bayonet tabs in a battery vent port as the vent cap is inserted into the port axially without substantial rotation.

1459828303-6f978bbb-d12c-4f27-a0ae-6aca1da68733

A baby harness is designed to concentrate the infant's weight on the waist and hips rather than on the neck and shoulder area, which is typical of conventional baby harnesses. For example, the functions of locating subexpressions in a range asserting expression and, determining whether the subexpressions satisfy the range of the range asserting expression are partitioned. The join message identification unit identifies a join message from among MAC frames from the user network. Another aspect of the present invention includes apparatus for measuring substantially correct data for applications such as generating data for monitoring, controlling, and optimizing processes and process tools. The present invention also relates to methods for treating a wide variety of conditions and disorders, particularly those associated with dysfunction of the central and autonomic nervous systems. The seal closes off a gap between the two elements to prevent impurities from entering the roller closing device when any radial deflection of the inner element takes place.

1459828303-e322a3cc-3bcf-4257-a57e-dd9f4cae732e

Selected novel urea compounds are effective for prophylaxis and treatment of diseases, such as cell proliferation or apoptosis mediated diseases. The system includes a sequencer clock for generating a sequencer clock signal having a frequency of 1N of the DAC sample clock. A photosensor monitors multiple parameters within the chamber and interacts with the microprocessor to control intensity, temperature and wavelengths. The resharpener knife units are introduced in the opposite axial direction into the knife receptacles of the knife ring from which the worn knife units had been removed. The premises server obtains the selection, accesses a device interface database and translates the selection into a device-specific protocol. This system avoids an unbalanced mass flow rate when the compressors are operated in series by unloading a downstream one of the compressors.

1459828303-e4bc2d68-7519-43f7-9cbf-a85852144170

Fracturing fluid comprising, in solution in water, a proppant and an associative amphoteric polymer, the said polymer having a molecular weight of at least 1 000 000 g/mol and comprising:0. These implementations are suited for operation within a parallel packet processor. The visual objects may be identified in a document by extracting metadata associated with the document.

1459828303-f186fb01-d31e-4f30-8021-5b4d175e7db7

This invention discloses and -24--25,26,27-trinorvitamin D3 analogs, and especially -25,26,27-trinor-24--vitamin D3, its biological activities, and pharmaceutical uses therefor. The system comprises three sections, that is to say cultivation, extraction and storage and reaction. The core of the duster has an elongated rod which is made from a resilient material and is covered by a close fitting cleaning or dusting sleeve made from napped material, cloth or other well known cleaning or dusting fabric or material.

1459828304-5e3fd511-a8b1-4ba7-8393-93ec3d865a7f

Various embodiments described herein provide systems, methods, software, and data structures that allow a page description language reader application, such as Adobe\xae Acrobat\xae, to provide a view of the assets compressed within a compressed archive. The alignment load-lock includes an alignment stage that aligns a wafer during pump-down. The back end of the horizontal channel is open, providing the user access to the aerosol nozzle in order to actuate the aerosol nozzle with a finger, whereby an aerosol is propelled forward into a masking unit.

1459828305-1eae3816-7721-490f-b8df-c0a95f680fdc

A boot method an apparatus are described which reduce the likelihood of a security breach in a mobile device, preferably in a situation where a reset has been initiated. Also provided are polymeric compositions incorporating the surfactant compounds. The memory management unit transmits the packet to a CPU through a CPU processing module. A spool may be included about which the water-support sheet may be wound when retracted.

1459828305-45ad6fa9-b0b0-4765-8c0c-4b1c6c4d7ea2

A power storage equipment management system has a power storage equipment, and a management server for managing power information of the power storage equipment. Additive concentrates according to the invention are characterized by a finer dispersion than would result from the direct addition of particulate or granular additives to the same liquid solvent. The apparatus and method further includes applying a plurality of policy-based filters to the alarms. Each physical channel is allocated at least one time slot in at least one frame of each outer-frame in the super-frame. The battery compartment comprises an electrically isolating partial cover, which is disposed on a second side opposite the first side and designed to cover a base of the battery directed toward the second side in the direction of the removal side of the battery compartment. for 30 seconds to 30 minutes to selectively lower an amount of Fe in the passive film formed on the surface of the stainless steel sheet.

1459828305-7976dbc7-c3a5-4802-8c21-9f03e44330f1

The present invention provides non-steroidal compounds of formula I which are selective modulators of a steroid receptor, specifically, the glucocorticoid receptor. According to an example embodiment of the present invention, an arrangement for processing external-services data includes an audio, video, and data signal bussing arrangement adapted to distribute audio, video, and data to designated points in a user facility. A DC bus is connected between the rectifier circuit and the inverter circuit to provide a relatively fixed DC voltage for the inverter.

1459828305-a284b970-91b2-47c4-b880-86d0ac5e294a

A nose pad of eyeglasses includes a nose rack, a fastener and a pad; an axis is on the nose rack, a sleeve corresponding to the axis is on the fastener, an insertion hole is on the sleeve for the axis to insert. In such a case, a user can effectively cause a restriction command to be generated, where the restriction command is wirelessly transmitted to the client device. Coordinate data of a slave recipe is stored.

1459828306-58b8394a-521e-4ec1-bdff-e5b1201ab635

A ball and socket joint for implanting in the body is provided wherein the socket portion of the joint can have various orientations with respect to the patient's anatomy, and the orientation used for a particular patient can be selected and/or changed in situ, that is, during or after implantation of the joint. The present invention also discloses a charge control agent which comprises the above sulfide as the active ingredient; and a toner which comprises the charge control agent, a coloring agent and a binder resin. Additionally, the canister guard may be configured to be replacable or for retrofitting to conventional liquid chemical containing canisters. such as a light, sign, alarm, or a flexible member for

marking a traffic pathway.

1459828306-5900485b-d84e-465a-8b0f-072743da68c8

A system of distributed group management for generating authentication information relating to a group to which users belong at a high speed on a client side and, at the same time, wherein a server side can verify this at a high speed. An organic insulating layer is formed on the color filters, and pixel electrodes are formed thereon. The input signals typically include a steering pinion gear angle signal, a vehicle velocity signal, and a yaw rate signal.

1459828306-9db7bb37-f9d4-4e52-9895-ea1612ce1e33

A data capture technique for high speed signaling to allow for optimal sampling of an asynchronous data stream. The imaging optical system performs a focusing operation for the distance designated by the distance designation section. The semiconductor module has cooling metal on two sides. This improves the efficiency and/or the service life of an existing steam power plant. The substances in the container are naturally fed by gravity to a dispensing portion without the need for the dispenser to be placed in a vertical position, upside down position, or inclined position in order to allow the substances to move to the tip of the dispensing portion, all the while maintaining the container in a horizontal orientation.

1459828306-9f0969a4-9e9f-4cdd-a3c3-55cf126a3599

A method of increasing the lifetime of a hydro-oxidation catalyst comprising, preferably, gold, silver, or mixtures thereof, and optionally one or more promoters, on a titanium-containing support, such as a titanosilicate or titanium dispersed on silica. The monolithic chip includes LED junctions formed from a single LED junction. For the first switch, a control terminal is coupled to a first node, an input terminal receives a first clock signal, and an output terminal is coupled to an output node. When a size of an original to be read is larger than a predetermined size, reading is performed in the ring buffer mode. An epitaxial structure is formed in the recess.

1459828306-ca403142-9bb7-4c3a-b349-2a269f9d5a52

A method for setting a cut-through optical path in an optical network system is proposed. A vehicle-mounted personal computer as the data processor is powered by a vehicle-mounted battery via a main power supply circuit. The stator has a coil of a superconducting material. According to the invention, adjacent purpose-made blocks of one or each block row are produced in the mold in such a way that axes of the purpose-made blocks deviate at least partially in the longitudinal direction of each block row from the longitudinal axis of each block row and that lateral pressure is exerted on the or each molded block row to separate the predetermined breaking points. The mounting washer forms a laminar flow delamination through which helium molecules can flow during a helium leak detection test.

1459828307-04ba1edc-ab4f-4cec-9155-db5fa68072e8

A method for making a web having a metal-ion sequestering agent and treating a liquid using the web. The system may include an implantable pulse generator from which multiple stimulating leads may extend sufficient to allow for adequate stimulation over multiple regions of the head, preferably including the frontal, parietal and occipital regions. A pair of movable electrodes of the reed switch 14 operates according to magnetic induction of a magnetic field of a magnet 6 applied substantially parallel to the direction t of the longitudinal axis of the capsule-like casing 16, and come into contact with each other.

1459828307-0bd4388f-0f44-4d36-aca1-23cb0eb4d001

The present invention enables, in a mobile communication system using \u201cEUL\u201d, to enhance radio quality by certainly allocating hardware resources at a radio base station. At least two clamps are attached to each chain

link of the link chain, wherein the clamps in the link chain are spaced apart from one another by equal spacings. The integrated inverters execute switching routines to convert the DC voltage to an AC voltage suitable for controlling the motor. The first crystallinity is higher than the second crystallinity. The third member has a spiraling face on one end and has a planar face on another end. Inversion channels form on the side walls of the trenches when a positive drain voltage and a positive gate voltage are applied.

1459828307-5a348a23-d80b-41b8-afa5-7276a6297c7f

To restore data, substantially continuous recording of input/output operations in a storage system is performed to provide an IO continuum of IO operations. The rear axle and hitch have adjustable height suspensions, allowing the trailer to be lowered or raised uniformly while remaining hitched to the towing vehicle. on its bodywork, and comprising an essentially non-conductive protective screen, the element being characterized in that behind said protective screen if further comprises an electrically insulating film having two faces, each of which is covered at least in part in an electrically conductive material. The system may also identify capacity problems within the future expected wireless system due to unbalanced traffic loading or overloading of traffic within the future expected wireless system. Furthermore, the system and method can detect changes in atrial wall fibrosis that can indicate a continuing degradation in the atrial wall health and an increasing likelihood of atrial fibrillation. Through the elastic pressing members, hooks and locating plate, the fastening element is clipped the bracing seat.

1459828307-9c8a9089-3b50-42f8-8ab6-d78a5aa92533

An improved composition for and method of priming a concrete pump line is provided. The first quadrant has positive motor torque and positive motor speed. The outer shell may have an inner shell forming an insulating air gap. Groove structures which are located on at least one of the major surfaces of the light guide permit redistribution of light around obstacles that may be present within the light guide structure, thereby maintaining brightness uniformity of the backlight or illumination panel.

1459828308-030d3d8d-9922-42f0-b14c-964c7f613583

A system for generating a digital output signal representing a captured image includes a sensor for capturing the image and generating a sensor output signal. The color of the new dyes and conjugates thereof can be varied over a wide range. The method uses a set of reference gases and their calculated density and speed of sound values to estimate the density of the subject gas.

1459828308-4659c049-1dce-49ac-9062-6ee3ca4cac3b

A method of generating high-power laser output in the 1100 to 1500 um spectral region having a controllable linewidth. The first MISFET has a first gate insulating film arranged over the semiconductor substrate, a first gate electrode arranged over the first gate insulating film, and a first source region and a first drain region. A back panel forms part of an instrument housing for housing the instrument, a first portion protrudes rearward from the back panel and a first recess is carried by the protruding portion. This is particularly useful for mobile phones used on cellular networks utilizing high data volume on the allocated spectrum. A pair of source and drain regions are then formed in the semiconductor body on opposite sides of the gate electrode. Radio-frequency transceiver circuitry may be coupled to an antenna feed for the antenna using a radio-frequency transmission line.

1459828308-5b80396c-8930-45bc-94c7-8083fbf9210b

Methods and apparatuses for controlling application programs are described. The power safety system includes a power safety instrument having a power required indicator and a power available indicator, each being located on a display. Namely,

the predetermined conduct of the auxiliary device notifies completion of registering the ID code, which results in enhancing operation efficiency in registering of the ID code.

1459828308-5b877fa6-40dc-4b18-a732-c39a616b45b9

A verification system, method and computer program product are provided. Image statistics inherent to the image are used to compute the size reduction as a function of the quality scaling factor. This additional degree of freedom permits variation of the camber angle independently of the suspension spring movement and of the deformations of its elements. Search criteria is input to the communications facility information system by the user, the search criteria being related to equipment data or customer data.

1459828308-d13fb27a-e2ea-44ed-a284-6ba75461f972

An integrated control circuit for a charge pump includes a first device for regulating the output voltage of the charge pump and a second device for increasing the output voltage from the charge pump with a set ramp. The apparatus includes a photosensitive drum, a laser optic system for tracing an image on the photosensitive drum, a toner supply electrically charged opposite the image traced on the photosensitive drum, and an ultraviolet light source for imparting energy to the toner to fuse the toner to the page. A transition from the temperature of the bond-strengthening anneal to the temperature of the heat treatment may be achieved at a ramp rate above 10°C. The leak path is preferably upstream of a check valve.

1459828309-0f5dae0c-259a-4ff9-b11c-c6f674d5d0b8

A charging stand for selectively enclosing and exposing an appliance such as a hair trimmer having a rechargeable battery includes a base and a cover. The pressure-sensitive adhesive layer contains a branched monoalcohol having from 12 to 28 carbon atoms, a free base of bisoprolol and a polyisobutylene pressure-sensitive adhesive. The left and the right part releasably link to one and other when the shoes are correctly oriented. The order handling system may also provide to the ordering entity a notification for a particular item. Based on the foregoing and the size and shape of the image portion occupied by the object, such as the height of an edge or its surface area, relative to another object or a reference, the device may calculate its location.

1459828309-27f9c767-d182-4c45-940a-713b52042ea1

Described herein are materials for use in electrolytes that provide a number of desirable characteristics when implemented within batteries, such as high stability during battery cycling up to high temperatures high voltages, high discharge capacity, high coulombic efficiency, and excellent retention of discharge capacity and coulombic efficiency over several cycles of charging and discharging. In one aspect, a speech-enabled application generates a text input including a text transcription of a desired speech output, and inputs the text input to a speech synthesis system. The invention further comprises methods of making the herbal composition and methods of use for the treatment of arthritis and inflammation. The output voltage is used for RF signal detection at all RF signal levels. However, the interconnecting transmission lines and the load resistor may have different impedances than the photodetector and modulator.

1459828309-4debbfa2-7a8f-4043-b2bf-163426f15362

A differential pressure sensing system is provided. The communication session information may be mapped to the end user in order to generate a quality of service attribute to be communicated to a next destination. Systems, methods, and programs for detecting unauthorized use of a text communication device or account may sample a text communication generated by the device or account during communication, may extract a language pattern from the audio sample, and may compare extracted language pattern of the sample with an authorized user profile.

1459828309-52e99cc7-82a9-4928-aa8c-cd25f5e01297

A method and system in a multithreaded processor for processing events without interrupt notifications. The tray is rotatably mounted to a support which in turn is adapted for attachment to an appendage of a user. The control unit incorporates a timer and a switch unit control block, the timer having a nominal operating time of the load, at the lapse of which the switch unit shuts off current supply to the load with the provision that the current supply has not already been shut off by the load control switch proper. The mantle surface has two recessed parts running peripherally therearound to receive embossed parts of the pipe end for rotational movement between the pipe end and the pipe casing. Replicating the second change to the secondary volume involves recording an order of the second change relative to the first change.

1459828309-6eff24c8-cbb5-48f4-9450-921635435911

The present invention relates to a fastening device for fastening a component to a brush carrier for an electrical machine. The heatsink assembly is mounted in heat exchange relation with a heat pipe by being on or adjacent a heat pipe. A virtual illumination equation takes into account light attenuation, lambertian and specular reflection. A gateway service then receives the SPARQL query results from the SPARQL endpoint and transforms the SPARQL query results into a format corresponding to the first query language format so the initiating application can process it natively. A cover arranged with the flight lighting arrangement can substantially prevent the light from the flight lighting arrangement from being visible, from the ground, in a region around the wind power installation. In this manner, traffic is routed around failures via local switching operations.

1459828310-07de619c-a5a8-4a9a-90f2-c831988ca4cd

The invention is a system and method of transmitting control information and user data, relating to multicast or broadcast services, between a first information entity within at least one mobile station and a second information entity within a controller of a wireless network in which the at least one mobile station is located. A budget of unreserved cycles of battery charging and discharging is determined, taking into account the rated battery life in terms of both time and number of cycles. The second byte select line is configured to be driven to a low voltage level when the first byte select line is driven to a high voltage level, thereby minimizing or eliminating any parasitic voltage coupling between adjacent rows of memory cells. A spring-loaded detent button is movably secured to the filter cap and extends into the filter chamber. The controller controls the energization by periodically switching the driving current to each of the divided induction coils on the basis of an energization signal that determines the permission and the inhibition of the driving currents according to a signal of temperature detected by the temperature detector, and the switching signal. A pair of islanded floating gates are disposed on the gate oxide layer at the active area, with a gap between the pair of floating gates and the pair of selective gates.

1459828310-29a993ef-c127-4581-a2a9-7c2ba77a41e7

A charge air cooler for an internal combustion engine is disclosed. In one method for disabling data on a radio frequency identification tag, an RFID tag is identified and its identity is confirmed. The crystallization stage may also be cooled by an ethylene refrigerant, which has been cooled by heat exchange with a substantially liquid stream comprising ammonia. The opening is capable of controlling movement of the at least one moveable composite insert in a desired direction during thermal expansion of the composite part, when the guiding mechanism is received by the opening. A motor drives a cam to position the lever arm to free the latch receiver from the locked position. Accordingly, performance of the receiver is close to that of coherent detection and is much better than that of the conventional receivers which do not consider more than one consecutive block.

1459828311-218dc2e3-0647-4ba5-894c-6724b0f5fd0e

A display apparatus, three-dimensional glasses, and a display system including the display apparatus and the 3D glasses are provided. The apparatus includes: a staging latch accommodating m bits, e. The predetermined area of a semiconductor blank is doped with a dopant until a concentration of the dopant is obtained that is at least as high as the target concentration of the second region.

1459828311-6598e6cb-6cd2-4019-b7a9-946b0fb0925b

The invention provides an integrated circuit that permits input of a signal of a potential which is higher than a power supply voltage supplied to an interface circuit and also higher than a maximum rated voltage allowable for a gate electrode of a transistor forming an interface circuit, even in a non-access mode. Each wheel tire is driven by a motor drive unit employing a shaft-mount gearbox with a motor brake that utilizes the reduction of the drive gearbox to increase the effective braking torque developed. The engaging element is biased by a prestress against the curved path of each of the curved-path carriers in the essentially unloaded neutral position of the transmission. And the radiation safety of the present invention is good. A plurality of actuators may be provided, with each of the actuators being associated with one of the ejection structures. The phase-division based controller divides each pulse width modulation of each channel into a tracking phase and a pre-charging phase so that the LED bus voltage supplied to the multiple channels changes between the tracking phase and the pre-charging phase.

1459828311-9633e18b-0031-4128-bd72-dd29c82f5330

System and method for automatically parallelizing iterative functionality in a data flow program. The polyester resin is prepared from high purity terephthalic acid having a particle size distribution described by a Weibull function with narrow ranges of characteristic size and shape factor. The independent temperatures allow for the growth of nanoparticles in a controlled environment avoiding spontaneous nucleation and allowing particle sizes to be controlled and facilitating the manufacture of particles of a substantially uniform size.

1459828311-fc847c91-dca3-4860-8934-f8c8c89272b7

A female coupler and a male coupler of a pipe coupling that are easy to assemble and have a minimized passage resistance are provided. When it is determined that an execution condition is satisfied, a pattern acquisition is executed to form a pattern image on the bearing body by using an image forming section and to acquire characteristics of the pattern image based on detection results. The scene image and affective information are transmitted to an image receiver. The magnetic drive metering pump has a reference element associated with the thrust member and diaphragm, the position of which reference element is detected by a positional sensor.

1459828312-179e3357-6844-4796-870f-853878e06bf9

An electrostatic chuck 108 is provided on a lower electrode 106 provided inside a processing chamber 102 of an etching apparatus 100, and a conductive inner ring body 112a and an insulating outer ring body 112b are encompassing the outer edges of a wafer W mounted on the chuck surface. The sail panel may be attached with an inflatable curtain of the curtain airbag system. The hardware may also be specially tailored to the services required by the database server.

1459828312-4fd711e1-1998-4df9-8bde-4bdda4dba7f5

A flexible circuit assembly is provided which includes a flexible circuit, a substrate of a capacitive-sensing device and an electronic component that are coupled to the flexible circuit. The authorization data is provided in response to FAP authentication data. A second bias switch is coupled to the second node.

1459828312-83230383-694c-4395-9689-c97e46083ce3

For use in a printer, a system for, and method of, incorporating an advertisement into a printout and a printer having the system or method contained or carried out therein. The top wall includes aligned, spaced-apart openings on at least one side of the support wall which are sized to receive sample tubes. This reference position can then be employed in a second step for determining the accurate position of the receiver. An adder removes the estimated DC offset from the digital signal. The ACC system further includes a prediction system for predicting a conflict situation in which the controlled target distance cannot be maintained, in which case the take-over request is initiated before the conflict situation actually occurs. The image data is read out of the first memory and is inputted into an R channel and a B channel at an identical timing.

1459828312-e9fdd5a5-fbf0-4245-904f-52fc42748187

The present invention relates to methods and systems for the analysis of the dissociation behavior of nucleic acids and the identification of nucleic acids. The apparatus is characterized in that it further comprises a sensor device set up for recording a remaining pattern of the coloring agent on the carrier film after the heating of the carrier film and set up for generating a sensor signal on the basis of the recorded pattern. A plurality of interpolated pixels may be generated in a previous frame, which corresponds to the interpolated pixels in the current frame. The first switching device is electrically connected to an adjacent gate line corresponding to an adjacent pixel. When the division-logic circuitry of an arithmetic logic unit in the corresponding communication device is not designed to handle operands that can accommodate the length of the timestamp and/or stride values, the header-compression method can advantageously be used to improve the speed and efficiency of timestamp compression in communication devices.

1459828313-825db281-0221-4501-aa02-625b293fc3ff

A Management Information Base in a computer device adapted to use Simple Network Management Protocol. The seating system includes aspects to improve the functionality of the seating arrangement while maintaining the safety and comfort of the automotive seats. The flap is of such a length that the carrying case portion of the carrier can be rolled up so that the phone is engaged tightly against the belt loop and belt when the flap is engaged in the closed or sealed position.

1459828313-c9e5db87-8e5b-4327-82ae-d5b67083a2b8

A method and system for managing attributes in a streaming application is disclosed. Semiconductor devices are processed based upon control input parameters. When the defibrillator is activated, the first energy dosage in the sequence is administered to the patient. A band-pass filter connected to the LC resonance circuit filters the transmitted signals and control signals. The invention has the advantage that the check valve can be simply and inexpensively manufactured. Many types of metadata can be returned, including ratings or other metadata related to the target content item obtained from users, popularity data specific to the target content item, information about previously submitted forward search queries that led to the target content item being identified as a hit, and metadata extracted from the target content item.

1459828314-f39e8c63-4c6b-4bfc-b159-ddf04a66dc7b

Devices in accordance with certain embodiments of the present sulcus speculum are designed to be placed into the sulcus of an eye to perform one or more of the following functions: evacuation of fluid, opening of the lids, and application of drugs such as anesthetic or antibiotics. The composite grain has a sea-islands structure in which the lithium iron silicate crystals or lithium manganese silicate crystals are scattered like islands in the carbon material, and the islands have an average value of circle-equivalent diameter of smaller than 15 nm. Also, in further embodiments, the particle collections have particle size distribution such that effectively no particles have a diameter greater than about four times the average

diameter of the collection of particles.

1459828314-faeb25e0-9d76-4368-856a-ebb9235fbbc3

A method and apparatus for a supercharger wherein pressurized air originating from the compressor side is fed into its gear box for draining the oil therein due to the reduced size of the gear box. The system includes a database having information for a plurality of machines. A second motor is secured in the second leg and is in communication with a second gear train, which is rotatably attached to the torso such that when the figure is in the standing position, the second motor causes the second leg to move in relation to the first leg along the axis. The use of the bump grid array or conductive ball connections significantly reduces the amount of internal wiring required. The 1\xd7N MEMS provides for protection switching. Each slice includes a mode port that receives mode control signals for dynamically altering the function and connectivity of related slices.

1459828315-668eacb3-d03c-43c7-b9bb-c4fb622a3e01

A disk device includes a frame, an optical pickup and a shock absorbing component. The tank barrel includes a valve assembly and a valve assembly protection box. The second precharge unit applies a clamp voltage, which is generated using a first supply voltage, to the pair of local inputoutput lines, in response to the first precharge signal, to precharge the pair of local inputoutput lines. The faults can be related to one of the hardware, the cash reject rate, image handling, crash rate, user claim rate, and check handling accuracy of the machine. When writing a pattern, an operation part determines the number of mirror blocks to be used where scan speed can be maximized, in consideration of required time for input of the writing signal to the DMD and light amount applied on the substrate.

1459828316-4045c6cd-0462-4d23-bee9-0cef0f8431af

A source frame signal received at a first frame rate is converted to a destination frame signal output at a second frame rate. Thick gate dielectric layers separate the top surface and opposing sidewalls of the channel region from the gate conductor in order to suppress conductivity in the channel planes. Additionally, system calls intended for operating on the data are produced, utilizing an application. Under broadcast control, local computers, combine user information selectively into prior art communications to exhibit personalized mass media programming at video monitors, speakers, printers, etc. Prior to joining the two spherical cavitation chamber halves, the surfaces to be mated are finished, preferably to a surface flatness of at least \xb10. Simultaneously provided is a large-capacity magnetic storage system capable of high-density recording with a recording density exceeding 20 Gbinch<sup>2</sup>.

1459828317-6b8b6dbb-afaa-409d-b344-0d31f50b100c

A fire retardant polymer composition is provided. The load control system includes a plurality of keypads, which each may include a different button assembly having a different button configuration. The coating may have porosity of greater than 15% for improved thermal shock protection. Not only does this damage necessitate expensive repairs, but serious threats to life safety are imposed when debris falls from a damaged wall system. The right arm extension is wrapped around the baby carrier such that the right arm extension passes to the left between the two shoulder straps of the baby carrier and the wearer.

1459828317-7a204f75-f445-4438-81f4-5ec143a91fca

An intelligent spectrum management system and method are provided that includes sophisticated features to detect, classify, and locate sources of RF activity. The UV irradiating device includes a UV light source part having a UV lamp and a reflecting plate, a support supporting the UV light source part, and a stage on which a substrate is placed, the UV light source being irradiated at a tilt angle upon the substrate. When the control pressure is greater than 50% duty cycle the locking pin disengages and the VCT moves away from the mechanical stop. Accessed is

data that includes a graphical file containing eye diagram information corresponding to the test parameter. The ventilation outlets are disposed between the two assemblies of the baggage compartments. One or more fasteners can be used to attach the edging panels to the tab of the connector, joining two pieces of edging via the connector.

1459828318-5549befe-ab1c-4d07-a17d-ce468f48101c

A sheet storing portion is maintained in a state in which a sheet stacking portion on which sheets are stacked is electrically insulated, when the sheet storing portion is contained in a containing portion of an image forming apparatus body at the time of formation of an image. One example includes a first retaining member with a first looped retention arm configured to apply a retaining force in an x-direction to the replaceable part and a second retaining member with a second looped retention arm configured to apply a retaining force in a y-direction to the replaceable part. The transaction system is able to respond to both spikes in rate of received transactions as well as more gradual changes in the rate of received transactions and to automatically adapt to stable storage device performance variations. Another exemplary preferred chromophore includes an electron donor group, an electron acceptor group, and a bridge structure therebetween, with the chromophores having no carbon-carbon double bond between the donor and the ring bridge. The power unit assembly includes a moveable piston adapted to engage the die block so as to move the second die towards the first die during a swaging operation.

1459828318-f28a6822-578c-407f-99a7-4c0e0d4d80ff

A scan-to-scan integrator for use in radar apparatus comprises means for defining a search window for use in verifying a candidate detection. The method then checks for inconsistencies and corrects discovered inconsistencies in each of the local counters while the file system remains online and available for use. In other variants, the invention provides an apparatus, a constrained rate receiver, a transmitter and a signal. Methods for producing a maize plant containing in its genetic material one or more traits introgressed into 39B93 through backcross conversion and/or transformation, and to the maize seed, plant and plant part produced thereby. Thus, with respect to the images of the scene captured by the camera, it appears that a single and continuous light source is moving along a path that is dictated by the configured arrangement of the array, as well as the sequence of illumination for the discrete light sources of the array from frame to frame.

1459828319-01ff1209-1999-4c94-a83f-1bf8df13b25c

A capacitance type humidity sensor includes: a detection substrate including a detection portion on a first side of the detection substrate; and a circuit board including a circuit portion. The switching period of the clock signal is based on a charging time plus a discharging time of a capacitor included in the timing circuit. The railcar stop is further configured to be selectively movable in the first direction along the rails from the second position to a third position to thereby disengage the railcar stop from the tread of the least one of the wheels. An activation circuit determines whether or not the activation signal has been received by the first power supply connecting circuit on the basis of a voltage between input terminals of the converter circuit and activates the control circuit when it is determined that the activation signal has been received by the first power supply connecting circuit.

1459828319-83cc5a2a-3095-482f-a60f-32f65a64cafd

A method for invisiting objects includes receiving information indicating an intersection between a first object and a second object. Interchangeable anterior and posterior axle units are designed to position the toy vehicle at a ground clearance that proportionally resembles a full size vehicle ground clearance. A system and method for tracking manufacture of individual stents is also provided.

1459828319-de41424e-ea69-4b9d-a878-0e45eace558a

There is provided an information processing terminal that has a plurality of data communication portions that receive data from a readwrite unit by a non-contact method. A plurality of stacked planar optical waveguides are used to guide light from an inlet face to an outlet face of an optical panel. Optionally, other additives may be included, such as accelerants, retardants, dispersants, and the like. The tray device includes a rotatable tray that alternately provides a tray and a writing surface.

1459828320-00d0085f-bec7-4674-8abd-8215eda78504

According to various aspects of the present disclosure, exemplary embodiments include assemblies and methods for dissipating heat from an electronic device by a thermally-conducting heat path to the external casing via one or more portions of an electromagnetic interference shield and/or thermal interface material disposed around the device's battery or other power source. The network may utilize a polling communication protocol such that under heavy traffic conditions, a roaming terminal wishing to initiate communication may be required to determine whether the channel is clear by listening for an entire interpoll gap time. The invention detects sequences of test sound frames having distortion levels that are greater than a temporal distortion threshold and calculates an average length and a maximum length of these sequences.

1459828320-1415975d-d349-4d4d-944c-258af9ff4ab1

Systems and methods are described herein for enabling a burst mode in a printing device to accelerate a first page out time for a print job. Longitudinal ends of the body define coaxial openings. Each available pointer in the listing of pointers references a particular free kernel memory location.

1459828320-96b5fb2e-b23b-46a2-a0f1-e14fa326297a

Digital circuit is synthesized from algorithm described in the MATLAB programming language. Aspects of one method may include providing power to a first of a plurality of voltage islands, and individually controlling providing of power to each of a remaining portion of the plurality of voltage islands. A focusing lens system focuses the illuminating light beam on a region to be examined of a sample. A display device presents images of the maximum slope superimposed with altitudes of a projected flight plan. A radially outwardly directed and radially inwardly reflective surface extends generally from a front edge of the axially forwardly directed frustoconical light-output surface to a rear edge of the radially inwardly directed frustoconical surface.

1459828320-c51395c6-cac8-45df-a972-105a9d8462b4

A method for editing a title recorded on a digital storage medium. The web-centering apparatus has a support member, a tracking assembly, and an alignment mechanism, each contained within the internal aseptic area of the packaging machine. The depth sensing pixels may include mechanisms that prevent regions of the substrate from receiving incident light. The detection unit is disposed between the delivery unit and the medium stacking unit in a medium conveyance direction, and detects an amount of the medium delivered to the medium stacking unit.

1459828320-cbbae573-7f46-4caf-a8d2-481d8954ef07

Methods and apparatuses are disclosed for refining groupings of edge points that represent contours in an image. The device includes a solid body, a bracket and a decorative float. The filter, error generator and NLMS filter-definition generator function together as an adaptive estimator. In response to identification of the content item and the user identity, the request processing component directs a recommendation engine associated with the system to identify the content related to the content item and the user identity. Each resource supports one or more of the modules, and prioritizes operation of the supported modules according to the

corresponding assigned priority levels.

1459828321-007e3f63-426c-4c18-8559-7ef025c60e63

Described is a method and system for analyzing throughput of a production line. A plurality of instructions is processed to parse a first sequence of instructions comprising a first area of interest. By using embodiments of the present invention, a standard MIB can be re-used for operating APIs, thereby costs for managing the APIs are reduced. The accumulation states are characterized by a high electrical resistance. The first substance may be dialytically freed from the cryopreservation fluid at a user desired time. A dual-band variable oscillator is used to tune signals in receive and transmit mode.

1459828321-c53da672-01f7-42f5-9eb1-112d8d9e8967

An installation and method for halal killing poultry, such as chicken, turkey, duck and quail, includes the steps of: i) suspending the poultry with the poultry head down; ii) positioning the suspended poultry head via a V-shaped positioning element; and iii) killing the poultry near the suspended and positioned poultry head, optionally the poultry may be prestunned. The support rod has a removal preventing projection that may prevent the visor body from being removed from the support rod. A reference field picture having a same parity as the current field macroblock is selected if the reference field picture index is an even value. The electronic image pickup system also comprises an electronic image pickup device I located on the image side of the zoom optical system. Various improvements for more reliably and consistently inflating the containers are also disclosed.

1459828322-2d1abe7a-4af6-4e22-8e2c-50ed48871773

A manual transmission for a four-wheel drive vehicle transmits a power to a front drive shaft for driving front wheels and to a rear drive shaft for driving rear wheels through a propeller shaft. A first and second earpiece is attached to the first and second end of the headband, respectively. The filter mirror assembly is so mounted that a rotation thereof will not alter the optical path the beam positions of signals resulted from a rotation of the filter mirror assembly. The nonlinear site flow context development module can then correctly determine the actual user flow during a Web session and develop an accurate context of the user's session. The system provides a decision assistance interface for interactive management of the file access control and for tracking abnormal user behavior. Then, by measuring the gate dielectric properties and then correlating those measurements with the underlying fin dimensions, a relationship between fin dimension and gate dielectric properties can be determined.

1459828322-8222c481-b24b-4dd5-89ca-9afb9e55bb8d

A unitary control for operating at least the fan and compressor of a climate control apparatus in response to signals received from a thermostat. The vacuum system has a vacuum head and a vacuum nozzle. The non-magnetic middle layer is formed of a non-magnetic oxide or nitride, and is disposed between the non-magnetic base layer and the magnetic layer.

1459828322-a1ac3e94-7ba0-4339-9568-a6a4ded5ad3f

Systems and methods of processing write transactions provide for combining write transactions on an input/output hub according to a protocol between the IO hub and a processor. A pair of dry fiber preforms are placed on a tool with a thin film adhesive layer therebetween. An earth terminal, which comes in contact with a body side earth terminal formed in the protruding section, is formed in the hole. The disclosed SLA template may further include a number of SLA defaults, which may consist of default values and or software program code logic. Another aspect of the invention concerns a pharmaceutical kit comprising oral dosage units that contain the aforementioned estrogenic component and a progestogenic component as well as an androgenic component.

1459828322-a54655ff-b462-4c88-8d2e-e747304011eb

A vehicle, such as a motorcycle, has a structure in which strength of a body frame is increased and positional accuracy between members constituting the body frame is improved. The font is accessible for the printing of MICR characters when the toner cartridge is installed in a printer. 04 molehour without loss of selectivity is disclosed. The thickness of the guide plate may be gradually reduced or constant toward a free end of the guide plate. At the second larger diametrical size, the gelatin or collagen material can occlude a vascular vessel for a period of at least 20 days without degrading. The carrier plate and the metal plate are then joined, and the connecting ridges are then parted.

1459828322-dc4e6ce8-d804-4835-9b4b-747310e7e21d

A dynamic carrier selection method and system permit units operating on a first carrier to change to a second carrier when performance of the first carrier becomes unacceptable. A layer jump control method of the optical drive is also provided. In a second aspect an adaptable device is disclosed.

1459828323-28bd046a-8945-4338-904a-6894402c66ed

Disclosed is a friction-stir welded structure in which corrosion resistance of a peeling region is ensured when a film coating is peeled away from a steel sheet. The planar board has components on one face thereof oriented toward one face of the chassis. The computer program further includes logic configured to verify that the rows of the initial structure are linearly independent and logic configured to apply an orthonormalization procedure to the initial structure to obtain a space-time structure.

1459828323-586dd197-605b-4f16-bedd-81e46ebc20f4

A personal wireless device is utilized to carry out measurements of one or more network-performance related metrics in response to a triggering event. Upon detection of such a conflict, a new foreground color is selected in accordance with a predetermined legibility criterion. Furthermore, the data is arranged such that no one data storage device stores both the primary and mirrored copies of the same chunk of data. The first cross-sectional area is at least two times greater than the second cross sectional area. One side of the compartment is substantially flat to enable the transportation of persons or materials, and has a number of handles to facilitate transportation.

1459828323-ce647c06-931d-4427-b03c-62c9619d1840

Method of measuring the weight of bulk liquid material within a container of a tractor-trailer combination in which air bag pressure of a pneumatic suspension system is sensed and correlated with the weight of the bulk liquid material within the container. The tensioning system has a mechanical stop that limits retraction of the actuator, and thus limits how much slack can be created in the endless track. The implantable medical device may include a target that creates an internal magnetic field for the compass to interact with. The second section includes a groove part which is configured to position the wire therein and an extending part which is extended from an edge of the groove part and closes an opening of the groove part so as to form a tubular structure.

1459828324-1371dbc8-8f84-4e1f-86fb-75e835277a3c

A system and method for providing quality assurance for interactive television and software application data packages delivered via a network. The method may be used to display tables on a small footprint device, such as a smart cellular phone, a personal data assistant, a handheld computer, etc. When the first case 1 and the second case 2 are kept in an open state, the display unit 5 on the first case and the key input section 7 face in the same direction, and the image pick-up unit 121 faces in the opposite direction to a display screen of the display unit and the key input section. The pre-processor may be implemented in the form of an interpreter which selects and executes a script that includes language- and scenario-specific

instructions for performing linguistic and semantic analysis of the text.

1459828324-38a36e12-f610-4a58-821c-67c1684ff2eb

Elevator reassignment information is communicated to passengers in a group elevator system. The detection device has at least in one previously selected acquisition configuration, a degree of pixelation in the detection plane greater than 1 and a collimator-detector distance greater than one tenth of the septal height of the collimator. This method comprises the step of subculturing a cultured cell in a culture medium containing thidiazuron in an amount effective for inducing callus formation.

1459828324-6c04b4f2-6c8a-4dbd-8c61-1bf28e716766

The present invention relates to a surface interaction type multimode optical fiber coupler. A container configured to reside in a standard chlorine tablet dispenser is filled with a disinfectant solution, which contains a disinfecting substance as an active ingredient. The calculated sampling frequency is a frequency that makes it possible to complete simultaneously the reproduction of the combined JPEG data and the combined audio data.

1459828324-e109a03a-6e9e-4159-aa45-1994859c49c8

Systems and methods for delaying automatic playing of a video based on visibility of the video are presented. The flow detection method uses a device comprising a processor associated with a flow sensor and a memory which stores predefined flow criteria. Abstract representations of financial assets are used to obtain instances of defined financial-asset object classes to define pools of financial assets with common abstract characteristics.

1459828325-2d963714-b05d-427d-877d-4e990f14ac32

A developing device includes a first developer holder and a second developer holder. A diameter of the expanded tubular section is controlled by controlling a fluid pressure in the annulus. Light energy is transmitted in a narrow swath across the portion of the surface having the standardized features. in an amount of from 10 to 40%, is provided to the surface of the ink-jet recording sheet in an amount of 20 mlm<sup>2</sup>, .

1459828325-79537e14-e37d-4a47-8572-8c93b2cc731a

A liquid crystal display device includes a panel, a heater, and a temperature detector. Each PEM cell may include an anode portion and a cathode portion separated by a portion of the PEM membrane. A stiffener may be arranged in-line with the vulnerable seams and fixed to the encapsulated array opposite to the seam protector. Then, the amplified voltages on the digit line pair are equilibrated with an equilibration circuit. The flame retarded compatibilized blends exhibit desirable dielectric properties, are flame resistant and exhibit low smoke emission. The fly-drive vehicle also includes a landing gear assembly for raising and lowering the pair of wheels with respect to the vehicle body and a folding rotor shaft assembly for raising and lowering the rotor with respect to the vehicle body.

1459828325-c0c5bd43-8e91-4d01-bb91-388c974b3413

In the process for producing methionine of the present invention uses, as an equipment material for a step of hydrolyzing 5-hydantoin in the presence of potassium carbonate to produce methionine, a stainless steel containing 21. The device includes a first infrared detector, a second infared detector, and a controller. In one application, for example, an embedder process steganographically encodes data into an image as part of the process of uploading the image from the image capture device to external storage. It also includes the innovations of using speech recognition of one or more letter-identifying words to alphabetically filter handwriting recognition, and of using speech recognition to correct handwriting recognition of one or more words. An obtained product is utilized for updating

above described respective tap weight coefficients. To improve the function during rain, the passing of a windshield wiper through the camera image be used to classify individual images and/or portions of images as being of higher or lower quality, in order to improve the quality of the images from the camera.

1459828325-d2af8d65-6f02-4c63-8cdd-3c4b9b9bae9e

In an image forming apparatus, a page data generation unit is configured to generate page data of a job list screen that includes a link to the page data of a detailed information screen on an uncompleted job. An access control automaton generation unit generates an access control automaton from an access control policy; a schema automaton generation unit generates a schema automaton from a schema; and a logic operation unit performs a logic operation related to each of the generated automatons. A determination is made whether the inline parameter would result in a value of a device operation parameter within a predetermined range. The speech signal having a pitch fluctuation can be compressed in high quality and high efficiency by coding or synthesizing the speech wave signal using the pitch wave signal creation method of the invention.

1459828326-c9e9fa05-a0e1-4e2e-9931-8aed4a88d5a3

Compounds, compositions and methods for the treatment of retinal degenerative diseases, such as retinitis pigmentosa, Leber's congenital Amaurosis, Syndromic retinal degenerations, age-related macular degeneration and Usher Syndrome, and hearing loss associated with Usher Syndrome are described herein. A computation unit determines, with the aid of information provided by the information source, an energy reference profile having a trajectory reference profile and a speed reference profile that allows the aircraft to regain a stabilized approach trajectory, if it follows the reference profile. The top and base plates are joined to the connecting material by means of a foaming adhesive which fills the cavities remaining in the composite. The text clustering is performed using seeds based on the conceptual guidelines.

1459828326-cdc20883-2890-44be-8e07-8ed2dded68bd

A tool for driving headed fasteners has an opening in the tool. The method determines a type of the word sequence constraint based on the shape of the gesture and determines a value of the word sequence constraint based on the location of the gesture. The first ad unit is caused to display at the particular user computing device. Based on the calling party number of a call, the network can determine if the call should be terminated as an information service call or a regulated PSTN call. In order to allow in a simple manner an improved web guidance and sliver quality, and to permit the web guide to be adapted to different technical parameters, such as fiber material properties, working speed, a parameter relating to contact between fiber structure and inner wall is alterable.

1459828326-fb21ca86-05dd-4715-af0e-24cbd7dc198f

A method for inspecting electrical circuits, and a system for carrying out the method, generating a representation of boundaries of elements in an image of an electrical circuit which is under inspection, and analyzing at least some locations of at least some boundaries in the representation of boundaries of elements to identify defects in the electrical circuit. The top support and first edge support make-up a first support section. , and forming the via interconnection.

1459828327-665eaabc-4ba2-4cec-b742-a8f4de3a0271

An on-vehicle electronic device control system includes a base-device-layer on which base-inputting-devices and base-driven-devices are disposed and plural control layers on which plural control units are disposed. With such a circuit design, the current through the first and second LED can be phase shifted compared with the current through the third LED circuit, so that the first and second light emitting diode circuits emit light during one time period, while the third light emitting diode circuit emits light during a second period. The extreme temperature

gasket generally includes an inorganic filler, an inorganic fiber, and an organic binder.

1459828327-6e0cbb8c-0dc8-4f19-aaa8-1051ed1a3f1f

An adjustment stop screw or bolt is provided for adjusting the full forward speed position of at least one steering lever on a skid steer loader. In an exemplary embodiment of the invention, the method includes removing, from the array area, an initial pad nitride material formed on the device. When the first set value corresponds to a fast boot mode, the BIOS performs a fast boot process, in which the fast boot process is interrupted when the BIOS receives a system control interrupt. The outer camshaft piece also defines a hollow extending a length.

1459828327-7c9c956d-659a-406b-9f07-b0f79d001b16

A CPU of a personal computer operates as a driver of a color printer main body in accordance with software processing based on a printer driver program installed in a hard disk unit. The first signal has an amplitude range between a second power supply potential, which differs from the first power supply potential, and the ground reference potential. The housing includes a water inlet in fluid communication with the upwardly opening chamber that functions as means for coupling water from a separate source of pressurized water to the upwardly opening chamber. The tentative path uses a first DFE device and a reflection cancellation circuit to generate a correction signal for removing reflection signal from the digital data stream. The plural image processing devices and the control device are composed respectively on different units, whereby the structure of the apparatus can be easily changed, and a decrease in processing speed due to the competition for buses can be reduced without increasing the number of parts necessary for bus control.

1459828327-a570b445-4201-4a0c-b118-f6ce6eccb9c8

A shock-absorbing adapter for connecting a fifth wheel or gooseneck trailer to a towing vehicle including a lower plate, an upper plate, first and second guide means, cushioning means, a first coupling mechanism for releasably connecting the lower plate to the towing vehicle, and a second coupling mechanism for releasably connecting the upper plate to the fifth wheel or gooseneck trailer. The end cap is configured to allow the endoscope to be introduced into a patient body by a short-wire type of operation. The first doped layer includes a first plurality of protrusions extending from a first connecting base portion. An IR-LED distance measuring sensor is mounted within each bin for generating an output which is a function of the level of paper present in the compartment.

1459828327-bcc27b71-6685-4319-961e-b1fee924d450

A flexographic printing machine having at least one inking unit in which the setting of the printing position of the format cylinder and the anilox roller can be achieved by adjusting the format cylinder to the impression roller and the anilox roller to the format cylinder using adjustment equipment. The adapter has a cavity that has four sides and four corners, and a lower portion consisting of four flaps. In regard to a small block in which interframe predictive coding has been performed, an image-quality degradation estimation unit estimates the degree of image-quality degradation that will be caused in this small block in the decoded image. Transistors in the first output signal chain and the second output signal chain are fabricated using corresponding gate oxide characteristics. The counter shaft is pivotally supported in the lower crankcase, which is positioned on the lower side of the cut surface BF. The processor consequently avoids race conditions in the system and allows the parallel execution speedup of programs written for a sequential machine such as a PLC.

1459828328-2476eb3a-e9a0-4869-b30e-54ffd23b98f8

A mobile storage tank includes a wall, a platform secured to the wall, and a structure that provides ascending access to the platform. A method for amplifying

the production of cobalamines, and particularly coenzyme B12, using recombinant DNA techniques, are also described. The slider also includes a separator finger depending from the back between the pair of sidewalls and shaped along its length to first press together a bottom of the male and female profiles and then roll the profiles closed toward a top thereof as the slider moves toward the closed condition.

1459828328-3559fae8-d89e-4787-beb5-1617a593dc65

A programmable logic device architecture providing efficient configurable functionality to allow the \u201ctie-off\u201d of logic region-wide control signals. The termination fixture provides an interface that exposes portions of the drive member to direct movement by an external system that may include a manipulator and a sterile barrier. The receiver includes an optical hybrid that combines a received optical signal with a local oscillator signal, a detector that recovers components of a complex signal, a processor that receives these components, and instructions that cause the processor to process the components of the complex signal recursively under control of a Kalman filter that enforces a constraint to recover data.

1459828329-1ab7192b-40df-495b-a44a-57dd2dff897a

A medical device known as an implantable neurostimulation system is configured for implanting in humans to deliver a therapeutic electrical stimulation to tissue to treat a variety of medical conditions such as pain, movement disorders, pelvic floor disorders, and many other conditions. The power control device is fastened to the upper surface of a transaxle by a screw via a mounting foot provided in the front-rear direction of the vehicle. The upstream receiver can be arranged in a recirculation loop with a steam separation drum, which may be bypassed during the initial heating of the upstream receiver by insolation. When a landmark is encountered and recognized, its true location coordinates are looked up from the database. At least apart of a peripheral edge of a ceramic layer defining the second through hole is visible through the first through hole. The panel sheet 100 corresponding to the language selected via the operation buttons 24a at the sections 111 to 113, 115 to 117 and 119 to 121.

1459828329-7c4c7b52-0306-40b9-9f3b-51724153437f

A method and system is presented for personalizing an electronic program guide that enables a viewer easily and quickly to access to the subset of information that is personally most relevant. A thematic hierarchy generation module receives multiple data sources and generates a thematic hierarchy of the data source, where a data source has one or more topics and a topic has one or more themes. The pool of constrained sequences may be generated utilizing a Knights Tour sequence generating system. At least one of the SCR circuits is configured to selectively provide a short or relatively conductive electrical path between the pad and one of the positive power supply terminal and the ground terminal. The process line reduces unnecessary processing steps by removing known defective individual liquid crystal panels before subsequent processing, with the knowledge about defects depending on stored information. The method for producing an internal olefin comprises a step of isomerizing an \u00b1-olefin having from 16 to 18 carbon atoms by passing through a zeolite catalyst bed, wherein the \u00b1-olefin having from 16 to 18 carbon atoms is circulated through and brought into contact with the zeolite catalyst bed before starting the isomerization reaction.

1459828329-8a05bb8b-7fb1-493c-826f-429db225000f

A method of manufacturing a semiconductor device package includes forming a patterned photoresist film with windows for exposing a plurality of connection bump areas on a conductive substrate, forming metal plating layers on the connection bumps area using the photoresist film, and forming first gold plating layers on the metal plating layers. The power system comprises a power module unit and at least one mounting rail detachably coupled to the power module unit. Then, the deflection

coil is removed from the winding machine and heat is applied to the deflection coil after the deflection coil has been removed from the winding machine to a temperature above a first temperature and below a second temperature. Flow channels are provided extending chordwise between the cooling fluid channel and the suction sidewall lip and include a metering section, an internal diffusion section and a breakout slot.

1459828329-c5c9cc37-4a12-4473-8d59-1e5b417bb01e

Provided are a method and apparatus for decoding a mixed code that is a combination of first and second code images. A metal wiring layer is formed on a semiconductor substrate including a circuit region, and first conductive layers are formed on the metal layer separated by a pixel isolation layer. The base of the first chamber is provided with electric heater and a thermally responsive control is provided associated with the base so as to be responsive to the temperature of the heater or to a section of the base for interrupting the power supply to or reducing the heating output of the heater.

1459828329-c76a3a8b-2be1-401d-b710-2c911b9fa5e7

Embodiments of methods, apparatuses, devices and/or systems for manipulating hierarchical sets of data are disclosed. In one implementation, multiple request generators, grant arbiters, and acceptance arbiters work in conjunction to determine the scheduling of packets. The reference image is generated by identifying a defect or contaminant of the mask in the subject image and modifying the subject image to remove the defect or contaminant from the mask to generate the reference image. The tape can be wrapped around one or more conductors, such as wires that transmit data, to provide electrical or electromagnetic shielding for the conductors. A preferred embodiment uses a hydrogen source to minimize the halogen content of silicon nitride materials deposited by PECVD.

1459828330-036f777e-732f-4adb-9d4d-0553dbcaf248

A turbine rotor blade with a four-pass aft flowing serpentine flow cooling circuit with a first leg located along the leading edge and the fourth leg located along the trailing edge region, and with two exit slots connected to the fourth leg with one exit slot opening on the trailing edge just above the platform and the second exit slot opening just below the platform. The closure includes a stopper, a shield, and a pusher. SO<sub>x</sub> released from the SO<sub>x</sub> trap catalyst in this region can be trapped in the SO<sub>x</sub> trap catalyst at the downstream side once again without flowing out from the downstream end of the SO<sub>x</sub> trap catalyst. To reduce the amount of feedback information, transmit beamforming combines limited feedback and beamformer interpolation.

1459828330-46053a65-fce5-4dd0-a076-a96a9352f7ac

Methods and apparatus for communicating between surface equipment and downhole equipment. The server may be operable to receive a dual channel communication packet from the client. A method of deploying an apparatus using such a composition may include placing the apparatus at a suitable location in a wellbore and activating the composition to deploy the apparatus in the wellbore.

1459828330-4c645f35-0639-42d0-b11b-4486c81a2142

The present invention enables secure, valid card payments in credit transactions to be performed, preventing fraudulent card use even in cases of loss or theft of a card or of information theft. The method also includes calculating future subframes expected to experience coexistence issues based on previous subframes estimated to have experienced coexistence issues. In preferred forms, a series of alternating interdigitated trapezoidal starboard and port headliner modules are disposed adjacent to the cabin headliner. A programming circuit programs all of the plurality of banks except a last of said banks with page data. Subsequently, the primary printer receives raster bits corresponding to the un-rasterized portion from the secondary printer. Also including, fluorescent layers, wherein a light

absorption layer is formed on a side of each bus electrode directing the inside of the cell.

1459828330-b3d1a4e8-40a9-4d03-b682-9fcb83770241

An encoding/recording device encodes a video signal according to MPEG, encodes an audio signal with a predetermined method, and multiplexes the encoded video signal and the audio signal to produce a system stream. First, a radio frequency module of the GPS receiver is used to receive a satellite signal from at least one satellite. The method includes determining whether the sequence started, determining whether the sequence completed, and determining whether a sequence fault occurred.

1459828330-e74de662-1a71-4393-bd87-7bb1bf4bfe11

The invention relates to a process for determining pressing parameters for the pressing of compacts, whereby in one step a test compact is brought to the required density in order to achieve the nominal pressing force, and in order that consequently the machine is in a balanced deflected condition with regard to this nominal pressing force. A steering shaft is divided into two portions in the axial direction. The header structure further includes one or more electrical leads extending through the base portion and into one of the first and second portions of the header structure.

1459828331-1ad78813-9cb1-41fa-9db5-ecce758278e8

A method is provided for limiting noise in a plurality of signals received in a multiple input receiver. The receiving unit receives two pieces of image data to be compared with each other. The insulation porcelain has a groove formed on an outer peripheral wall thereof to define a portion of a reference gas passage communicating between an air inlet formed in the metallic cover and the reference gas chamber.

1459828331-3da26259-306d-489e-ba38-d20b6dd7d804

Embodiments of the invention describe a modulator material heterogeneous-bonded over a resonator structure in a photonic integrated circuit to create a resonance-enhanced modulator. Said software includes an upgrade program that is extracted from the software and placed into a user software protection device, and a protected program retained after the upgrade program is extracted from the software. The structure comprises a composite beam elongated in the direction of the printhead and being at least as long as the printhead. The first collimator is rotated about its central longitudinal axis to adjust a position of the first optical output beam on a surface that intercepts the first optical output beam. In another embodiment, each device comprises a local embedded memory and is provided with a DMA for transferring data between the local memory and the shared memory. This technique also includes determining power applied to the electrical loads, and dynamically controlling the amount of power supplied from the power generating device and an electrical energy storage device in response to the power applied to the loads.

1459828331-810ddbc7-f0c7-406a-a4d8-56185ea771d8

A hybrid gateway includes functionality that allows bandwidth on a network to be dynamically allocated and enforced. In use of this recording material, printed items in a desired size can be formed rapidly and easily. The route distance icon can provide the on-the-route distance.

1459828331-f4b2a9de-eded-46db-878f-a659ae5f579d

A method for separating features in a target layout into different mask layouts for use in a photolithographic process. The invention also relates to pharmaceutical compositions comprising said derivatives, as well as to the use of these spiro2H-1-benzopyran-2,4-piperidine derivatives in therapy, more specifically for the treatment of CNS disorders. A void is formed in a first surface of the fabrication substrate and a first active region of the photodiode having a first conductivity

type is formed in the void.

1459828332-2b0b5b54-6588-4aca-8ab7-95c386cca31a

An apparatus that enables quick disconnect termination or connection for cryogenic transfer lines is presented. The thin film transistor is formed on an insulating substrate. The common computing module includes a control processor, a plurality of processing units, a plurality of local memories from which the processing units process programs, a direct memory access controller and a shared main memory. A method for attenuating the noise that is produced by the exhaust flow of a jet engine is also provided. The system also comprises a reading device connected to said syringe for displaying flow, pressure and flow resistance parameters. Only the diamond film in the vicinity of the cutting edge can be polished first, without polishing the film of the diamond formed centrally of the rake surface and/or the flank surface.

1459828332-557b569a-4225-4e0e-96a0-1e503f2c7210

The present application provides a subscription interface positioned between client devices and third-party digital subscription providers. Calibrate coarsely a frequency of an oscillator according to a width of an end-of-packet of the series of digital data. The receiver receives first and second location information requests comprising respective first and second timing periods at first and second reference times respectively. The first passageway is in fluid communication with the front chamber and second lumen. According to the approaches described herein, adequate cold-start fuel atomization may be provided without compromising driver satisfaction due to excessive pre-ignition delay, while at the same time reducing unnecessary heating of fuel during warm engine off conditions. The torso raising assembly is movable between a lowered position and a raised position.

1459828332-93937faa-4ea4-4adb-b5eb-affc3a0a7db5

A garage door bottom seal retainer comprises a seal cavity, an exterior tension member, and an interior tension member. The technique is suitable in particular for what is referred to as software-defined telecommunications equipment. The float is fitted on a shaft of the fluid level sensor.

1459828332-aba93f37-4bc3-42cb-a2b9-5c29f0e5d1b8

An aerated frozen product comprising less than 8% fat by weight and characterized in that the aerated frozen product comprises fat platelets, and after it has been melted and cooled, comprises fat platelets and spherical fat globules at a platelet to sphere ratio of greater than 0. A greater number of address lines than a minimal number of address lines needed for unique addressing in a deterministic, non-randomly fabricated multiplexer or demultiplexer are used. These any two different images are from among an externally input image, a live image, and a document/multimedia image.

1459828333-1a3c421f-dbe7-4af3-923f-43ad85033538

A method and system for attaching LEDs to circuitry which would protect the LEDs from heat damage and allows for individual LEDs to be removed. The bulbous end is connected via a reduced diameter neck to the base. This set of roadway acoustic sound patterns is created by a physical contact between a roadway surface of the roadway and a tire on the terrestrial vehicle. The residual fraction of hot xylene reflux of the sliding material is in a range from 33 to 75% by weight based on the total weight of the sliding material, and the content of the silicone compound based on the total weight of the sliding material is in a range from 5 to 35% by weight.

1459828333-918b175e-7ed5-4548-a29c-0de23176e579

Methods and apparatus for robotic induction in materials handling facilities with batch singulation inventory areas are disclosed. The cup seal also includes an abutment surface and contact pressure adjustment surface. The game tokens comprise

a plurality of sets of game tokens whereby each of the sets of game tokens is designed for representing one of a plurality of players. One or more embodiments feature a network adapter for exchanging with a computer network information in the form of packets each including a packet header and packet data. This colorant can be prepared by treating an adsorption-treated Brassicaceae plant colorant extract by at least one method selected from among adsorption, ion exchange, acid treatment, and membrane separation to thereby give an aroma component concentration of 100 ppm or less in case where the color value  $E_{10\%1\text{ cm}}$  is 80. The compounds are useful for the treatment of chronic and acute pain.

1459828333-f7aa0858-19fb-44b1-93a1-43c7522ac094

In a method, data is partitioned into partitions, which are divided into levels. The identification may be performed without producing the first result or the second result. In progressing from an innermost layer to an outermost layer, there also exists at least one instance where subsequent positive angles of orientation are separated by or vary by about 15 degrees. Other embodiments are also disclosed. The aromatic hydrocarbon units have substituents of the general formula  $R_1SiR_2R_3R_4$ , wherein  $R_1$  is optional and is a hydrocarbon or ether linking the silicon and the aromatic hydrocarbon, and  $R_2$ ,  $R_3$ , and  $R_4$  are one or more of hydrogen, alkyl, and alkoxy, with the provision that no more than two may be hydrogen or alkyl. Inlet nozzles are connected to the inlet conduit.

1459828334-2540a768-7774-4874-9927-232448084454

An endoscope apparatus for endoscopic treatment is disclosed. The plasma device includes devices with a plasma that is responsive to electromagnetic radiation and/or electrical signals. Each tension element includes a mechanical fuse operative to fail in tension when the first and second side elements supply an excessive tensile load to the tension element. Based on the selected output mode, an image path among a plurality of image processing elements of the apparatus is selected among a plurality of image paths. The exterior anchor may be positioned on an exterior surface of the first sidewall.

1459828334-575a644f-f722-4988-beea-77cbd27b9476

The present disclosure relates to the use of DNA sample data as part of a biometric security system in a transponder transaction. An interlayer insulating layer and an auxiliary layer having interconnection line patterns are sequentially formed on a substrate in which a conductive region is formed. The second predetermined portion of the media content is different from the first predetermined portion of the media content, and the second data-based compression algorithm is different from the first data-based compression algorithm. A first focal lens is arranged to receive the optically interacted radiation and the one or more stray signals and generate a primary focal point from the optically interacted radiation.

1459828334-9d3d9a25-9f60-4632-89b7-8aa147eaaba8

The objectives of the present invention are to reduce the throughput required for a rapid reproduction or other special types of reproduction and to improve also the data access speed at the time of a rapid reproduction. The invention also relates to the use of the compounds of the formula or pharmaceutically acceptable salts thereof for preparing a pharmaceutical composition for the treatment of a medical disorder susceptible to treatment with dopamine receptor ligand, such as schizophrenia. The parity for all of the diagonal parity sets except one is stored on the diagonal parity disk. Communicating in the first node with a third node using messages associated with a third set of operations, the third set of operations providing at least part of the operations provided by the first and second set of operations. Each of the thermal inkjet printheads includes a heater that heats ink by directly contacting the ink and is formed of an alloy of  $Pt_{20}Ru_{14}$  or an alloy of  $Pt_{20}Ir_{14}X$ , where X is at least a material selected from the group consisting of Ta, W, Cr, Al, and O.

1459828334-aa8e8fa1-0b4c-4a46-8ae9-e437957aa188

An electrical interconnect providing an interconnect between contacts on an IC device and contact pads on a printed circuit board. A primary storage control device and first secondary storage control device are connected by a synchronous method, and the primary storage control device and a second secondary storage control device are connected by an asynchronous method. The connection piece preferably has a hollow cylindrical shape and includes a securing mechanism, especially a thread, at one end.

1459828335-109a0845-567f-4717-8783-257c9dd01962

An ink composition comprising: a coloring agent having an oxidation potential of more electropositive than 1. This ensures that data encrypted either with the first encryption parameter or with the second encryption parameter are always shifted, thus making it harder for attackers to eavesdrop on clear text data. These strategies suffer from a number of performance problems including slow execution, large software and execution overheads and deadlocking problems. As a result, if a space between an electron drawing electrode and the electrode for the electron source is narrow, the percentage of anode current increases in the total current, thereby improving the current distribution percentage. In some examples, the method enables an element to be added to the queue even when the queue is in a locked state. An operating cooling efficiency indicator is calculated as a ratio between equipment electrical power consumption and a temperature differential between the equipment and an ambient temperature.

1459828335-402097d8-99d9-4edf-8068-86ecb1aab5b7

A latching mechanism capable of providing clamped retention to a vertical member, and a repositionable part support device and part support assembly employing said latching mechanism. In this embodiment, at least a portion of the conductive layer may be used as a reference voltage plane. In one expression, the magnetorheological-piston core includes at least two separate core pieces, wherein each of the core pieces is a powder-metal core piece, and wherein the coil is positioned to circumferentially surround at least a portion of at least one of the core pieces. The supply system further includes first and second fuel tanks fluidly connected to the first and second outlet ports of the manifolded Y-connector. Penetration depth is optimized by limiting range of distances between paths and detection fibers.

1459828335-758aa456-a111-4542-bc8b-4ead70207ee9

Embodiments of our invention describe the method for producing forbidden pattern free codewords using an encoder-decoder. Because the quench cools the sheet, conventional cooling lines are eliminated from the mold. When the graphics panel is in the upper position, the wares on the bottom shelf are viewable to potential purchasers and when the graphics panel is in the lower position, the wares on the upper shelf are viewable to potential purchasers.

1459828335-78e38822-879b-41fb-8ff7-6ed645c47ea8

A drink making machine includes an ice shaving and dispensing unit which provides a predetermined amount of ice, by weight, through a chute to the pitcher of a blending unit. Other embodiments may be described and claimed. A passive element circuit including an inductance element is connected to an input stage, that is, the stator side, of the rotary transformer in parallel to the rotary transformer.

1459828336-14d11c88-eecc-445f-9239-63f4b76c855d

Systems and methods of monitoring packet delivery are disclosed. In particular, the present invention provides a multifocal contact lens, a multifocal intraocular lens, a method for making a multifocal ophthalmic lens, and a method of correcting presbyopia by reshaping the cornea of an eye. This maximizes the torque developed and transferred to the hubshaft in a manner that does not greatly inhibit total through flow. A section of the flexible member is left as a tail.

1459828336-2239c7be-a12c-4dde-ab03-bf962ef07e26

An active air flap apparatus for a vehicle is configured to include an air flap 20, a thermoelectric device 40, a PCB 50, a heat transfer bar 60, and a variable length member 70. A group of transmission channels to be used for each data stream is initially identified. An ECU determines a purifying performance of the catalytic converter based on one of an amount of supplied NOx deoxidizing agent, which is required to deoxidize and remove absorbed NOx at the NOx catalytic converter, and a parameter that correlates with the amount of the supplied NOx deoxidizing agent. The probe is applied as a layer to a surface, exposed to fluorescence-inducing energy, and emitted fluorescence measured.

1459828336-7e2beb0e-49a1-456a-acf6-9bdca9430674

An Interferometric Modulator is a microelectromechanical device for modulating light using interference. The first connector portion may include a first base, a male contact carried by the first base and extending outwardly therefrom, and a first shell carried by the first base and surrounding the male contact. The method is suitable for the electropolishing of metal surfaces after formation of filled vias for through-silicon via processes employing metals such as copper, tungsten, aluminum, or alloys thereof. After the completion of the data transfer, the hard disk with the failed head and the other hard disk serving as the destination of the data transfer are used as hard disks constituting the same RAID array. The control system may also take into account whether a user has selected the electric-only power mode.

1459828336-d9812258-01dc-4560-84d2-e3d761b579c3

A method and apparatus for programming nonvolatile memory in a microcontroller. The camper has a solar structure carried by a base. The method can further includes executing an algorithm that reads each of the configuration status values that were stored responsive to executing the plurality of rules and processes the configuration status values so as to produce a final configuration status of the computer and storing a record indicating the final configuration status of the computer.

1459828337-2e6b37fc-e4f2-4de7-85b9-bb47fd4d6a99

A gyricon display containing modified particles is disclosed. The stator is composed of at least three structural elements to be installed around the rotor provided with at least one flow regulator. Each expansion slot has an opening for mounting an information-accessing device. Each buckle unit includes at least a base, and a second connecting portion for engaging to or disengaging from the first connecting portion. An embodiment of the solution proposed here extends the \u201cConnecting without cables\u201d concept of Bluetooth to firmware upgrades.

1459828337-67924649-d2cd-41f7-bc06-77818cb2cdc8

An airfoil for a gas turbine includes a pressure sidewall and a suction sidewall, a tip cap, and a tip squealer. This tool not only improves the accuracy of testing, but also nearly eliminates the need for mobility engineers to spend time and money traveling to customer sites. The handle has a latching member to couple with the receiving member.

1459828337-6d940769-0ace-4de7-b022-39b52bd5fca5

A graphical user interface displays a shape. Linear and or angular movement of the print head as it encounters label edges is detected by sensors coupled to the printer frame. The impingement cooling channels may be adapted to match heat localized loads and hot side gas pressures across the turbine blade to maximize the efficiency of the cooling system. A low pass filter is connected to the forward coupled port. The windows of the template have stored image attribute requirements associated therewith that are designed by the artist are correlated to match image attributes of at least one user selected image. The mirror may be formed by

polishing an edge of the die at a 45 degree angle and coating the polished edge with a metal layer.

1459828337-89fb129a-8cdc-44a3-ae26-81c84eef91d7

A physically stable, concentrated isotropic liquid detergent composition comprises from 10 to 70% of an anionic, nonionic, cationic, zwitterionic active detergent material or mixtures thereof, from 0. More particularly, the indicia on the keypad appear to float above or below the surface of the device. The device includes elements for measuring the output effect of the charger, elements for measuring the output voltage of the charger, elements for dividing the signals measured and elements for multiplexing voltagecurrent of the output from the elements for dividing, wherein the multiplexed voltagecurrent is used for modulating the input DC power in order to reduce the output current. A system for removal of CO<sub>2</sub> from a flue gas.

1459828338-17582cfe-7808-46b8-922e-b30a00e04948

An improved turbine engine topology, wherein the improvement comprises a repositioning, with respect to a conventional intercooled regenerative turbine engine topology, of exhaust gas output from a low pressure turbine stage to a regenerator, to an exhaust gas output from a high pressure turbine stage to the regenerator. To form a housing, the leadframe is sheathed, preferably, with a molding compound, with the thermal connecting part being embedded such that it can be thermally connected from the outside. The second dielectric layer includes a higher refractive index relative to the first dielectric layer, such that the first and the second dielectric layer create an optical waveguide.

1459828338-54683787-376c-4fdb-bf3e-045bcf0b3fd0

An apparatus for collecting blood clots, plaque, and other debris in arteries or veins, said apparatus comprising: a filter assembly having a chamber with a paddle assembly and a porous floor disposed therein; and tubes for coupling said filter assembly to an artery and to a vein. The disk chucking apparatus may include: a chuck base having a plurality of holding portions, a plurality of chuck pins which are inserted in the holding portions such that the chuck pins protrude out from the chuck base, and a plurality of elastic members which elastically support the chuck pins, where each of the elastic members elastically supports a pair of adjacent chuck pins concurrently. Plants transformed with such a construct are characterized as having a protein, fragment thereof, or peptide of interest on the surface of a floral cell. The tool can be repositioned within the horizontal leg by withdrawing the primary wireline, removing or upper string tubing sections, and then reinstalling the primary wireline. A state machine compares the values of two keys, one stored within the block, to another value stored in the state machine controller, and allows the block to be used in production if the key values coincide. The socket contact is held in a contact chamber by a latching hook.

1459828338-ba130565-ad41-4a56-bff8-14c359e30e77

A transistor and a method for fabricating the same that involves a forming a device isolation oxide film semiconductor substrate, forming an opening in the device isolation oxide to open the substrate and define an active region, the junction between the oxide and the substrate having a rounded profile, and then forming a complex gate electrode structure in the active region. The method includes determining a radio bearer state of the UE, and switching a current operating frequency of the UE to a preferred frequency corresponding to an MBMS service prioritized by upper layers when the radio bearer state of the UE is in signaling transmission state. In accordance with the present invention, it is possible to provide a high-quality microphone unit whose outer shape is small and which is capable of performing thorough noise cancellation. The first capacitance has one end that communicates with the input of the first amplifier. A system-level output response of the simulated network to a simulated input signal is analyzed, and the printed wiring board is characterized based on a comparison of the system-level

output response to a printed wiring board performance metric threshold.

1459828338-caeac1a6-3dbe-40e3-be37-cf0cddbcd8d8

A system and method for improving the interoperability of communication system components using multiple audio encoding formats within a single talkgroup is provided. Crude oil and wash water are mixed by a pressure drop across a mix valve, thereby forming a crude oilwater phase stream. The first array of pixels in the sensor receives impinging light and generates optical energy values therefrom. The cascaded filter has a new third set of filter parameters that are a function of both the first material and the second material. The pipe system is provided between the cabinet body and the refrigeration-cycle unit, and includes a cold accumulation chamber pipeline communicating the refrigeration-cycle unit with the cold accumulation chamber and a refrigerated cabinet pipeline communicating the refrigeration-cycle unit with the refrigerated cabinet. The connecting rod has a piston end, a crankshaft end, and an interconnecting shank.

1459828339-5ffbfbe1-d4fa-4e18-a924-c085e2014c4a

A system and method for identifying objects using a machine-vision based system are disclosed. In particular, a parameter selection process is provided for automatically computing the decomposition parameters WS and WB to create soft tissue and bone images, respectively. The method can further include directing a change in a displayed characteristic of the icon when the overall operational state of the aircraft engine changes from the one of the started state and the unstarted state to the other of the started state and the unstarted state.

1459828339-6a72488e-9453-484e-8a7f-5372dfe3265f

Disclosed is a method for determining database queries to be sent by an analytical server to a Relational Database Monitoring System by using hierarchical level metadata to describe the various structures within the database. The semiconductor storage apparatus controls a timing at which data is programmed to a block based on at least one of the recent programming time and the recent erase time of this block, and/or controls a timing at which an erase process is carried out with respect to a block based on the recent programming time of this block. The upper stage and the payload structure together define a central axis that is generally coincident with the thrust axis during launch. In addition methods for the preparation of halophthalic anhydride, and recovery of high purity acetic acid from an aqueous acetic acid stream comprising HCl, which is generated during the preparation of the halophthalic acid are also disclosed.

1459828339-ed08ce31-2650-4bc2-a28c-72b083f6e674

A predictive failure model is used to generate a failure prediction associated with a node. In one example embodiment, an electronic magazine may be presented to a user device as a widget without using a browser. Each floating unit comprises a floating pontoon, a stabilizer unit and connecting means for the interconnection of the floating units. The first curved sidewall portion has a length L1 as viewed in horizontal cross-section that is less than a length L2 of the second curved sidewall portion.

1459828340-2ac7cae5-f4d0-4fc8-b212-d1e9bf7f1c0b

A semiconductor integrated circuit for driving an LCD. The housing has apertures aligned with the holes in the lighting module and the perforations in the ear-like extensions of the gasket, as well as a window to expose the light emitting region of the lighting module, with a light permeable screen which sealingly closes said window. The interface receives a read command.

1459828340-d8f2d72d-6bf5-44fe-b0d4-b13dadb040d0

An electrosurgical instrument having a movement sensing device for controlling the electrosurgical output thereof, is disclosed. The shield comprises a plurality of overlapping planar glass flakes which are held in a lamellar matrix of flexible

polymeric material. The power supply voltage detection circuit has elements analogous to the elements in the constant-current circuit that determine this voltage, so start-up operation can occur and end reliably. Broadband operation may be enhanced by at least partially enclosing the sufficiently thin transducer element within an aperture and/or a cap. If the probability of the window containing a right face and a left face are both greater than threshold values, then it is determined that the window contains a full face.

1459828340-fa7d63cb-60f2-4670-abc1-d6b9e9add30a

Apparatus and systems are provided for thermal regulation of a memory integrated circuit. Methods and apparatuses are disclosed that provide thin and fully relaxed SiGe layers. Left and right support panels are pivotally attached, by means of support hinge knuckles, to seat hinge knuckles on the seat left and right ends, respectively. A current operating program for the processor is stored in a non-volatile form in the read only memory. vehicle velocity suitable, determined under steady state front steering angle and velocity conditions, to maximize the contribution of the rear wheels while avoiding side-slip of the vehicle. The geometry engine crops a field image from each frame image based on the size and position of the field bounding box.

1459828341-5f2e8cef-21b3-46f5-a0d4-79daeb0b7a89

A hydraulic system for use in a work vehicle with a powered implement is disclosed. The composition preferably comprises a base consisting of paraffin and, optionally, paraffin and petrolatum having electrically-conductive particles suspended therein, which preferably include graphite diamond, or elemental metals such as silver. In response to the indication, a software application resident on said electronic system is automatically notified of the insertion state.

1459828341-600b43fb-74a0-4d49-8d82-6b5358c62c02

A system that provides information about media content stored in a storage device coupled to an interactive media services client device. The method includes: detecting a limited automatic repeat request header in a frame with a priority tag; stripping the LARQ header and a frame check sequence in the frame with the priority tag; recalculating the FCS for the stripped frame with the priority tag; and adding the recalculated FCS to the stripped frame with the priority tag. Thus, it is possible to carry out the measurement of the concentration of annexin-V in the urine, and it is possible to carry out the diagnosis of an internal organ disorder such as a disseminated intravascular coagulation syndrome, the diagnosis of acute nephritis and the like by a analyzed value of concentration of annexin-V measured in the urine.

1459828341-6c8c3c41-ed3b-4076-8c9f-409fe51a4ea2

The present invention describes the cloning and molecular and cellular characterization of a novel protein with homology to the IL-17 receptor. The dielectric body defines an array of plated through-holes that are constructed to receive a terminal of an electrical adaptor. The terminal parts 19 of the adjacent bus bars 13 are provided with first rotation restricting parts 48 which are adapted to be contacted with both side faces of the semiconductor light emitting element 25 which is disposed between the two bus bars.

1459828341-a7238e06-0300-4367-a493-f75d2e2f1623

A Random Early Detection policer in accordance with the invention does not tail-drop arriving packets as being non-conforming. The arm is activated by rotational movement of the lid relative to the bowl, as an extension member attached to the lid, which is activated by insertion of the plunger, extends downwardly from the lid and engages the ramp surface of the pivoting arm when the lid is rotated. The microprocessor is adapted to determine the monetary value of coins in each of the plurality of stacks of coins. The ticketing services bureau then generates an output data file based on the original ticket order, the edited on-screen ticket

proof and print characteristics of the printer that will execute the ticket order. With this device there is at least one fuse panel that is in electrical communication with a main distributor. A substantially rectangular implosion-proof band made of metal is banded on the outer surface of the skirt portion.

1459828341-c7cd4e0e-6d5d-4b8c-810c-74abf69ae60d

A system is provided for mobile device file management. The F-number determining member can be positioned between a vertex of an object-side lens surface of a lens that is nearest to an object side in the third lens unit and an intersecting point of the object-side lens surface and a peripheral portion of the lens in a direction of an optical axis. Such a paper conveyance control apparatus, being electrically connected to the video controller, has a memory to be shared with the video controller. The incorporation of the zirconium containing aggregate improves the fire resistant performance of the laminates.

1459828342-0c4f24ea-65b1-4459-8987-cb828c8898f2

A portable RAM drive comprising data stored on a non-volatile memory and transferable to a volatile memory when the portable RAM drive is coupled to a computer system. In a most general embodiment, the inventive circuit is adapted for use with a component having a parasitic resistance  $R_3$  and a first resistance  $R_1$  disposed in series with the component and an arrangement for making the resistance a negative resistance. The vehicle has a seat occupancy sensor and a door switch. The apparatus also includes a releasing member for releasing the connections between the push rods and the harness upon actuation of the releasing member by a user. The invention provides for longer catalyst cycle life when processing aromatics under commercial transalkylation conditions. The accounting system includes a computer-assisted process that nets subscription and redemption orders that occurred over a particular time and records a transfer of securities into or out of the fund based on the net of the subscription and redemption orders.

1459828342-6d9a4275-a7bd-4c48-b51e-5d41d0845c8e

An alphanumeric information entry process that includes provision and use of a personal context model that correlates various examples of user context against a unique personal language model for the user. The connecting member is operable to connect to a syringe barrel and a needle. Sub-projection matrixes are arranged widthwise and lengthwise to generate one sub-measurement matrix. Thereafter, messages such as email messages that contain the schedule are generated and sent to corresponding device owners using the IT migration tool. The second polarity terminals of the first and second secondary batteries are connected to each other by a first conductive body. The first and second bottom VCM plate hold-down clamps are configured to prevent damage to the pivot bearing assembly during installation of the top VCM plate over the bottom VCM plate by clamping down on the bottom VCM plate with a force that is at least sufficient to prevent the bottom VCM plate from moving when the top VCM plate is installed over the bottom VCM plate.

1459828342-76fdee17-88ce-4bf7-b218-8fb8e235a0a6

In at least one implementation, a vehicle wiper control system includes an actuator and a controller. The superconducting magnet is connected in parallel with a series combination of a superconducting fault current limiter and a resistor, and with a DC power source. A tally of preferred contestants among all voters is assembled as is a tally among contestants from the subpool, and contestants may be ranked. The lip and the channel have side portions that engage at multiple contact points to form an environmental seal that prevents contaminants, such as wind-driven dust, sand and moisture, from entering the interior cavity when the outer cover is in the closed position, thereby protecting communications equipment within the NID without the use of an elastomeric gel, seal or gasket.

1459828342-81c35ed4-02dc-47a3-abc0-563bc58b174a

The present invention is directed to methods and apparatus for sealing a puncture

or incision formed percutaneously in tissue separating two internal portions of the body of a living being with an anchor, a sealing plug and a filament connecting the anchor and sealing plug. For each predictor, the item is assigned to one of the groups. The lamps have an acoustic resonant frequency range and the output frequency range of the control is arranged to be above the acoustic resonant frequency range. An inventive structure resulting from the method is also described.

1459828343-0da53b33-04aa-4642-9dcf-7f4eaf63b6bf

Polishing slurry for texturing the surface of a magnetic hard disk substrate has abrading particles with diameters in the range of 1-10 nm dispersed in a dispersant such as water and a water-based aqueous solution. The initiator is preferably 4-phenyl)-propionic acid N-hydroxysuccinimide ester or 2-bromo, 2-methyl-propionic acid N-hydroxysuccinimide ester. The outer shield shell includes a second shell body in a tubular shape, and a fixing portion which fixes the inner shield shell. More specifically, the lower operating speeds may lead to less fuel consumption. Also disclosed is method of using the mechanism which comprises the steps of positioning the rail within the channel and adjusting the clamp to compressibly engage the interior surface of the channel against the exterior surface of the rail until the rail is secured against the interior surface to prevent movement of the rail within the channel.

1459828343-23c9b734-bf95-447b-b692-b419e851eec4

A chitosan composition which forms a hydrogel at near physiological pH and 37°C. The device further comprises a reach-through structure connecting the first and second sub-collectors and an N-well formed in a portion of the second epitaxial layer and in contact with the second sub-collector and the reach-through structure. 1, and in each duration of the pulses, a clock signal for 64 tone levels is given. After pressing, the component is sintered to form the porous filter. This serves to prevent passengers and crew members from disabling the system. These reflectors may be configured to reflect the corresponding principal rays along a second set of chords.

1459828343-298c9e5b-063a-441f-8ca6-364d8b8aa445

The semiconductor device according to one of the embodiments of the present invention includes a metal block having first and second main surfaces and defining a recess on the first main surface. The clamping arrangement comprises a bolt in-molded in a generally central part of the inner door and or external nut. The pool cleaner additionally incorporates modular components including a simplified mast unit and related water distribution manifold for delivery of water under pressure to a water turbine drive unit for rotatably driving cleaner wheels to travel over submerged pool surfaces, with a portion of the pressurized water inducing a vacuum action for collecting debris within a porous filter bag. Each layer of the graphic file contains a control object to an element of the user interface. An arrangement of the photo-conversion elements is independent of the X-ray paths.

1459828343-64ae4682-bc56-43c3-acec-bcccd6284f81

A safety can for storing flammable liquid is disclosed. The method provided by the present invention is capable of improving performance of semiconductor devices and alleviating manufacturing difficulty at the mean time. A corrective filter is then applied to enhance the primary reflection signal content of the data and to eliminate unwanted noise events. A signal generator generates a series of positive electrical pulses to be applied to the living body through the applicators.

1459828344-3361d946-86de-432d-93bb-b3aed58a338e

Golf ball pick up devices are disclosed which are simple in design and construction while permitting exceptional performance during usage. The selector selects each member constituting a learning data set from a data set source. A given object may be stored once, even if it has a recurrent time property. Thus, this connection

system preserves the advantages of a standard laser-fiber connection system while increasing the safety of such systems, where it is necessary. The system further includes a data processor that is operable to price and match a contract from the contract data and the registering data.

1459828344-428f7639-e425-4ed1-8347-f9d9b93f6e5b

Described herein are compositions and methods for prognosis and treatment of prostate cancer patients. The rhenium nanoparticle mixture can be painted onto a surface to be coated and dried at low temperatures to form a gas-tight elemental rhenium coating. The control unit adjusts a quantity of the reagent to be metered into the exhaust stream.

1459828344-78dc1787-21c8-4321-b1e0-4dc745554377

A splint includes a first substantially flexible member having an inner surface and an outer surface. In an illustrative embodiment, a call processing system coupled to a telecommunications network receives a call from a caller intended for a first party, wherein the call is associated with call signaling information. The combined administration of a superantigen and a chemotherapeutic agent provides enhanced therapeutic effects in a treated animal. The acoustic transmitter and receiver are moved at the same rate at which the drill axially progress through the workpiece, so that they are aligned with the bottom of the bore. An inversely diffused signal using a correct orthogonal code is selected and demodulated to obtain a first receiving data row.

1459828345-df3d2aa1-f545-4018-9e63-baccf5de4724

An interactive greeting card having a multi-panel greeting card body, a sound module and a molded track contained between two or more panels of the multi-panel greeting card body, and a moveable object which is attached to the molded track through an opening in one or more of the greeting card panels. A first core has a first instruction set. Particles of the abrasive are thereby efficiently recovered from a waste fluid discharged from a CMP process in semiconductor manufacturing factories and are reused. , and a turnover temperature of the frequency-temperature characteristic curve in the second detection mode is  $T_c$  C.

1459828346-134c8bbb-1f23-422a-9b05-5343ac39eda4

A method for removing polymer as an etching residue is described. A water activatable adhesive that, when activated, can adhere to a wearer's skin is also deposited on at least part of the absorbent article is also described. The light reflected by the second mirror is reflected by a third mirror in a direction opposite to a direction in which the light is reflected by the quick return mirror, and is further reflected by a fourth mirror toward an eyepiece located on a back side of the body unit.

1459828346-1e91a95a-6cfa-4582-94d4-2c061d1ac8ad

A method of operating a drive train for a hybrid electric vehicle, and a drive train, is disclosed. Since foveal fields of view are very narrow of the order of one degree and little information is transmitted to the computer outside this range there is almost no cross-talk between foveae. A base station may monitor the location of a mobile device in proximity of the user. The content can be transferred to the recipient if the recipient memory device has the specified properties.

1459828346-2667448c-a5fb-465d-8210-1f724d5c8845

An approach is provided for bit labeling of a signal constellation. Some embodiments provide methods for use in encoding content. The system includes a billing accumulator and a settlement entity. The socket is adapted to receive the plurality of pins. As such, the expanded color space may compensate for one or more color shifts in the image data caused by the ambient light. The aggregate flow block further includes statistics for the selected network tunnel.

1459828347-32df8520-5106-4092-8743-671f079db68a

Techniques for selecting rates for data transmission on eigenmodes of a MIMO channel are described. The via may have a depth of at least about 50 \u03bcm from a top surface of the nitride layer and an opening of less than about 10 \u03bcm at the top surface of the nitride layer. User criteria can be provided to limit the selection of candidate volumes for mirroring.

1459828348-0d126658-7aeb-4417-96df-c53c4b29e3ba

A workflow server system is provided which uses an XML namespace designed to execute various workflow server services. The solar power supply arrangement includes a solar collecting device supported by the main supporting stem, wherein the solar collecting device has a collecting surface arranged to expose to sunlight for extensively collecting solar energy. The phase-locked loop circuit adjusts rapidly the frequency and the phase of the output signal of the voltage controlled oscillator to correspond to that of the reference clock signal. The bag encloses the space saver pillow and an amount of air. The operator interface is located at the rear of the unit and faces in an opposing direction from a main player display so as to be viewable by an operator located at a rear of the unit.

1459828348-2ac91f7c-0a50-4ea6-b4af-be79b35a662a

A method of selecting and presenting content based on inferred user preferences is provided. In various embodiments, an implant for interfacing with a bone structure includes a web structure, including a space truss, configured to interface with human bone tissue. The method includes determining a first error estimate based on decoded symbols corresponding to the coded symbols, determining a second error estimate based on the uncoded symbols, adaptively selecting the first error estimate or the second error estimate based on a convergence criterion, and determining a step size based on the selected error estimate. Such a turbomachine: a radial turbine with an optional centrifugal compressor can be produced using two-microelectronic dimensional machining techniques of the microelectronic type. The transverse surface has at least one port comprising an annular flow passage, an intermediate flow passage and an outer flow passage extending outward from and in fluid communication with the inner surface of the internal valving chamber.

1459828348-98f4bd56-3b9a-44fe-9682-e69d64e22d48

A system receives a mask pattern and a first image of at least a portion of a photo-mask corresponding to the mask pattern. An interface area between the casing of the projectile and the fuze housing lower part is formed with a shape and/or strength modification which prevents the fuze housing lower part from being pushed into the casing on impact with a target that is to be penetrated. A primary side of the transformer 7 has a first capacitor 11, a circuit portion 13 including a rectifying element, and a switching element 14. To facilitate kernel-mode shimming and shim reuse, context information needs to be retrieved and maintained so that shims can identify particular driver calls and preserve driver specific linkage information.

1459828349-71aa6942-ef26-4bf1-8d37-4237862da468

Disclosed are a lighting method for a high-pressure discharge lamp, a lighting apparatus for a high-pressure discharge lamp, and a high-pressure discharge lamp apparatus each suppresses abnormal blackening of a discharge tube that may occur at an initial stage of operation from a discharge start. The firing circuit can generate, write and store one-time random session variables to the digital code plug. In one embodiment, at least one pacing electrode is constructed as, or incorporated onto, a stent at a distal end portion of a stent catheter. The decision engine accesses the content directory to determine the rules and attributes that govern the decision made by the decision engine.

1459828349-72ce83e7-36a0-4024-95da-4228581e3556

A thermosetting plastic composition comprising thermosetting plastic resin with comminuted recycled glass powder as a filler. The table member can be selectively positionable into a desired table plane and can comprise at least one ECG pad and/or at least one grid of electronic heating elements disposed onto a top surface of the table pad. A packaged resource adapter includes Java classes and interfaces that are required for the implementation of both connector contracts and functionality of the resource adapter; utility Java classes for the resource adapter; native libraries required by the resource adapter; and any help files and documentation and descriptive meta information that ties all of the above elements together. Formation of such a composition greatly enhances stability.

1459828349-a2b51961-9403-4600-a922-e1ef1c3c1567

A method for transmitting uplink data according to a dynamic resource request is disclosed. The cushion includes a rectangular bottom plate, two short side plates, a partition plate, a concave structure and a box structure. Subsequently, a third semiconductor layer is formed over the second semiconductor layer, and semiconductor-containing seeds are formed over the third semiconductor layer. A sealing elastic layer 452 of the gasket 45 is in close contact with the end surfaces 362 and 414, and a sealing elastic layer 453 is in close contact with the coupling surface 193. In the manufacturing method, a resolution of an optical system used to apply the energy beam is preferably 4  $\mu$ m or less.

1459828350-77ef042e-4271-4966-b249-876943e237b3

A mobile device operable with keys 14 having characters 16 engraved onto the surface of the keys. The push-button comprises a fastening sleeve portion having a press portion at a first end thereof and a fastening member at a second end thereof for connecting the push-button to a fastening hole in a fastening plate. A movement calculation block calculates a forward moving speed of the moving body and angular velocities thereof in both a pitch direction and a pan direction.

1459828350-91424825-4546-4ec0-8eda-4cf9a2f7ee3a

The present invention relates to imidazole derivatives of formula I wherein R1, R2, R3 and R4 are described hereinabove. The corrugated cardboard plate includes a plurality of corrugated cardboards laminated together and each formed by bonding liner sheets to surfaces of a corrugated sheet. A lock assembly is connected to the housing and is engageable with the tray when the tray is in the closed position. The method includes filtering, by the host gaming server, the messages for each of the account logins to create filtered messages.

1459828350-95d8b509-f285-4f25-9aa1-b04ac11edce0

The system includes a transmitter for generating a signal and a cyclic prefix, wherein the transmitter suppresses a plurality of sub-symbols of the signal to produce a partial response signal. Each of the non-oiled metal rollers includes a coating that is oleophobic that has low adhesion toward the solid ink image but sufficient lateral friction as to not slide against the ink or paper web. Essentially, the acoustical signal will be decomposed into the Intrinsic Mode Function Components. The at least two recesses selectively receive and retain one or more panel elements. The combined degassing and flotation tank is particularly suited for use in oil production at sea for removal of oil and gases from water streams before the water is returned to the sea.

1459828351-9cbb0523-053f-4496-bce7-71e9f5d5c3a2

An optical lens for adjusting viewing angle of and diffusing light emitted from a light emitting diode includes a light incident surface and a light emitting surface. The cloth body includes a cloth fiber layer, a heat insulation layer, and an electrothermal fiber layer. A control bail can have a pin extending therefrom that extends into the housing. The outer perimeter panels are each attached on one edge thereof to the center panel and interlock with each other during assembly to prevent accidental opening of the apparatus. The file plate comprises a base sheet,

a cushion sheet attached to one surface of the base sheet, and a file sheet attached to the cushion sheet, the file sheet practically functioning as a nail file. Network-based systems are also disclosed.

1459828351-b997bb14-dc43-43f6-a158-3db1407a4645

A wireless data processing device 2 stores partially completed versions of a file needed to replace a current version of a file used by that target device 2. The scroll key has two portions which lie on a line oblique to the horizontal. The introduction into the bore hole is carried out with a cyclically fluctuating pressure.

1459828351-c2ea4d91-b977-4dde-aaac-15e2ad8c3247

When a lower layer address pair of a transferred lower layer frame is counted a predetermined number of times or more, a packet transfer apparatus sends the lower layer address pair to a frame transfer apparatus. The first and second magnets cross a traveling direction of the ribbon-shaped ion beam. The cutting system includes a cutting blade, typically a rotary cutter, and a sacrificial plate or round bar contacting the cutting blade. The inner capsule contains a neutron source. The invention also relates to processes for preparing crystalline barium salt of -omeprazole and pharmaceutical compositions that include the crystalline barium salt of -omeprazole so prepared. The metal-stacked layer is removed to expose a lower surface opposite to an upper surface of the insulating material layer and a bottom surface of the patterned conductor layer.

1459828352-2349f196-2cd2-4864-8caa-24034cff24c2

A method for encoding computer-generated holograms in pixelated light modulators, the encoding area of which comprises a pixel matrix whose pixels are provided with a pixel form and a pixel transparency, wherein the encoding area contains a hologram made up of sub-holograms, to each of which is assigned an object point of the object to be reconstructed by the hologram. Each person has a skill set that is suitable for responding to a certain type of e-mails. The transport mechanism includes a motor which can be driven in one direction when picking an endmost sheet of print media from a stack of print media and driven in another direction when transporting the picked print media during printing. The first lenticular lens is disposed in front of the light source and respectively directs the light from the light source to travel in a plurality of directions. Particularly, an implantation process is performed twice to form two channel stop ion implantation regions in the course of forming the device isolation layer so that a cross-talk phenomenon between neighboring unit pixels is reduced and a leakage current is improved. A first switch is connected to the controller, and the first switch is for entering a setup mode and for selecting at least one of a plurality of setting configurations.

1459828352-34f34354-1744-4c42-9185-4d2238e4e1c9

A lightweight feed chain for a high speed nutcracking apparatus and which is composed of a plurality of individual nut transport elements mounted in succession. This can be achieved by allowing a first subscriber to use the credit or subscription of a second subscriber. The liposomes, being similar in composition to microbial membranes or cells, are readily incorporated into the existing biofilm. The image obtainer and the distance detector are arranged such that the reference axes are coaxially aligned. The best mode pump or pumps used is one or more vacuum pumps.

1459828352-74851710-dcc4-47be-9f90-7c7661151f9d

Generating error data associated with decoding data is disclosed, including: processing an input sequence of samples associated with data stored on media using a detector and a decoder during a global iteration; and generating one or more error values based at least in part on one or more decision bits output by the detector or the decoder and the input sequence of samples. An email message is sent from a sender to a recipient. The latch assembly comprises a base plate, a jaw

fixed at a first elevation, and a vertically displaceable jaw.

1459828353-42c54d6c-ccc6-4c7f-97c3-160a7669ac4c

A process for the preparation of an oligonucleotide is provided. A particular method is described of clamping a wafer, during the process that creates asymmetric stress in the wafer, to an electrostatic chuck having a concave portion in its clamping surface characterized in that the wafer is initially clamped around its periphery in a generally flat orientation and then is bowed into the concavity as the asymmetric stress is created in the wafer. A guide portion is provided by forming a down-grade slope inclined from a leading end of a shoulder opening side of the flange between the flange and the side wall.

1459828353-50baa30f-1a19-4423-978c-caf4d9f94ac3

A method and system for generating interrupts in an embedded disk controller is provided. A pair of opening and closing lever portions is disposed to face each other along the direction of a fore-to-aft or lateral axis, with intermediate portions which are pivotal about a fulcrum support shaft portion parallel to a left-right or longitudinal axis. The diagnostic device preferably can be locally attached to the fluidic device. The cover includes a third display connected to the CPU.

1459828353-a2e227b4-7189-44b8-b3df-b2825e038f6a

Disclosed is an interface device to couple a musical instrument to a computing device to allow a user to play a musical instrument in conjunction with a multimedia presentation. In an anode 3, a dielectric material 4 is applied on the surface of a discharging portion 3a in order to inhibit the deterioration of the electrode. With the present invention, a personal ad published in a newspaper includes graphical icons which denote if an ad has additional text or multimedia files available on the Internet. The body is substantially similar to a type-n connector and provides for easy coupling of multiple coaxial cables within a single connector housing. The method can also include contacting the refining mixture with a second metal oxide catalyst at a temperature of greater than 100 degrees Celsius to form a refined fatty acid alkyl ester composition. Localization of a defect can be confirmed using an x-ray emission detector.

1459828353-fa02044a-60be-468b-b0d5-1056b9db4d0b

The present invention provides a method of sterilization with an electrolytic water, including: electrolyzing a raw water with an electrolytic unit including: a cathode; and an anode at least having a part containing a conductive diamond to prepare an electrolytic water; and ejecting the electrolytic water to a substance to be sterilized, and an electrolytic water ejecting apparatus. The method may further comprise the mobile TV receiver decoding the series of video frames. The user's inputs defining the printing and finishing parameters are stored in a file such as, for example, an XML file. The feedback paths work in concert to turn the switches on and off together to prevent excessive voltage from developing across one or a subset of the switching elements. With the high static drilling fluid pressure released and with the high compression forces required to operate the drill bit the flexiblerigid drilling assembly transition into its rigid configuration and provide stability for a drill bit in drilling a straight horizontal drain hole. The lower device portion includes a projection display device disposed on a surface thereof for projecting an image onto the concave reflecting mirror when the lid is opened.

1459828354-4b8c8cca-682b-4a9f-bf3d-019d92efbeb8

Optical apparatus including a cladding-pumped optical fiber that includes a core that includes an active material, a multimode inner cladding disposed about the core, and a second cladding disposed about the multimode inner cladding. When a key is initially pressed, a controller searches, in a storage unit, for characters corresponding to the keys pressed, and sequentially displays the characters in a

current cursor position according to a predetermined time that the key is pressed. A plurality of magnetic poles and a plurality of phases in each pair of poles are formed when currents flow through the windings. A device isolating film formed between the first stack region and the second stack region for isolating the first stack region from the second stack region. The seal is spaced away from the circumferential weld that joins the end plug to the cylinder to reduce the hoop stress in the tube adjacent the weld, thereby reducing the tensile stress at the weld joint. The cleaning solution also includes an amino acid complexing agent and an inhibitor.

1459828354-52f3c4a6-d61c-4483-b670-93477509518b

A method and an apparatus accurately discriminates between speech and voice-band data in a communication network by calculating self similarity ratio values, which indicate periodicity characteristics of an input signal segment, and/or autocorrelation coefficients, which indicate spectral characteristics of an input signal segment, to generate a speechVBD discrimination result. In one embodiment, upon accessing the memory system for a piece of data used by a first process, a latency manager determines the access time to acquire the piece of data in the memory system. In this case, preferably, the gate insulating film of the transfer MOS transistor has a thickness which is not greater than that of the gate insulating film of the capacitor MOS transistor. In response to the filtering, if the at least one received datum represents a valid command, the method includes converting the at least one received datum to identify the at least one instruction.

1459828354-d967d3ff-538b-4241-a5e4-bf72d81240a8

A vehicle locating system includes a first transmitter within the vehicle, the first transmitter is configured to transmit a location signal; and a key fob including: a receiver, a direction indicator, and wherein the direction indicator is configured to point towards the first transmitter in response to receipt of the location signal by the receiver. In a first aspect of the invention, a program operation method provides varying program biases which are applied to different groups of memory cells. Modulation event tokens are managed, and protocol processing of the data with the peer is based in part on a result of the modulation event tokens managing such that protocol processed data is caused to be transmitted to the peer via the network nominally with desired data transmission rate characteristics. The multicarrier signal is built on a non-orthogonal time-frequency lattice with a density two. The thickness of the porous metal structure may also be modified to establish a thickness profile that optimizes mechanical and biological requirements of the implants performance. The insulating layer is removed at an edge of the memory area.

1459828355-0eff17a1-2359-4475-8170-8e5b31cf45cd

This invention discloses the use in the production of a polyolefin of a slurry loop reactor wherein all internal parts in contact with the slurry are polished first by a mechanical process to a level of at most 70 RMS roughness value and are subsequently polished by a chemical or electrochemical process, to a final level of at most 40 RMS roughness value. A reflow furnace is moved along a transport direction of a tape substrate and is fixed at a position matching the product pitch of a circuit substrate. At least one aftwardly facing load face is at the aft end of the nozzle segment at the outer band segment. , biologically active multi-chain polypeptides such as immunoglobulin Fab fragments.

1459828355-24efdadf-e96b-4aa6-86d6-144eacedf841

A low-priced contact type color image sensor formed without the need to provide color filters on a linear image sensor. In this way, optical proximity communication between the devices is possible. The electrodes are arranged to measure electric field in a direction along the direction of the cable. The controller performs image processing on the images and the real feature point, and

compares the real feature point with position data of predetermined feature points, and generates a bird's-eye view image.

1459828355-6ef257fb-efed-4de2-91c9-ac5cbef73341

A computer system includes a controller coupled to a plurality of memory modules each of which includes a memory hub and a plurality of memory devices divided into a plurality of ranks. The power generator includes a plurality of receiving elements having different directionalities with regard to the at least one of the time-varying electric field and the time-varying magnetic field. The laser level also includes an electronic distance measurement circuit disposed within the housing for measuring distance. After a moving image processing is completed, the still image is processed by an image correcting circuit. A control unit stores data about the absorption current signal derived from the small regions Q in locations of a memory which are addressed corresponding to the positions of the small regions. Further, the method comprises comparing the average to an efficiency threshold and generating a notification based on the comparison.

1459828355-c8a675b1-acdd-488f-aacd-a756d9f0695a

The invention relates to a forehead rest for respiratory masks. The route providing method generally enables a user to pre-select one or more destinations and trigger events, so that navigational routes leading to the pre-selected destinations can be subsequently generated and presented to the user when the designated trigger events occur. The frame also includes a first fractional segment that has a start time that is the same as the frame start time and an end time that is before the frame end time. The piston pump has a plurality of pistons disposed in the plurality of cylinders.

1459828356-097a7a33-8af4-4fca-9744-fbb9e33b5ee6

A server distributes a user edition application in response to a layout operation request sent from a client system. Embedded resonant cavities form an integral part of the referencing system. The jitter in packets received from a packet network is calculated based upon the arrival time of a packet, the length of the packet and the arrival time of a subsequent packet. Minimizing relative entropy may be a basis upon which to define a mapping of predefined probabilities to the new set of probabilities.

1459828356-1a56b7e7-6e91-445f-a98b-e741337cec9e

Compositions comprising hydrogenated block copolymers can be successfully used in a variety of applications including films, profiles, sheets, pultruded articles, fibers, coated articles, injection molded articles and blow or rotational molded articles. The reflective surface is capable of providing a non-reversed, substantially undistorted direct reflection. The complementary pair of transistors can be applied to either voltage driving or current driving pixel driver circuits. The second value indicates that the wide operand is not stored in the wide register.

1459828356-1e6ddf20-7327-4b7c-8d7e-7dee211e34cc

A variable ratio brake pedal assembly includes a support bracket having a mounting face and two spaced apart side arms extending from opposing edges of the mounting face. The single dual-piston fulfills the role of two conventional pistons in its linear back and forth motion along the combustion chamber by using both its front and back surfaces as an element of a combustion chamber within the cylinder. A rear differential is engaged with rear axles and the transmission through a rear differential gear set.

1459828356-a594238e-583e-40ea-a77c-366b582c2b6d

The fiber-optic sensor head for a current or magnetic field sensor comprises an optical fiber which contains a magnetooptically active sensor fiber and at least one polarization-maintaining supply fiber, which are optically connected, with the

sensor fiber having its fiber protective sheath removed. An optical amplifier amplifies the received input signal and delivers the amplified signal to an optical splitter adapted to split the amplified signal into two identical optical signals. A plurality of claws capable of engaging with the peripheral edge of the lower side of a small size disk are provided on the outer periphery of the small diameter support region. Direct current from the back-up power source is supplied to the inverter through a DCDC converter when power from the utility grid is unavailable to the load. An actual difference value between the second value and the first value is determined. A second reinforcement member may be adhered to the pouch casing and used with or without the first reinforcement member.

1459828356-b3ce5839-2146-430f-a660-7e8b5c146532

An electrical connector housing includes a first shell carrying connector mounts, fuse mounts and relay mounts. A subscriber may upload a digital image of himself and have it compared to digital images of other member subscribers using software to interpret points of comparison on each digital image. The computer system identifies a service description attribute that annotates an object of the annotated object oriented representation. The spring fixes the pressure plate on the transistor, so that a uniform pressure is applied to the transistor via the pressure plate, and, at the side facing away from the pressure plate, the latter accordingly provides a good thermal conduction to a cooling element. A rope enters and is reeved on the turntable and wheel, to constitute a tightening device permitting a one-way gliding of the rope.

1459828357-092baf49-a8e7-416a-a328-c7f1b80d4cee

An apparatus for operation with a nuclear camera of a nuclear medicine gantry and a patient handling system is provided and includes a cart assembly; and a collimator drawer assembly supported on the cart assembly. The inner shield includes a general C shaped substantially unvarying and uniform front end, and two legs extending rearward from the front end. The cracking resistance additive corresponds to a compound that is a liquid at both the low temperature performance grade for the asphalt and at mixing and/or storage temperature for the asphalt. Pivoting of the first race with respect to the second race can occur by the balls shifting their circumferential tracking path within the groove of the first race. The stretched film exhibits not only excellent transparency and gas-barring property but also excellent flexibility and shock resistance. The receiver comprises a control adapted to process a group of currently received signal samples to determine a corresponding current set of unquantized wanted data symbols and an interfering waveform representative of a sum of other unwanted data symbols by subtracting an amount of a previously decoded set of quantized wanted symbols and a previously determined interfering waveform.

1459828357-14e7f0e9-20d4-44fb-a063-eed3c5b8cdbe

A system and method for performing discovery of digital information in a subject area is provided. The method improves MIM capacitor performance by preventing plasma-induced damage to a dielectric layer during deposition of a top electrode on the dielectric layer, as well as by reducing or preventing the formation of an interfacial layer between the dielectric layer and the electrode or electrodes, in fabrication of the MIM capacitor. The lateral bipolar transistor operates as a charge injector. Additional accessory items such as knife blades or other tools may be foldably secured to the handle. The PSD may be in the form of an Applications Specific Integrated Circuit or Personal Computer Memory Card International Association Card. Also taught is a method for using the cover.

1459828357-88bf78b5-0108-47d0-b40e-34b13f5f4a6c

In a light emitting indicator drive circuit which supplies a current to display elements different in display areas, a constant-current is supplied from a P-channel MOS-FET to a display element and a pulse width control circuit controls a on/off ratio. In at least one of such apparatuses, the select transistor can include

a body region including a monocrystalline semiconductor material. A controller controls the output of the heating member and the second fusing unit based on the temperature of the recording medium.

1459828357-966530a6-63f1-4065-9307-e137d86bdb25

A multiply accumulator performs a multiplication-and-addition operation for a first multiplier with N bits, a second multiplier with N bits, and an addend with M bits, wherein M is larger than 2N. An ad channel includes ads and ratings that indicate a likelihood of interest of a user for an ad. One or more predictable instructions in the original files may be identified. A second transmitting section transmits inquiry information to the external terminal apparatus through the communication unit, the inquiry information inquiring whether or not to proceed with a second evaluation of the music piece. The thermal manager monitors a temperature of the central processing unit and dynamically controls a throttling of the central processing unit and the at least one fan according to a thermal management algorithm.

1459828358-04289b64-8fcd-447a-86bd-732bf8991dfb

A method and apparatus comprising a platform, a battery system, a power generation system, a number of charging stations, and a controller. The detection is based on the carrier perturbation method detected by a set of double gate comparator circuits that further generates an integrated signal driven to a digital analog converter. A magnet system accepts the examination region of the patient and generates a 3D gradient field for remotely-controls movement and orientation of the endo-robot in the patient's body by interaction with the linear magnet. At least one of the blank tapes is selected for copying the log data and the user data from the primary cache to the secondary cache based on priorities. In a further improvement, the male dovetail may be part of an intermediate member, which allows relative rotation of the equipment-specific member through a limited range.

1459828358-2dd6ab92-3516-4fa4-85ac-6cd5758bd7f3

Compounds described herein are suitable for use in three-dimensional optical recording materials, etc. The transparent elastomeric compositions can be covulcanized with rubbers such as polybutadiene, polyisoprene, styrene-butadiene rubber, styrene-isoprene-butadiene rubber, isoprene-butadiene rubber, ethylene-propylene diene rubber or natural rubber. The seating assembly further includes a single, continuous seat back attached to each of the seat support members and spanning the entire pew seating area, such that the plurality of seat members are associated with the single, continuous seat back. A unique battery charging device is employed to maintain the two banks batteries in constant substantially full charge.

1459828358-bdc8c6f9-6b01-4e4d-8052-c503e1ba6e21

A multifunctional shutting device for a lubrication filter includes a safety device with triple valve shutting. In one embodiment, the piece of material is a bowed shaped glass sheet that is supported by a conformable nosing device which has been configured to have a bowed shape that substantially matches the bowed shape of the glass sheet. The method includes creating link information for a first logical field from the plurality of logical fields. The PCB is fixed to the backplate by means of at least one magnetic element, and comprises at least one magnetic hole and the at least one magnetic element fixedly disposed in the at least one magnetic hole. External equipment is provided for using the signal outputted as an input signal and for executing a functional operation according to a type of the input signal.

1459828358-c999971b-68e9-4123-bbb1-e03c62363531

A microprocessor is for detecting an interrupt request during execution of a program, saving contextual data elements of the program being executed, sending an interrupt acknowledge signal, and jumping to an interrupt subroutine if the

interrupt request is still present after saving the contextual data. For example, two buffers can be used. Spontaneous coupling of the carbohydrate and the protein components under very mild conditions provided glycoconjugates containing up to 37 carbohydrate hapten units per carrier protein molecule. Although the rear end of the substrate is exposed outside of the transceiver, the shield gasket and the ground pattern on the substrate shield the contact portion between the substrate and the upper housing, and between the substrate and the cover. When one of two differential side gears is prevented from turning, the differential pinions turn independently of each other to permit a difference in speeds of the differential side gears, thereby enabling the power input sprocket gear to engage in normal power transmission. In one embodiment, the present invention describes a method for measuring blood glucose in a subject.

1459828359-2590b267-1bd7-4587-829a-c199c047ea0d

A first piezoelectric layer is laminated on a first common electrode and comprised of a first piezoelectric material having a first residual stress. The plurality of base stations may include interior base stations providing communications service for radioterminals in an interior portion of the terrestrial network coverage area and peripheral base stations providing communications service for radioterminals at a peripheral portion of the terrestrial network coverage area. Generally a one piece Z shaped metal bracket with a substantially vertical web between opposed top and bottom flanges in a parallel plane. The catalytic reactor receives the water and the carbon dioxide from the membrane separator, contains a reaction of the water and the carbon dioxide that produces hydrocarbon fuel and is facilitated by the nano catalyst, and uses the thermal energy from the heat exchanger to stimulate the reaction.

1459828359-40e7488d-ce0c-49e6-b381-dd56b1264c27

A method of masking cooling holes of a turbine component, in particular a turbine blade or vane, for a coating process is provided. It involves an augmented transcript that includes timing metadata that associates words and phrases within the transcript with corresponding temporal locations within the time-based media where the text is spoken, and editing the augmented transcript without the need for playback of the time-based media. In accordance with the color and the density of the image pattern, an accumulation time of the optical sensor is set.

1459828359-b69d3bd3-cf6f-43dd-a382-789cb34fdf8c

A container with a lid comprises a container body, a lid supported for turning on the container body and a rubber plate provided between the container body and the lid. The filter is constructed by determining the peak resonance in the structure frequency response above a preselected magnitude and computing a digital notch filter to attenuate that peak resonance. The controller includes computer program code adapted to receive a first result generated by inspecting a production substrate with a stand-alone inspection tool, and to receive a second result generated by inspecting the production substrate with the integrated inspection tool. In addition, the methods, apparatuses, and systems can reduce non-specific interaction with a surface of the microfluidic channel by providing a protective flow between the surface and a delivery flow. The driving circuit includes a selector configured for generating a selected test data signal, the selected test data signal being selected from the first test data signal when the driving circuit is operating in the external test mode. This polymer layer is provided with an adhesion prelayer of organic or organoinorganic nature.

1459828359-cf45305a-9bae-49aa-a31e-caeeb481c6b8

A method includes forming a dielectric layer over a substrate, forming an interconnect structure over the dielectric layer, and bonding a die to the interconnect structure. The peptides preferably are conjugated to or administered with a compound which facilitates delivery across the blood-brain barrier. of the light-emitting particle is identified.

1459828360-22e2be71-0597-4036-add1-8665c1fbd6ec

A laparoscopic surgical technique is provided for preparing a site for implantation of a fusion device or implant. Multiple printhead units are provided for generating image information bearing laser beams. The steady-state spatial performance for different sheet property modes is first predicted, thereafter, the dynamic performance is predicted on the basis of the steady-state actuator profiles.

1459828360-292dbc7c-f545-4b05-a473-bcc637eb2f7c

Stannous oxide particles having a methane sulfonic acid dissolution rate of 3. The system and method comprise receiving data pertaining to touchpoints and conversions of an advertising campaign across multiple channels. Each holder is provided with positioning grooves to decide the position of the recording sheet roll in the axial direction.

1459828360-a377095c-b471-4288-93e9-db9b5f95321f

The handgrip is inclined to one side of the bow's lengthwise axis to the right for a right-handed archer and to the left for a left-handed archer. An aircraft anti-icing system including such a device and the use thereof. Therefore, an interval between the two elastic pieces, of the elastic holder is increased when the square bar rotates, so that a firm and steady touch of a click can be provided. The cap includes a cap annular body and a cap closed end.

1459828360-d029eea3-077b-479f-89f0-25ff113475fb

Disclosed is an ultra-low temperature, dual-compressor, recirculating gas chilling system that includes a closed-loop mixed-refrigerant primary refrigeration system in combination with a closed-loop gas secondary refrigeration loop. Said method utilizes said receiver architecture to modify said receiver's receive path to simplify optimizations. The transport plate is surrounded by a housing which defines an inner upper side on which a heating and cooling device is provided.

1459828360-d476c40d-a0c0-4280-94df-601b621ba00e

The present disclosure relates to a polycarbonate resin composition, which comprises: based on thermoplastic resin 100 parts by weight comprising polycarbonate resin 60 to 80 wt %; and polycarbonate-polysiloxane copolymer resin 20 to 40 wt %, pearl metal particle 1 to 4 parts by weight; and colorant 0. Accordingly, the trader can be assured of receiving non-duplicated prices that are fed at a rate that is cohesive with that trader's connection speed. The composite particles in the wash mixture foster microbial degradation of the organic material within the wash mixture. A third internal conductor has a lead portion and a main electrode portion. An ultracapacitor coupled to the high voltage DC bus. The organic electroluminescence device exhibiting a long lifetime and high current efficiency as well as emitting blue light with high color purity, and also the aromatic amine derivative for realizing the organic EL device are provided.

1459828361-3b72e4f5-32a7-4927-b996-3a1d1f580c0a

A valve has a body, an outer shell and a bottom board. A first filter layer is disposed around the support layer. Potential alignments for the first and second tags of each read to a reference sequence is determined, wherein the potential alignments satisfies a minimum threshold mismatch constraint.

1459828361-5ef3fd8f-94f1-4304-82c6-f5b1140693e1

A rear-projection screen 3, including at least a lenticular lens sheet 32 and a Fresnel lens sheet 31, is configured so that the lenticular lens sheet 32 contains, in a base material thereof made of a resin, light diffusing microparticles made of a resin having a refractive index different from a refractive index of the base material, and the light diffusing microparticles satisfy 0. It comprises the steps of first treating such soils and ground water with an effective amount an aqueous solution containing a peroxide and a water soluble chelating agent for a time

sufficient to have the water soluble chelating agent chelate at least one of the divalent metals of the divalent metal compounds present in the soil and ground water. Read, write and erase functions for each cell make use of only two polysilicon layers which simplifies manufacture and each memory cell has at least two locations for storing a charge representing at least one bit.

1459828361-63c22a57-d7fa-4087-9ffe-bc24e5321dc7

Briefly, in accordance with one embodiment of the invention, an integrated circuit has a voltage regulator that is used to provide a power supply potential to a memory circuit while a logic circuit is decoupled from a power supply potential. Multiview videos are acquired of a scene with corresponding cameras arranged at poses, such that there is view overlap between any pair of cameras. Data is read by exciting the storage areas with a second directed light beam on the medium. A collar is positioned around the first passageway near an intake opening. Removal or destruction of an RFID tag or removal of a component in which an RFID tag is molded will cause the computer to deactivate the vehicle operating system, preventing operation of the vehicle.

1459828361-8bed04cf-0051-4c09-80e9-6103fa1ae68c

Disclosed herein are emulsion aggregation toner particles having less than about 15 atomic percent oxygen in relation to a total atomic percent of 100 for all elements on the surface thereof. Processing for increasing the rotational speed of the combustion fan is intermittently executed during weak combustion. In the case of in-operation level monitoring, the refrigerant overheat at the evaporator is registered and, in the event of excessive overheat, it is concluded that there is underfilling. The conditional delivery rule specifies a condition for the inclusion of a report template from the set of report templates to be merged with a static document from the set of static documents.

1459828362-0a8599d1-209e-43a1-82ea-f8519b22b623

A hollow coaxial cable adapted for conduction of radio frequency energy, particularly microwave energy, has a proximal end and a distal end and comprises coaxial inner and outer conductors extending substantially the entire length of the cable from the proximal end to a distal end portion of the cable with a dielectric medium disposed between the inner and outer conductors. A factor  $M$ , where  $M \leq 1$ , is defined for each sub-carrier on the basis of the values for the DC offset and for the carrier-frequency offset, and the reliability information for the sub-carriers is multiplied by these factors  $M$ . MRL has perpendicular magnetic anisotropy while MOL and sensing layer have a  $M_{st}$  value within  $\pm 150\%$  of each other. The first proxy mobile station receives forward channel signals intended for the first mobile station and transfers them to the proxy BTS for re-transmission to the first mobile station. The attachment interface provides for an electrically conductive and a bending stress opposing mechanical connection between the interconnect structure and the terminal.

1459828362-43bf599a-e78c-44d2-a0d3-1aada96d217b

To reduce EMI and current consumption in internal wiring after display data have been input to a data driver. The invention uses two or three membrane separation steps, optionally in conjunction with cooling/condensation under pressure, to yield a lighter, sweeter product natural gas stream, and/or a carbon dioxide stream of reinjection quality and/or a natural gas liquids stream. A collecting trough is positioned in fluid flow communication with the edges of the surface to which the fluid flows to catch and collect the fluid as it flows from the surface. The area sprayed can be surprisingly large compared with single-axis oscillators, or the area may be limited to a single row or a narrow rectangular area, by adjustment of the barrel and outlet movement and/or the water pressure. A method for producing an interlayer for routing and a system having a printed circuit board and an electronic component using the interlayer for routing are also provided.

1459828362-a1db098f-6ed4-4329-a7a2-dc8c18c11c27

An electronic radio system multifunction slice for a electronic radio system. More specifically, the control logic and method for implementing a plurality of memory cartridges which may be hot-plugged into a memory sub-system. Two actuating members are rotatably supported by the axle and arranged one on each side of the operating lever. 3, is expressed in testicular tissue and peripheral blood lymphocytes. Radiation treatment can then be delivered to the cardiac target taking into account the movement of the cardiac target. Because of the overlap of the bayonet sleeve and the main body acting in conjunction with the biasing mechanism, the bayonet sleeve is maintained in a stable, straight configuration, and signal loss or degradation is minimized.

1459828362-a3e83134-e861-4a0a-9649-d7dc4766f2ca

A decision flowchart of a triage protocol is provided for a medical condition of a patient. The controller also includes a table, in which standard power and a start-up power supply status are associated with each other for each of the trays, a table that manages total power required by the trays and present power consumed by the trays, and a table that defines maximum available power relative to the total power. Because music, especially electronically generated music, has a substantial level of repetitiveness within a single audio clip, the basic Lempel-Ziv compression technique can be generalized to support representing a single window of an audio signal using a linear combination of filtered past windows.

1459828362-c5b90e5f-22e5-469b-ba4d-2cd92b5474db

A magnet configuration comprising a pair of Halbach arrays magnetically and structurally connected together are positioned with respect to each other so that a first component of their fields substantially cancels at a first plane between them, and a second component of their fields substantially adds at this first plane. In this configuration, even when adhesion between the diaphragm plate 9 and the support plate 17B is insecure, and when a piezoelectric element 12 deforms a diaphragm 7 toward a pressure chamber 3, that is, in a direction away from the support plate 17B, the support plate 17A prevents the diaphragm plate 9 from peeling off the support plate 17B. The bypass stage has a first node and a second node.

1459828363-17c2f845-476a-4d7d-9bc7-ece88a5a3a28

While performing data transfer for reading data from a source disk or disks and writing the read data to disks of a disk array, data reading is repeated until accumulated read data can be split into several sub-data with a data size of each sub-data not smaller than a write maximum. The first storage device stores a first plurality of web pages and receives a first signal from the remote device indicating selection of one of the first plurality of web pages. The system and its related method may improve engine operation in conjunction with detecting an alcohol concentration of a fuel. The supporting stand has a movement recess formed on the supporting stand, a movement space formed in the movement recess, and a moving assembly mounted in the movement recess.

1459828363-23055c32-cd27-4289-9da2-ded882c2f373

An apparatus for performing data caching comprises at least one cache memory including multiple cache lines arranged into multiple segments, each segment having a subset of the cache lines associated therewith. , to user devices in a mobile communications network. To create the automaton, an optimal solution searching part of the analysis processing part generates, responsive to an input word entered into the automaton, states necessary for transition according to the concatenation rules corresponding to the input word without generating any state that can be transited by pursuing a null transition succeeding the generated states. The ferrule holder includes an alignment key exposed to mate with a cam activation tool to lock rotation of the ferrule holder relative to other connector components. The main ignition is then performed to cause main burning. The refrigerator is optimally

operated in ice-making and ice-separating modes based on the amount of water supplied for making ice cubes, and a control method thereof.

1459828363-4bed28ab-72c7-4526-bfb4-13c4b4e87d25

An electronic circuits module includes a cover and a base. The disc storage portion has a disc window and a bottom and stores a disc, having first and second sides, therein so that the disc is rotatable in the disc storage portion and that the first side of the disc is exposed. As work orders are pulled from each of the queues, each work order is sent to a thread pool matching the priority, where the work order is executed. Crosslinked polymer carrier fluids are identified that are not damaged by contaminants present in the fibers or by degradation products released by premature degradation of the fibers.

1459828363-6ea0826f-9a33-4e89-9c29-5f560c3c350a

A torque wrench for use in driving fasteners is provided. The multiple layer flakes can have a symmetrical stacked coating structure on opposing sides of a reflective core layer, or can be formed with encapsulating coatings around the reflective core layer. In another embodiment, gain and threshold are adjusted in a coordinated manner wherein gain is adjusted for low signal levels and threshold is adjusted for high signal levels.

1459828363-d57f56a8-ee5c-4ba4-9a00-734df881beac

A novel soybean variety, designated XB20D10 is provided. The puzzle game can utilize a framework including a portion of the puzzle image such that the user can determine where to place the puzzle pieces without having to see a version of the final image, which can save display real estate as well as provide suspense and additional challenge for the user. Methods for producing a maize plant containing in its genetic material one or more traits introgressed into PHB00 through backcross conversion and/or transformation, and to the maize seed, plant and plant part produced thereby. The shared data can be selectively downloaded for use by the other device as long as the devices are in proximity.

1459828364-0eca1dd9-3064-4b1d-af91-5b71f7596821

A light emitting device including a light emitting chip and a magnetic material is provided. The invention is more particularly applicable to Plasma Display Panels to improve the picture quality. A second supporting member is mounted detachably to a second axial end of the supply reel, and rotatably supports the second axial end of the supply reel. The dramatic improvement in amplitude of the vibration at the tip of the nozzle is without precedence in the prior art. The financial transaction network enables customers to continually interchange account values relating to any financial product, or financial service within the network.

1459828364-ab112feb-db03-4c56-ae13-94a125127648

The invention provides a 03 type piezoelectricelectrostrictive ceramic composition excellent in the electric field-induced strain at the time of high electric field application. At least a part of the crown 6, at least a part of the sole 8, or at least a part of the side 10 is formed by a porous part Ps including a porous metal. The method includes several etching steps performed on the layers of the material substrate that are different in thickness. In particular, as multiple processors compete for the same cache line, a significant amount of processor time is lost determining if another processor's cache line lock has been released and attempting to reserve that cache line while it is still owned by the other processor. The computing device is register, over the local area network, with a server using the user specific data extracted from the scanned QR code. An example method includes activating a firearm-mounted camera system, receiving a switch input from a user selecting a camera, generating an image of a portion of an environment with the selected camera, and displaying the image on a display panel to alert the user to conditions in the portion of the environment.

1459828364-d8d38693-abd6-47b0-a7a1-20968530b5a4

In one aspect of the invention, an attack tool is disclosed which comprises a wear-resistant base suitable for attachment to a driving mechanism. The kick plate is further adapted or operatively configured to be re-orientated in a stowed position where an upper surface of the kick plate operates in conjunction with an upper surface of the carriage to function as a table like support. The reflector is configured for shadow-free exposure of a second, opposing major surface of the workpiece to a flash heating energy. The components further may have a flexible frame, which allows the water treatment media to dynamically adjust to swelling of the filtration media and other forces that may occur during use. The apparatus then manages the maximum amount of data to be transmitted over the management time period for thereby leveling the amounts of data transmitted.

1459828364-ecf803f2-7f8d-402e-a3af-3afa3fb2d77f

Device-to-device contention management systems and methods provide managed offloading of cellular network traffic through a contention-based network. The projection is complementarily disposed in the groove to press the adhesive for forming a first waterproof structure. Signal areas are summed for each individual analyte to quantitate the total analyte amount. Data is read in response to a result from the address written in the register being placed in the control and status registers portion of the host bridge.

1459828365-065d206a-c676-4d30-af27-6d0b8eef98f2

A frame for bracing a gate includes a first and second upright brace having respective outboard edges positioned flush to opposite vertical edges of the gate. An exemplary embodiment receives the supplemental weather information from a remote source, determines a location of the supplemental weather information relative to the craft, receives weather information from an on-board radar system, and integrates the supplemental weather information with the weather information received from the on-board radar system. Initially the broadcast multimedia is transmitted at high data rates in order for a buffer associated with mobile device to be built to a very long buffer length. Blur correction is performed on the corresponding image frame using at least one auxiliary image frame in at least one other buffer location. The second transmission unit is received within the measurement time window. In one embodiment, the SRAM device includes: an SRAM array coupled to row peripheral circuitry by a word line and coupled to column peripheral circuitry by bit lines and an array low voltage control circuitry that provides an enhanced low operating voltage VESS to the SRAM array during at least a portion of an active mode thereof.

1459828365-49e30f52-90f7-4db3-b6d2-13f502ee2b58

The wet steam exiting a low pressure steam turbine does not rapidly attain thermodynamic equilibrium because insufficient condensation nuclei are present in the phase transition zone inside the turbine. The method includes driving the vehicle forward substantially straight above a threshold speed, sensing a yaw rate of the vehicle, and sensing a measured hitch angle of the trailer. This makes it possible to dispense with a complex turning device assigned to the wafer.

1459828365-4b221d48-ddf2-4adf-bca7-2f1c1f8a2cb1

A method and apparatus for segmenting data into TCP data segments using a first network communication component, and transmitting TCP data segments over a second network using a second network communication component. Also disclosed are interchangeable mounting brackets for mounting screens of varying sizes, or for mounting screens in various configurations, and hingeable and rotatable support members for supporting the screens so the screens are swingable to face in opposite directions. The second gripping members have walls with holes for the passage of screws during fitting thereof to the mounting bodies. This is converted into a joint probability of possible intensities for the missing pixels in the low resolution dataset as a function of the intensities of the corresponding pixels in

the high-resolution dataset to provide a very rough estimate of the intensities of the missing pixels in the low resolution dataset. The virtual target is a possible location for completion of the item action with the first item.

1459828365-a867d772-10d6-4284-9743-e4f7fda07a9f

Embodiments of the present invention address deficiencies of the art in respect to trusted platform module unification in a trusted computing environment and provide a novel and non-obvious method, system and computer program product for trusted platform module data harmonization. The base has a plurality of raised pads defining coplanar supporting surfaces. The gray scale control registers can be set using a data bus for transferring the display data from a liquid crystal controller, and the gray scale control operation is performed by the liquid crystal controller in accordance with the image data. The locking mechanism can be deactivated, placing the device into the normal mode of operation, when a specified condition is satisfied.

1459828365-f68c92d7-3bcd-4539-82dc-e607e42c8b18

Methods and systems for a disabled user compliant video player for an end-to-end streaming web video solution affording accessibility for disabled users, including blind users and those with partial or poor vision, colorblind users, deaf users and those limited to only keyboard voice input. According to the invention, the source network site is arranged to select which connection is used at the source end and which connection is used at the destination end, and base the selections at least partly on the basis of a round trip time value and a packet success rate value. The sign-indicating signal indicates a first sign when a control signal is greater than a predetermined value and indicates a second sign when the control signal is less than the predetermined value. Multiple regression analysis is used to identify those characteristics that affect the relation between prices and profits.

1459828366-2ea5629d-6968-4097-9406-22ff5fd2cb2c

A check rail arrangement for a switch or an intersection, the arrangement including a grooved rail provided with a grooved rail head, a groove and a lip, and a check rail which is supported at least on the lip and is arranged by a fixing mechanism in such a way that it can be displaced in relation to the grooved rail. According to a preferred embodiment, the composition comprises a mixture of ethanol and food-grade mineral oil where the ethanol is present in an amount sufficient impart antiseptic properties. The brake shoe is arranged to apply a braking force to the spool.

1459828366-3d8d4cc9-6d32-4dc7-ad90-bbfd6334e144

The present invention provides a sense circuit for DRAM memory cell to cover the events that a sense time becomes remarkably longer when a power source voltage is lowered, a sense time under the low voltage condition becomes shorter when temperature rises and a sense time changes to a large extent for fluctuation of processes. On this rotary shaft, a distal end lower face support member, an upper face slash member, and a sheet alignment paddle member are coaxially mounted. A clutch is positioned between the combustion engine and the third rotational member and a further clutch is positioned between the combustion engine and the first rotational member.

1459828366-93da8d01-b969-47ea-a04e-04dc02d6c98c

A thermoplastic resin composition having 100 parts by weight of a resin mixture of from 20 to 98% by weight of a polycarbonate resin and from 2 to 80% by weight of a styrenic resin; from 0. The device includes a footboard which is formed so that a foot is seated and supported thereon, and has a pair of facing locking brackets and a foot support part for supporting a foot. The support element includes a member which has an inverted T-shaped cross-section, which defines the second and fourth surfaces. The interconnect includes interconnect contacts configured for bonding to, and then separation from component contacts on the components. A first ion

implantation mask pattern is formed over the first gate electrode while a second ion implantation mask pattern is formed over the second gate electrode. As the AC cycle progresses, the appropriate compensation signal is added to the output of a conventional current controller.

1459828366-ad80e7b7-f120-4df4-8456-34fde5a00a04

A docking device is used for docking a portable computer. When the web page user initiates a help request, a client agent may automatically provide a service provider with information, about the particular web page that is causing the problem, sufficient to enable the service provider to access the web page. Compositions are also disclosed which include mixtures of fly ash, particularly Class C fly ash alone or in mixtures with Class F fly ash, alkali metal salts of citric acid, foaming agents, a calcium sulfate such as calcium sulfate dihydrate or hemihydrate and an optional portland cement.

1459828366-b0a8d81a-83d4-4ae8-a3e1-3a3f3b31624c

An alkyldiamine having excellent polymerization reactivity, a polyimide comprising it as a constituting element, and a liquid crystal alignment film excellent in uniformity of liquid crystal alignment, are presented. The summer combines each of the tap weight updates with one of the tap weight update offset values to produce modified tap weight updates which, in turn, are provided to the equalizer to adjust the tap weights. If a user inadvertently attempts to start the operating system before the recovery operating is complete, the operating system will not boot until the recovery process is complete and the required file is written to the appropriate directory on the hard drive. A plurality of coaxial cables having respective internal and external conductors connect the input and output terminals to the relay contact terminals. The server contains a random image size generator that generates at least two additional images of the marketplace item for display in a seller marketplace item web page to advertise the marketplace item. The image pickup apparatus includes an image pickup lens 11, a microlens array section 12 where light passing through the image pickup lens 11 enters, and an image pickup device 13 sensing light emitted from the microlens array section 12, and the focal length of each of microlenses constituting the microlens array section 12 is variable in response to an applied voltage.

1459828367-0e468bb7-4fc1-4d82-8d26-9cb8ec0fd607

A system for perfusion management that monitors, maintains, diagnoses, or treats perfusion deficiencies. Integrated on the RxPIC chip, starting at the input end which is coupled to receive multiplexed optical data signals from an optical transport network is an optical amplifier, an optical demultiplexer, and a plurality of on-chip photodiodes each to receive a demultiplexed data signal from the AWG DEMUX for optical-to-electrical signal conversion. The release may be operated when the gate is in either the open or closed positions.

1459828367-11195e03-2303-4574-8b95-39b9e4f5caca

A wiring member is provided that can suppress an influence due to deviation of a position of connection as much as possible so as to maintain a good wiring state. The game is individually progressed by each cellular phone. The second region may be doped with implanted phosphorus and the third region may be doped with implanted boron.

1459828367-14df084e-75b0-4ba1-94a3-0a9c9fd03276

In some embodiments of the present invention, a vending machine display apparatus and method includes a controller, a display electrically coupled to the controller and adapted to be coupled to the vending machine in a location externally visible on the vending machine, and a power line coupled to the display and adapted to supply power to the display. The FSU includes a first vacuum stage, where vacuum pressure is created by an ejector and a second vacuum stage where vacuum pressure is created by the ejector and a vacuum pump. Accordingly, the problems of

conventional methods, such as sinking of CNTs caused by screen printing, residual CNTs remaining within a gate when a lift-off method is used and short circuiting between gate and cathode due to the residual CNTs, can be solved. Each of the light emitting units are connected to respective driving thin film transistors, have relatively longer lengths in a first direction, and have the same width in a second direction substantially perpendicular to the first direction. The two devices then use the networking information to establish a computer network connection over a public computer network that couples the first and the second LANs for point-to-point communication.

1459828367-4fbc40b4-7e4d-49b0-a82d-3df1dd7bd104

Provided is a conjugated poly compound comprising an arylene unit having adjacent substituents, said substituents being oriented such as to affect the electronic structure of the compound sufficiently to cause a blue-shift in the photoluminescence and/or electroluminescence of the compound. The front frame is secured to the back cover to form an accommodating space. The sensor switching region preferably includes a plurality of floating contacts positioned adjacent and lengthwise extending outwardly from said switch detecting circuit region for defining a plurality of released beams so that each of said plurality of released beams displaces in a predetermined direction responsive to acceleration. The first and second portions of the attachment system cooperate to permit selective removal and reattachment of the cover wrap on the cylinder. Also described is a vehicle having such a brake system.

1459828367-e4a3be68-7cea-47e3-8482-022cd4ba3edb

An imaging apparatus includes a body mount to which an interchangeable lens is attachable; an imaging device; and a circuit board. The wire may include an elongate flexible core formed of a conductor material and a cladding layer covering an outer surface of the core. By pressing a pressing switch of the modulized switch circuit, a light emitting element electrically connected to the modulized switch circuit can be controlled to provide or shut illumination thereof.

1459828368-f0fa4d5c-aa5c-4ee9-82fb-ed48ca496025

A method for improving muscle control, muscle tone, and sensory integration of an individual by applying polyacrylamide gel to the skin overlying the target muscles. According to said method, an aqueous preparation of the polymer which contains at least 30% by weight polymer, optionally in admixture with other washing and/or cleaning surfactant ingredients, is granulated and at the same time dried batchwise or continuously, preferably continuously, in a circular fluidized bed. A substrate is laminated to the thermosensitive layer on the back surface of the film for providing additional support independently of physical and chemical properties required for directly supporting thermosensitive imaging material. Pressure events occurring in a single section of the wellbore bounded by any two sensors can be isolated and analyzed. The deposition may be performed on either treated or untreated substrate. A distinct sequence of steps between the computer in the machine and the specialist's computer minimizes the chance of time-wasting errors in establishing communication.

1459828369-29b162c2-fc8f-4bc6-9554-9323c2586dc8

Various embodiments of the present invention are directed to a fleet management computer system configured for assessing vehicle backing. According to various embodiments, the fleet management computer system is configured to assess operational data associated with one or more vehicles and identify vehicle backing events occurring during a particular time period. The deburring means comprises a prism having rounded longitudinal edges. In the specific implementation, the first circuit is a cellular subsystem and the second circuit is a Global Positioning System subsystem.

1459828369-4658c428-7873-4bbd-94a8-c8f3dc076b44

A computer testing platform for supporting computer hardware components in a highly visible and readily accessible manner for diagnostic testing and repair includes a housing made from clear acrylic plastic and a plurality of bays for storing the components. These summary frames are embedded in the broadcast and appear in a small window on the screen at some point in the future as the video is broadcast. Each hypertext transfer protocol request generated by the browser includes an indicator of the configured preferences. The sanding disk may also have a plurality of arcuate slots which are adapted to align with radial holes in the pad of the rotary sander. The hard or rigid shell serves to contain the elastic or resilient core and may include copper. Then, during the subsequent annealing processes, the faster moving PFET impurities will be restrained from diffusing too far into the channel region under the gate conductor.

1459828369-4e82533d-3ba4-4b35-995b-8d73ab94dec4

An error-correction coding method that includes outer coding of performing a coding process for an outer code; and inner coding of performing a coding process for an inner code that has an error correction capability adjusted based on an error correction capability of the outer code. The image display device includes a first polarity converting unit to convert luminous flux from the light source to S polarized light, a first polarized beam splitter, and second polarized beam splitter. The receiver performs channel estimation and determines an estimated channel response matrix. With this, a gas-liquid separation distance of the refrigerant increases. The second signal is processed at least in part on the basis of the harmonic feature of the voice component to remove at least in part the echo component such as to derive an echo reduced signal.

1459828369-ca05107a-f54e-4c0e-abd6-b47fc6157672

The invention provides, in various embodiments, systems and methods relating to controlling ion behavior in an ion-based analysis system. The laminated balun transformer includes a magnetic substrate, a laminated body, and external electrodes. A first end and a second end of each trimming electrode are connected to the spiral coil pattern portion, and a lead out electrode, respectively, so that the trimming electrode bridges between the lead out electrode and the coil. Upon the occurrence of a triggering event in the system, the system predicts the motion and position of the person. If the user does not delete the cookie, then a later request from the Web browser includes the cookie and the encryption key.

1459828369-f8b38c7b-b6ef-461d-bc5f-7ae094c02df6

Devices and methods for laparoscopically repairing a hernia are described. In power feeding regions, the semiconductor layer and the insulating layer are removed. Then, the glass substrate is machined while being irradiated with a pulsed laser for a plurality of times, thereby improving the machining shape of the glass substrate. The lamination takes place by laminating a partially cured sheet to at least one other sheet of dielectric material and one of the conductive sheets.

1459828369-fe6b93d8-d51b-47fa-9fe8-2edcb9b2f33c

A device for measurement of the spectral reflectance of a surface where the reflectance factor of light with a certain wavelength can be measured in a wide wavelength range, including the UV range, and in which a reference reflectance factor can be easily obtained. The position, attitude or both of the head with respect to a reference frame may also be monitored for translating and/or transforming the monitored visual axis into other reference frames. The second lens element has negative refractive power. The controller synchronizes its control signal with the mains signal.

1459828370-0d59e23b-fdfe-49d6-ba74-fec41371a679

Methods and apparatus for controlling the registration of one elongated continuous structure with attachments or formed features as it is fed to a sealing station, where it is joined to another elongated continuous structure with formed features.

Mobile data processing systems interact with each other as peers in communications and interoperability. The sensor detects movement of the paddle.

1459828370-3b67ba20-b398-4644-9fcc-9e1736aa538d

Users call ONE telephone number from their computer communication link-up. The switch is coupled to the inductive element to generate switching cycles. The cutout portions of the drum shell can also be filled with other materials to further modify the acoustical properties of the drum and lighting can be provided in the interior of the drum allowing light to be passed through the cutout portions of the shell.

1459828370-b0e80a71-4503-42b4-94ba-082c1f38469a

The present invention relates to a video communication system and a video communication method along with a computer readable recording medium which records the video communication program. The hub has a connection section formed therearound and the connection section has a first side and an opposite second side. The entire metal foil is in contact with the adhesive layer, and the metal film layer is in contact with the electrode pad.

1459828370-f923dac7-398e-4133-be8a-86d3c29e7a3f

A molding machine according to the present invention includes a plurality of drive mechanisms driven by servo motors and a controller for controlling the respective drive mechanisms. Each client generates a report signal indicative of a current latency tolerance associated with a performance state. These values are entered into a table in memory. The decoder circuitry includes a parity check value estimate memory. A waste ink absorber with rough density to which an ink droplet ejected by the pre-ejection directly collides, solves the above-mentioned problem. A \u201cthird\u201d step of the method is identifying descendents of any data identified, e.

1459828371-71453ca3-f87d-4323-b5dc-f8e5345c80be

A bender wrench for removing fasteners from hard to reach places. Whether a failure has occurred on the side of the first device during the submission of the print information is detected. A method for controlling a gas flow rate in an axial flow gas turbine engine is also provided. The method and system further comprises capturing and storing the system media access-controller address of the connect computer in the additional logic of each of the plurality of wall plates and storing a physical address of the wall plate in the logic of each of the plurality of wall plates. The analog signals are sampled such that no two analog signals are sampled during a single fixed period.

1459828371-a800c86b-ee5d-4bc1-9a4c-e85119dfdbd6

A lens barrel is provided with which manufacturing costs can be reduced. The second tray is movable between a first posture and a second posture. The airfuel mixture is combusted over a combustion catalyst positioned in physical contact with a heat spreader, which itself is positioned in physical contact with a heat acceptor surface. The switching logic selectively connects the USB peripheral devices to different selectable ones of the USB hosts.

1459828371-ee044742-7409-4a5f-b29e-51bb34727e9f

An ultrasonic wave transmitterreceiver is provided in which the transmissionreception range thereof in at least one direction is relatively narrow, and which has stable reverberation characteristics. The coupling unit includes a shifter having an input and an output and a control input, the input being coupled with the output ports of the memory, the output being coupled with the instruction fetch unit, and the control input being coupled with the instruction stream request control unit. As each circuit path is tested, tested circuit nodes along the circuit path are marked as \u201cexercised. In one embodiment, the frame has first and second cross-arms and an elongated member spacing the cross-arms from each

other.

1459828372-4307b918-8ad3-4a53-97ce-e66e100ac109

A hybrid drive type vehicle having a permanent magnet type synchronous motor can provide high torque characteristics in low revolution speed range of the engine and high power generation characteristics at high revolution speed range of the engine. The system also includes a lift system in the vault, the lift system including a screw drive and a track system. In some instances, the query result data is generated based on the pre-existing risk assessment data. This device is built with passive elements, i. When precoding matrixes are required for the initial transmission, precoding matrixes having the minimum similarity with each other in the spatial direction are selected according to the retransmission rank, and then orderly used in multiple retransmissions. The cover has a first end region and a second end region with at least one elastic section positioned between the first and second end regions.

1459828372-b117cf3d-f286-4fa6-971d-70621bb704d1

Some embodiments of the invention provide techniques whereby a printer driver may be modified and supplemented over time. At least three sensors of a device can be used to determine locations of a beacon. When other PCs in the subnet want to share the multimedia broadcasting program with the first PC, they sending sharing requests to the first PC, and the first PC forwards the sharing requests to the wireless data terminal. In one embodiment, sensor wires and portions of the panel frame have similar coefficients of thermal expansion to substantially eliminate environmental expansion effects that may result in false alarms.

1459828373-037464ab-8ffc-4411-a45b-3989110f1641

An apparatus for obtaining tool face angles on a rotating drill collar in substantially real time is disclosed. 5 to 20 threads/cm and having a linear density of at least 420 dtex, and a second set of threads having 0. Each correlator typically receives and despreads input samples with a respective despreading sequence to provide despread samples.

1459828373-7742cb11-d1a7-48c8-982b-d42cd3b725cf

A flash recovery timer and warning device is a hand-held electronic device using a bright flash to create a temporary glare-type vision blur to the eye to be tested and a target and timer to determine the amount of time required for the eye to recover after the flash. Input images are received by a plurality of image capturing units respectively. The composition preferably has an -value greater than or equal to 4. Additionally, noise tolerance may be increased in the fast tracking and the slow tracking by using tracking envelopes. The direction vector determination section rotates the direction vector such that an angle formed between the direction vector and the tangent vector is maintained, and the rotated direction vector will be a new curved surface.

1459828373-ccedf3af-d9ad-4dbe-a91e-4092256300e1

An image data processing apparatus of the present invention includes: a base clock output circuit for outputting a base clock; a plurality of image processors; and a plurality of external PLL circuits provided for each one of the plurality of image processors. The lens frame is supported freely movably back and forth by an internal driving ring turned and driven when automatic focusing. A wireless data server receives a data message addressed to the mobile station. An ID giving section may provide ID information to one of the containing member and the recording medium.

1459828373-f4f01bb7-c813-42a0-9e11-c15fb5248fae

Methods of reclaiming plastic from infectious medical waste and manufacturing medical devices from reclaimed plastic are described. In the ringtone system, for a call from a calling party, the calling party is prompted to identify the type of

the call. In a space region of the N-channel transistor region 103 other than the N-channel functional transistor forming region 105, a power source capacitor forming region 106 is formed at a portion of the P-channel transistor region 102 opposing the P-channel functional transistor forming region 104. chamber air temperature and a light intensity of 0. Database records correlating location information with restrictions are accessed.

1459828374-3b2aa660-1660-4bf8-a872-05136526b523

A memory module having series-connected printed circuit boards is provided. The CTI server includes an analysis unit, an icon creating unit, and an icon display control unit. The metal ribbon integrally includes nail sections which protrude outwardly from said tack strip.

1459828374-8cbd436a-11c7-4b03-9c79-83d3d0e3c3b4

A metal casket that is readily assembled at a location remote from the location of manufacture. The invention furthermore pertains to a board formed by a plurality of strands of wood that are compressed and bonded together with an adhesive, wherein the board further comprises a flame retardant chemical composition, said composition comprising a phosphate compound. The module has a projector for generating light images of the dynamic process images.

1459828375-56b5f771-0607-474e-bef4-c9f5efc5293a

A method of interconnecting terminals so as to obtain an excellent electrical connection between terminals such as opposing electrodes and a mounting method for semiconductor devices using this connecting method are provided. Such a zirconium-base alloy for nuclear reactors comprises 0. Each coil is characterized by coil parameters including an axis orientation, a cross-sectional area, a number of turns, and a location. By quantifying the number of damaged RFID tags, a determination can be made as to the progress status of the catalytic process. The room model is used to calculate a model of an audio channel from the loudspeakers to a listener.

1459828375-cad0cc4f-10b2-49ea-bbf9-eedc4bde7816

A battery replacing apparatus includes a battery mount portion, vehicle hoist members, and a lifting-lowering means for lifting and lowering the battery mount portion. The microspots may then be simultaneously irradiated and the resulting ions detected by mass spectrometry, such as time of flight mass spectrometry. The method also includes modulating the P-SCH sequence and mapping the modulated P-SCH sequence to subcarriers within a predefined subcarrier set. The second section also has outwardly extending arm members, slotted at their ends and held in position by a spring which creates a compressive force within the second section. The entire device goes into a bag, e.

1459828376-9ea1fba8-f0fc-4d22-9b98-6f0cb3d5bf87

This invention provides a method for contactless fingerprint detection and verification comprising illuminating a fingerprint and directing a reflected light through an imaging system using liquid crystal panels and birefringent elements to polarize the light. A screed head is mounted to the frame portion and is balanced such that the screed head is at least partially supportable on an uncured concrete surface. This arrangement improves transistor characteristics and reliability of gate oxide films of the peripheral circuit MOS transistors.

1459828377-b85cb9f0-5f24-4b72-8a89-b8e2eb471911

A fuel cap 10 maintains high sealing even when subjected to external force; is easy to operate; and requires minimal space for accommodation. The timing controller encodes first gray scale data of a present frame, decodes encoded second gray scale data of a previous frame, compares the first gray scale data with the second gray scale data, and generates compensated gray scale data based on a result of comparing the first gray scale data with the second gray scale data. Oxide films

are formed on main discharge surfaces of at least the protrusive supporting portions of the pair of main discharge electrode members opposite to each other, by performing an oxidation treatment, respectively. This disguises the current profile of cache hit and miss events, which enhances the security against statistical attack techniques based on the evaluation of the current profile. A second control device is connected to the source of the fluid pressure for regulating the supply of such predetermined pressure to the operating mechanism thereby causing an automatic application of such brake by the hand brake assembly. The stacked bulk acoustic resonator further includes an inner raised region formed in an inner portion on a surface of at least one of the first, second and third electrodes, and an outer raised region formed along an outer perimeter on the surface of the at least one of the first, second or third electrodes.

1459828378-77b75c6f-ed19-4e14-abc0-e6361a977b8f

An engine oil heater suited to use with an engine having an oil fill port in fluid communication with an oil reservoir that is adapted to contain a quantity of oil. A first pivotal support brace includes a distal end and a proximal end attached to the first support pedestal. In order to solve this problem, a belt gripping roller can be brought into pressure contact with the pressure belt in the event of a jam, so as to prevent the pressure belt from being moved accidentally in the width direction while the jam is being cleared. A camouflaged panel is secured to the mounting bracket and, in turn, to bow by the first support arms and hooks. The frame structure is fabricated so as to define a duct about the propeller and the duct provides a flow of air to both a main flow passage and an auxiliary flow passage which are separated by a dividing wall or splitter plate.

1459828378-97feaecf-6482-40d2-b5d8-b3b8baecb1b3

A system and method of acquiring and processing full elastic waveform data from a vertical-force source comprises providing seismic waves into the earth from the vertical-force source, sensing reflections of the seismic waves at multi-component geophones placed along the surface of the earth, and processing the reflections of the seismic waves to generate full elastic waveform data. Chambers nest within one another to form a stack of chambers for transport or storage. In the packet queue, at the time where the final ATM cell forming a packet is stored in the virtual connection queue, an identifier of the virtual connection is stored. A predetermined value will be transferred to and held at an output Q of a second circuit element triggered by the output Q of the first circuit element, and the predetermined value will be cleared from the output Q of the second circuit element a predetermined time period after being triggered. The connector joins the ends of successive cords utilizing the outwardly projecting shoulder provided on the female socket of one cord in cooperation with a latch member on the male end of the connecting cord to lock the two cords together.

1459828378-c68f8d9c-538d-45d4-b05a-551f1e5a97a5

An active control device is disclosed comprising an array of actively controlled oscillating air jets disposed on an aircraft structure. In one implementation, the location of a client device may be obscured using a first random offset and a second random offset. Capacitance, impedance, and phase change data associated with the sample are generated at two frequencies. The edible film may be decoratively prepared into predetermined decorations prior to distribution, which may include being pre-printed, pre-cut, colored, or being of pre-selected opacity and sheen. A pressure assembly forces steam into the exterior pressurized housing while the transfer device is adapted to maintain a selected pressurized environment.

1459828379-136aa8d7-cca6-474c-a7c0-49d8247b850c

The present disclosure includes apparatuses and methods for sensing data stored in memory. The precursor solution can comprise 1-20% excess lithium with respect to a stoichiometric composition of the ceramic powder. Damage to the exhaust muffler is avoided by actively and/or passively cooling the connection pipe. The system

eliminates the need for an exterior lock assembly and its attendant inside lock button or rod.

1459828379-338293b7-0c85-4d84-8450-51b06f7b2612

The present invention is directed to a system, method, and apparatus for orienting images. With this structure, because the spread of a depletion layer from a drain side is restrained by the pinning regions 105, a short-channel effect can be restrained effectively. The removal of the crystal of an alkali metal sulfate in the step is performed by a solid-liquid separation in a state that the crystal of alkali metal sulfate is precipitated by concentrating and heating the solution that is obtained by adding sulfuric acid in the step and succinic acid is dissolved in the solution.

1459828379-734b63bb-e93a-4532-85f5-596119611879

A vehicle uses electric power from a mounted power storage device to drive a motor generator by a PCU to generate traction driving force. The assembly includes a substantially flat, flexible tape having first and second ends, wherein at least a portion of the tape is adapted to be permanently implanted into a female patient's body as a loop beneath the urethra. An armature is connected to a control valve in the module. Consequently, energy for tempering the water in the water jacket and/or in the water bath can be saved. Adaptive embodiments allow the generation of designs applicable to a particular medical purpose. The checking device has a movement element that can be moved along a boundary which separates the convertible top stowage volume from the luggage stowage volume and which can be remotely controlled.

1459828379-e43d3ff9-d642-4a7c-b047-f75fe9ff7318

The present invention relates to systems and methods to generate stored procedure calling code. A shock sensor is attached to the flange portion. 1 \u03bcmminute or less with regard to a hydrosilicofluoric acid aqueous solution that is maintained at a temperature of 45\xb0 C.

1459828380-44495981-f37b-43d4-9dcd-1d659d48c165

A method of forming an electrode on a semiconductor wafer by plating is disclosed that is able to reliably prevent leakage of a plating solution during the plating process. Thus, a printing apparatus includes: a first correction unit, for correcting a print position at accuracy equal to the resolution of the printing apparatus; and a second correction unit, for correcting the print position at accuracy higher than the resolution and in the range of an area that corresponds to one pixel of the resolution. While showing lower toxicity, they also effectively inhibit the cerebral neuronal cell death caused by ROS and/or zinc ion, and show neuroprotective effects against ischemic neuronal degeneration. The same processing functions, operations and values can be readily applied to data within each level without regard to the level spacing or output levels. Via this arrangement, the adapter can be assembled with a plug and can be assembled with other adapters of different specifications and types, thereby providing more functionality. A layer of silicone is then applied to the leather surface, the silicone penetrating into the material to a predetermined depth, and the resultant assembly is then operated on in a manner to form raised portions and wells in the top and bottom surface of the assembly.

1459828381-86494c37-13f9-4846-a04c-46042850880a

A semiconductor package has an insulative layer having at least one channel formed on a first surface thereof. The base substrate has a plurality of first regions met to be punched out, and second regions between those first regions. A plate defines a feature sized for operably supporting the workpiece. The protective material such as photoresist or metal layer is filled into the depression portions above the fuses for temporary protection of the fuses during bumping. But on each step CGM determines the area of simultaneous objective functions improvement and a direction

for the next step in this area.

1459828381-b18e9a8c-27d8-4649-b575-a75ec847d898

An instrument for removal of an object, e. Upon receiving entry a purported PIN, a purported shared secret is dynamically synthesized on the device by the OTP application based on the purported PIN of the user and a purported OTP value is generated based on the purported shared secret. A circumferential conductive metal line is provided in the plane of each element at an outer perimeter thereof. The control unit calculate a recent weight estimate and determines whether the recent weight estimate is different from the baseline weight by more than a weight threshold. The protrusions provide cushioning by bending when a foot presses down upon them. If a setting has been made not to output any background object, a page having no foreground object is handled as a blank page, thereby suppressing transmission.

1459828381-f6bd98d8-bf02-4306-80d0-f193008ad6c3

A clamping element for attaching a gripper onto a clamping tongue as well as a gripper with this kind of clamping element is provided. The 3D kernel allows for designs that do not require Wavelength Dependent Waveplates for managing light polarizations within the 3D kernel. In this manner, the high-voltage diode is inexpensive to manufacture. A second electrically conductive pathway is provided leading from the lamp receiving portion to a second of the electrical contacts. The irrigation system also includes a linkage for coupling the span of overhead irrigation equipment with the ground-based platform.

1459828382-07a97c27-5ea6-4790-8492-9577259afbf9

A method is disclosed for creating itineraries for a party of visitors to a facility, the facility having multiple attractions. The lighting device is powered by a battery provided with solar charging. The exterior panel has an eighteen inch long, and a thirty inch long leg. An elastic reaction element is arranged in a control housing recess and against which the output member bears. The flashing may be attached to the interior of the window with hooks and loops which run horizontally across the window and prevent water that splashes under the window from entering into the passenger area.

1459828382-5d8f4272-a804-4800-81bd-2be900db88ce

An implantable electrical connector system, which may be used as part of an electrical lead, a connector block on an implantable pulse generator, or the connector of a lead extension. The LO generator can be used over a wide operating frequency range. The plug connector is attached to a first end of the cable, thereby connectorizing at least one optical waveguide. The conferencing appliance can integrate the differing modalities from the at least two devices by executing at least one of turn taking, conference identification, participant identification, ordering of interjections, modulation of meaning, expectation of shared awareness, floor domination and combination thereof.

1459828382-c210d4d6-3357-4ea1-9640-fcda863e9e73

The present invention relates to a processing method for processing a substrate, and comprises a step of coating a coating solution on a surface of the substrate while relatively moving a coating solution discharge nozzle and the substrate and discharging the coating solution from the nozzle onto the substrate. In some implementations, a customer may replace the asset with another asset in the pool, where the replacement asset imposes a reduced obligation on the debtor. Memory stacks can be formed by adding additional layers\respective layers separated by additional partitioning components, wherein multiple stacks can be formed in parallel to provide a high-density memory device. The fingerprint scanning module includes a touch sensor for sensing different touches that represent different command signals. The retainer has a plurality of radial teeth angularly oriented to engage a pipe and prevent its removal from the coupling.

1459828383-3f2eeb73-dc31-4c90-92aa-dacfd0be0993

Resonators 4 and 5 are able to oscillate horizontally and vertically to substrate 1. The signal protocol is used by link controllers configured to generate, transmit, and receive packets forming the communications protocol, and to form digital data into one or more types of data packets, with at least one residing in the host device and being coupled to the client through the communications path. The road segments collectively represent one or more possible travel routes from a start point to an end point. A pattern inspection method using the image correction technique is also disclosed. The deforming area adjoining the piston stroke area is provided in the form of part that exists as a single piece with the housing. Moreover, intervention of a second understeer control, in which the control amount is lower than in the first understeer control, is carried out when the actual yaw rate does not make a predetermined change with respect to a change of a steering wheel angle, thus improving the sense of stability and the controllability felt by the driver.

1459828383-81defde2-e1a8-432f-9691-affe126cffd6

A bracket-antenna assembly for transmitting and receiving electromagnetic waves as well as supporting a liquid crystal display of an electronic device is disclosed. The method comprises: performing a linear transformation on a measured signal comprising a source component and a noise component; determining a modulus of the linear transformed signal; estimating a noise-free part of the linear transformed signal; and reconstructing the source component of the measured signal using the noise-free part of the linear transformed signal. The sheet mounting part includes first and second members arranged next to each other. The second layered part includes at least the internal electrodes, each being divided in half in a third direction orthogonal to the first direction and the second direction.

1459828383-b1ed6217-0356-41bc-b994-7faa4e204dc6

Disclosed is a zoom lens system which uses a diffractive optical element such that high optical performance can be obtained over the overall power variation range. The control system uses the computed motor model to produce a closed-loop control design that achieves a particular resolution. Moreover, the system may modify the video image so that a product of the intensity setting and a transmittance associated with the modified video image approximately equals a product of a previous intensity setting and a transmittance associated with the video image. It is preferable that in a first mode with the first and second pair of speakers in an unstacked configuration, the signals do not pass through the arrangement of electronic components prior to output. A further feature of the invention allows a variable resolution image to be converted to a fixed resolution image.

1459828384-0ee0cfa6-ef53-4786-9919-edf7135fb353

Included in the present invention are methods of inhibiting sperm capacitation, inhibiting the phosphorylation of a protein at tyrosine residues, inhibiting an acrosomal reaction, and inhibiting fertilization of an egg by sperm with the administration of a CRISP polypeptide. It is desirable to mark a stringer for the uniform equal spacing of the location for the treadrisers and to establish the pivot positions for mounting the supports on the stringer. A first N-channel transistor is connected between an N-channel transistor constituting the prebuffer circuit and the ground potential supply node. It is not always wanted, advantageous or even possible to employ the SyncML coding/decoding feature, since it is subjected to several disadvantages. The relief zone may be radially outward from the sealing portion.

1459828384-5c0e1669-4fda-4cc5-a977-a90d036f2e7e

The present invention has as its objective to provide a display panel with silver electrodes without yellowing, and a method of production such a display panel. A lift member is moveably coupled to the head member. The mirror bracket includes a

mirror receptacle formed as a single piece with the bridge portion opposite the tunnel. Thereby, guaranteeing delivery of requests in spite of lack of resources availability. At least the interfacing surface of the layer made of mechanically stronger materials is provided with protruding elements that remain inseparably adhering to the interfacing surface of the other layer.

1459828384-c708e2ae-a24d-4110-8fbe-f92f0404bf5e

A method and apparatus in a data processing system for updating a buffer containing display information used to display pixels from a first layer and a second layer on a display in the data processing system. The fault correlation software includes rules that monitor a number of indicators that, if occurring together over a window of time, are known to cause or reflect the occurrence of a fault. Techniques include modifying a buffer size for access to trick plays and/or constructing a manifest file with limited content based on ad breaks.

1459828385-67c5534e-6e15-4c32-a688-3f5be6f6931d

Apparatus and method are provided for treatment of a bifurcation of a body lumen. A barrier anodic oxide is formed between the gate electrode and the porous anodic oxide and on the gate electrode using a relatively high voltage. In one embodiment, the wale is of unitary construction and the plurality of connecting walls includes top and bottom walls which form a single chamber between the back and front walls. The STC code mappings are chosen in accordance with one or more principles. At least one of the parts includes two ribs in a chevron configuration and at least one other part includes two grooves in a chevron configuration, the ribs and the grooves being complementary in shape and of corresponding dimensions. A detection method that is based on correlation of multiplexed noise sequences with a noise sequence embedded in the audio is also described.

1459828385-8d4f4006-a97a-4904-a5f7-e257352aaff0

A paging apparatus and method in a mobile communication system providing an MBMS. Specifically, VccVDL is regulated to be higher when the delay through the VDL is relatively small edge of the VDL) and is reduced when the delay is relatively high edge of the VDL). 65 mass % of a free type triterpene alcohol and 0. The method further has the steps of cooling the stretched first end and fitting a skin on the first end. An elastic band attached to the body extends at least partially about the opening to reduce a size of said opening and is attached to the body by stitching.

1459828385-ab498a18-d8b6-4e6b-b793-53f0ff72b3e1

Described herein are embodiments of microgrid systems which may be used as stand-alone systems or may be connected to a larger, integrated power supply system. The method involves cryogenic cooling of the cutting tool during a cutting operation, which cooling results in enhanced wear resistance and fracture resistance of the cutting tool. A stabilizing structure forms walls perpendicular to the smooth playing surface to provide a playing structure. This information could be used to turn on the appropriate switches that best match a set point for a light level in the area.

1459828385-adab8379-a9fa-4294-860f-211e88e01284

Described herein are intermediate compounds and derivatives thereof that can be synthesized during the preparation of 2,4,5-trifluorophenylacetic acid and derivatives thereof. Specifically, the invention relates to an enteral feeding device comprising expandable means which prevents or significantly reduces aspirations from the alimentary tract to the respiratory system. The second portion includes a second panel having a plurality of third embedding elements and a plurality of fourth embedding elements embedded with each other, and the second portion includes a plurality of first embedding elements and a plurality of second embedding elements, such that the first panel can be pushed to form a gap for replacing the second panel.

1459828386-ea2988a0-2923-4a91-9015-87dcbea01446

The present invention relates to a modular door having at least one door panel, premanufactured stiles and at least two rails, and is held together using rods optionally having at least one stabilizer; a modular door kit containing said components; and a method of assembling a modular door having said components without requiring adhesives or any extra fasteners. A stream of waste material and vitrifiable material are mixed and melted in the vessel for vitrification. A projectile release mechanism controls the timing, locations, and numbers of projectiles released per rotation of the at least one rotating member. A method of preparing the material is also disclosed.

1459828386-ff48a552-2477-4b2a-94f3-e4b7152e9c59

A semiconductor integrated circuit has a memory which can enter active state or standby state, and the memory has voltage generation circuits for bit lines and source lines with which memory cells are connected. A stator includes first and second magnetic pole portion assemblies disposed on both sides of the permanent magnet array in the perpendicular direction and each including magnetic pole portions facing the magnetic pole surfaces, and a single phase winding that excites the magnetic pole portions forming the first and second magnetic pole portion assemblies. A substitute cartridge is determined based on the transmitted information, and liquid ejection data for the substitute cartridge is generated. A scraper blade may push the row of product into the forming cylinder through the window thereby compacting the scrapings into a shaped solid body.

1459828387-086af67e-76fa-42ba-bdb2-e03357c1f329

An alternator and starter tester system is provided that includes a protective hood or cover, a controller connecting an LCD touch-screen, an alternator main harness connector, a starter harness self-test connector, a barcode connector, USB host and USB function connectors, an Ethernet connector, and a compact flash connector. An embodiment of the instrument includes handle portions that are pivotable relative to each other and biased apart, and arm portions pivotable relative to each other and to the handle portions. The electrical components are arranged symmetrically and concentrically about an axis. Fabrication processes and systems and light management, such as beam steering, epoxy scaffolds, spectral adjustments, mode matching, thermal expansion control, alignment technology, etc.

1459828387-a3e37cc3-e681-4c72-bd08-3428f74c7c3d

A semiconductor arrangement includes a well region and a first region disposed within the well region. If a crash is detected by the crash detection portion, a data recording/retaining process relevant to the crash is performed by the recording process portion. It uses service-oriented and event-driven concepts and methods to design and implement a new grid-based image communication and management system to solve the problems encountered in distributing archived image information, coordinating work and managing in a virtually centralized way of different PACS or archiving systems under varied operating environments. The method further comprises applying at least one shift to at least one initial design feature and deriving therefrom an altered design so as to compensate for shadowing effects when irradiating the substrate using a lithographic mask corresponding to the altered design in the predetermined irradiation configuration.

1459828387-aa58da18-b825-4df9-ba6a-7ddbc54bbf82

Disclosed is a poly BCF carpet modified cross-section yarn having an modification ratio and a arm angle within a specific range and a Y-shaped cross-section, and a method for preparing it. The structure has or develops a capillary effect at which the quotient from capillary work and adhesion work is larger 1. The mirroring engine compares data in the write request with corresponding data stored in memory. 01 \u03bcm to 200 \u03bcm, and an aspect that the biodegradable resin is polylactic acid. The settlement entity is interfaced with the billing accumulator, and

includes settlement logic for converting each stored dispatch call data record to a billing record for each of at least two of the dispatch networks. The method writes an object information block to the information storage medium, where that object information block comprises the first sequence number, the first blockid, and the second blockid.

1459828387-b3c6037a-ad04-4800-bc02-d8e8b2510ace

Proxy functionality is described for receiving a request for markup content from a receiving device, retrieving the markup content, converting the markup content to code-bearing content, and transferring the code-bearing content to the receiving device. The host mail server provides pages which can be rendered by a browser to present an email service to a user. In another embodiment, upon failure to read a symbol in one of the first and second images, these digital images are analyzed in real-time, and based on the results of this real-time image analysis, the energy level of the illumination is adjusted during subsequent image frames. The static eccentricity sensor is adapted to measure static eccentricity associated with the rotary body.

1459828387-d0f9e634-5ea6-4d8d-8e36-34ef2410811a

A glass composition consisting essentially of, based on mole percent, 46-56% B2O3, 0. The network includes a cell and a plurality of other cells. The supporting unit is connected to the barbecue grill assembly. The outer barrel has a central bore and the inner barrel is removably seated within the housing central bore.

1459828388-2f1a071d-d334-482f-9cb1-2e8112f4f6a3

The present invention relates to 2-amino-2-alkyl-4 hexenoic and hexynoic acid derivatives and their use in therapy, in particular their use as nitric oxide synthase inhibitors. The packet generator is operable to generate a packet for transmission to a destination device. A sheet path of a first unit is linked to that of a second unit by a linking device and a control mechanism is included that sends to the device and discharges a sheet stopped carrying from the path of the first unit to that of the second unit.

1459828388-8ade81d9-4a96-4ead-9d3e-0bbf1b65530b

The invention pertains to a new route to prepare  $\alpha$ -functionalized carboxylic acid esters in a one-pot reaction, by reacting an olefinic acid ester in the presence of a catalyst system, comprising a Rh-complex, together with an aryl boron or a diamine as nucleophilic compounds, and under oxygen-free conditions and elevated temperatures. The first peer-to-peer station is a nearest available peer-to-peer station on the network to the first mobile platform. The enclosure includes a plurality of projections, preferably in the form of spaced apart, vertically extending pins, extending from one or more interior walls of the enclosure. The artificial neural network may further be trained and include a plurality of weights and biases is also shown.

1459828388-e3f2e59d-b3eb-44ff-a9a6-a4af17793302

Embodiments of the invention may include a scanning device to scan three dimensional objects. It identified interference as an essential factor that couples multiple access and routing decisions through the trade-off between MAC throughput and path length. A second body within the housing comprises an anodic corrosion inhibitor. The use of MBE to grow buffer layers allows a range of substrates to be used for CMT growth. A one-handed actuation device is connected to the proximal end of the body and is operatively connected to the connector through the body. Steps of the sequence can include ceasing operation of augers of compactor apparatus located in the cotton receiver are turned off, and moving the compactor apparatus downwardly within a cotton receiver of the machine and against cotton accumulated in the lower region of the receiver, one or more times, for further and better compacting the cotton.

1459828388-ea30c694-a64c-43f0-9af7-09c8a933768b

According to an aspect, a device includes a touch screen display and a controller. A part of each of the main pole permanent magnets on a side on which the magnetic field is generated is replaced by a soft magnetic member, and a relation between a length A of the soft magnetic member on the side of the generated field along a moving direction and a length B of each main pole permanent magnet on a side of a back yoke along the moving direction is  $A \leq B$ . Thereafter, transmission input torque values are measured on a sample powertrain operating at a plurality of different combinations of the measurable characteristics.

1459828389-34431596-27d7-44e2-a747-7e158d031182

An axial flow fan has a hub with a plurality of hub struts extending radially from the hub for mounting a blade on the end of each hub strut. The methods involve treating the subchondral bone, while preserving, as much as possible, the joint's articular and cartilage surface. The element dimension calculating unit calculates production error data of the pattern according to measurement data and the mask design data to transmit the error data to the order-sender via the communication line. Preferably, the reticle masking device is a liquid crystal display. The restructuring composition comprises safe and effective amounts of carrageenans, borage seed oil, squalane, ceramide 3, ceramide 6, red algae extract, dipalmitoyl hydroxyproline and oleuropein, while maintaining their optimum stability.  $xH_2O$ , wherein M is at least one metal ion; n is 3 or 4; A is an organic or inorganic ion; p is 1, 2 or 3; and x is equal to or greater than 0; with the proviso that when n is 3, then a, b and c each comprise a rational number as follows:  $0 \leq a \leq 1$ .

1459828389-5334a9fc-1f01-46d5-bb22-d7a0a667d854

A computer implemented method is provided for computing a two-way optical flow between a reference frame and one or more associated frames in an optical flow module. In a four-mask process, the conventional storage capacitor of the TFT array substrate includes the capacitor electrodes and the insulation layer and semiconductor layer as a dielectric layer. Workpiece graspers grasp a workpiece. These methods may be employed individually or in combinations in an external or implantable ESS therapy delivery device. Determining of the aggregate value may comprise identifying within a range of network addresses represented by the aggregate value respective addresses for which the routing device does not have reachability information.

1459828390-a746b254-d804-45b3-b03a-20c89f8589ad

A method of fabricating an electronic chip on a wafer in which a first mask at a predetermined lower resolution is developed on the wafer and then etched under a first set of conditions for a predetermined period to achieve a mask that is below the resolution limit of current lithography. A method of patterning a layer to be patterned includes providing the above described hard mask layer stack on the layer to be patterned and patterning the silicon hard mask layer in accordance with a pattern to be formed in the layer that has to be patterned. By appropriate choice of components, the non-linear transfer function can be used to accurately approximate any monotonic function such as a square root transfer function. Methods associated with use of the electrokinetic pump and fluid delivery system are also covered. The device may further have a plurality of authentication methods based on the activities on the device. The apparatus and methods embodied in the present invention are particularly useful for high-throughput and low-cost single-molecular analysis.

1459828390-c9cebf63-0aa2-4979-bd0b-b736ea28a766

An ion beam implanter includes an ion beam source for generating an ion beam moving along a beam line and a vacuum or implantation chamber wherein a workpiece is positioned to intersect the ion beam for ion implantation of a surface of the workpiece by the ion beam. In one example, the securing substance is a conductive epoxy. This invention also relates to methods for producing a maize plant

containing in its genetic material one or more transgenes and to the transgenic maize plants produced by that method. The electronic user interface may include inputs to select water temperature, water flow rates, water flow patterns, and/or task based presets.

1459828390-f9c2a7f0-1df5-4abd-a39b-fb0b1a43dab9

Assemblies that can be disposed in a subterranean bore and that can facilitate branch wellbore creation are described. A right bite pad assembly is slidably connected to and completely encloses the right aft end portion of the buccal strap. Conversion is able to be between any of z-scanning indices, raster-scanning indices and representations.

1459828391-163b23e0-7bff-4117-92bb-b273d372c933

A balanced brake control system is provided for use in aircraft. This temperature control may vary at different spatial regions of a showerhead assembly. The capacitor system includes one or more capacitors. Further, it is also possible to obtain the ultrasonic transducer which shows a narrow range of characteristic variations, and is stable due to the high homogeneity of the dry gel. The slave latch may be coupled to the master latch. A disclosed example method involves first and second display portions by a demarcation line, to display first and second content in those display portions, based on receiving an input corresponding to a display coordinate.

1459828391-2344058f-010a-4170-a939-4d8d31e4737f

There is provided a printer management method in a computer system of the present invention, which controls a plurality of printers connected to a network, including acquiring information related to an elapsed time from the time when each printer made a transition to the power save mode, and selecting a printer based on the acquired information related to the elapsed time. The method comprises detecting a plurality of pressure inputs using a plurality of sensors, determining an angle of pressure applied to a stylus device from the plurality of pressure inputs, and transmitting the angle of pressure to an interactive device. The user enters information concerning the presentation broadcast while within the presentation design application program, which is then automatically inserted into a meeting request message automatically sent to a list of prospective attendees of the presentation broadcast that the user has identified. The encrypted IP packet is encapsulated with the IP address of the VPN server and sent to the VPN server. The geometry of the voxels is adapted to the shape of the ultrasound focus.

1459828391-43606bd7-d9f1-4b4d-aa4e-8777a1086f90

Methods and apparatus, including computer program products, implementing and using techniques for computing motion vectors in a digital video sequence are disclosed. The storage capacitor element includes a storage capacitor line, an insulating film formed on the storage capacitor line, and two or more storage capacitor electrodes opposed to the storage capacitor line with the insulating film interposed therebetween. The at least one ingress controller has a time-clock.

1459828391-b0d51e9a-335b-4212-a94e-868a9c3d5af6

A handheld electronic device includes a housing, a display screen and a keypad assembly. The current supplied is controlled to supply all of the LED with a current of a low level to illuminate an object in a shooting mode with light for illumination. The sliding plate is slidably assembled with the base plate and located upon the base plate. Select sections of the rectangular box frame are covered with rigid plating to strengthen the torsional rigidity of the trailer chassis. The present invention also includes at least one pivoting means formed in the elongated main member so that the first end of the elongated main member may be pivotably moved relative to the second end of the elongated main member. More specifically, embodiments of the present invention relate to a pump and signal combiner capable of conveying several kilowatts of pump laser power for kilowatt

class rare-earth doped fiber amplifiers without suffering thermal damage.

1459828392-46aab59b-de3b-4cd4-b0f3-356d6edc07af

A method of forming a cementitious plug in a well is disclosed. One example of the system uses a flexible planar sheet that has a lower surface having a low-tack adhesive and includes a semicircular edge that is used to mask trim next to the bull-nose corner. The security layer material mixture is laminated between two piezoceramic layers, thereby forming a green stack. The element is kept vertical by tension from the self-boosting self-latching mechanism until a forward force such as a boat, jet ski, or car push on the element and the element collapses to a horizontal position. The measuring force during surface configuration measurement can be adjusted by adjusting an alternating signal to be applied to the touch sensor or by reducing the noise added to the detection signal without making modifications to a shape or structure of the touch sensor.

1459828392-837a6da2-bff0-43bc-b70f-da3880104f3e

A heat spreader and a method for manufacturing the heat spreader are disclosed. In some examples, the system encrypts a secondary copy of data after the secondary copy is created. In case the target hydrocarbon is naphthalene, it is possible to prepare naphthalene which has a purity of 99. Preferably the ore treated according to the present invention is ilmenite ore. An indicator is associated with the lever to indicate to the vehicle assembly operator whether or not the sunroof panel needs vertical adjustment relative to the roof panel to obtain an acceptable degree of flushness.

1459828392-a5555f51-1122-41ab-ab00-fce4d3ccdb51

A girt assembly for releasably connecting an evacuation slide to an aircraft includes superimposed flexible panels that are continuous at a pair of spaced connection points for connection with the aircraft. Sequencing uses operational data obtained from airlines and then provides a methodology for sharing this data with the air traffic control agency. The return electrode is disposed on the bottom side of the backing layer and is adapted to connect to a current generator. Then the adhesive agent is applied into the holes to fix the liquid-crystal display to the upper and lower brackets. A drive element is associated with and engaging the tension element for causing the tension element to control the tension applied by the elongated member against a patient's body organ or duct.

1459828393-14db6b04-339d-4f07-b5f4-37808aae6725

A driver assistance device to be disposed in a vehicle includes a traffic signal information acquiring section, an intersection distance acquiring section, a target speed calculating section, and an outputting section. A group identifier is retrieved from the received packet. The metathesis catalyst can be a ruthenium carbene complex catalyst. If a user desires to remove the d\xe9cor product, the d\xe9cor product is formulated to be removed by a number of methods including, for example, vacuuming, wet extraction, chemical application, and the like. A fourth valve has a first input connected to the second input of the first pilot valve and an output connected to a third source of pressure lower than pressure in the equalizing reservoir prior to a penalty signal. Further, the processor receives a non-final search result from the corresponding search table.

1459828393-35d9c5ba-6ac5-40e9-ad91-3ae5880e9514

An intervertebral implant having an endplate that can be slidably expanded following its placement in the intervertebral space. The network resources for the call are reserved based on a reservation request. The invention further provides purified leucine zipper and coiled-coil proteins in which the leucine residues have been replaced with 5,5,5-trifluoroleucines, and the modified proteins so produced demonstrate increased thermal and chemical stability compared to their corresponding wild-type natural proteins. Furthermore, a thickness of the insulating layer is locally matched to the voltage difference determined there. A

cover member of the collar includes a wall which defines an aperture sized for receiving the neck of the cathode housing.

1459828393-f2ec1d27-8a52-41b6-a865-5342d7ebc5ac

The present invention provides methods and compositions relating to fusion proteins comprising multimeric soluble TWEAK receptor fragments and an oligomerization domain. The disk drive includes media such as one or more disks, a slider and a head residing on the slider. When the CPU enters a suspend mode and the first controller detects a temperature of the electronic system to be lower than a threshold value through the temperature sensor, the second controller notify the application program to trigger the CPU to enter a hibernation mode, and operation data is moved from the first storage device to the second storage device. A projected area of each of the second light-transmissive apertures is equal to or smaller than that of a corresponding first light-transmissive aperture. When the register allocator does not map the virtual predicates to the same physical register, the predicate copy pseudo-opcode is replaced by an instruction that will perform a predicate copy.

1459828394-5f59d995-c0f2-493f-8fa9-303f14efa156

A quantum key distribution system is provided that makes use of a quantum signal of polarized photons and comprises a QKD device and complimentary QKD apparatus. Heretofore, a bearer service carrying packet switched service traffic in support of an application session is analyzed for identification of different types of services by the application session. When the steering link is in the neutral position, the caster wheel can pivot about the caster axis through a 360 degree pivot range. In response, the server computes a one-time password that is transmitted to the visitor's device. The processing element is also configured to initiate a confirmation sequence to confirm proper receipt of the configuration data at the mobile terminal, and to receive information indicating whether the configuration data was properly received at the mobile terminal.

1459828394-9bc8ca41-4b3c-4b15-9c8c-230581f4ae69

An apparatus and method for modulating a phase of optical beam independent of polarization. The apparatus for automatically opening and shutting the drain valve in the washstand, wherein a drain-pipe is connected to the bottom of a washstand, and the top of the drain-pipe, i. The pitch display includes a fixed pitch reference scale and a pitch indicator. The end plate includes an end plate body and a plurality of selectively removable cable caps for accessing individual cables passing through openings defined by the end plate. A method of use within the column is also disclosed. At least some of the caps upon forming touch at least one adjacent cap to form a conjoined cap at the distal ends of multiple posts.

1459828394-a426ac9c-6f9e-4777-ac24-b99bb87261c6

An insulation baffle for a mobile platform. A main case covers a plurality of operators so as to allow the operators to be operated. The closure hook is connected to the actuating element by a freewheeling coupling.

1459828394-fbb0df73-a811-41f5-a99c-06128362e22c

One inventive aspect relates to a low back type loop type coil part which may facilitate confirmation of quality of soldering. The rules contain a header describing an initial data structure and a final data structure, thereby defining each of the defined SQL scripts as a section of the updating process. The syringe has a vent that allows air to escape from the receptacle as blood flows therein.

1459828395-54642425-0385-4461-ac93-b32204c91179

A bearing having a high thrust rigidity, an excellent vibration resistance, and a simple structure, as well as a spindle motor using such a bearing are provided. The piezoelectric device is configured for exerting a radial inward or outward force to the deformable lens so as to deform the deformable lens, thereby changing a focal

length thereof. The leakage dams are closely adjacent the vane tips and discourage exhaust gas from leaking in a generally radial direction past the vane tips as the piston just begins to open from its fully closed position. An output is generated indicating whether the data violates any of the rules, thereby providing information regarding the validity of the data being captured. The second entity can communicate the completed task directly to the second datastore, which in turn may populate the first datastore inventory with the completed task. A proximity sensor detects whether an object is supported on the air cells, and a control unit connected to the pump and the proximity sensor controls operation of the pump based on a signal from the proximity sensor.

1459828395-57c9cd33-066c-4d64-95fb-c64a2fe695f9

A highly reliable optical communications equipment is offered, which can control light more accurately than heretofore and which is equipped with a latching function. Each projecting portion is constituted of a stepped portion formed by extending from the shoulder mouth side end portion of each flange to the shoulder mouth side, and a downward slope formed from the stepped portion up to a top face of the lower plate. These antitoxins are produced in avian species using soluble recombinant C. The device of the invention comprises electronic circuitry which is operative to perform the method of the invention. When subjected to pressure changes, the tubular member adapts and expands or retracts from a neutral position. Also, in causing the authentication apparatus 300 to register the discernment information of the user, the discernment information is caused to be input, this discernment information is collated with the discernment information registered in a key information management center 200, and in a case where it coincided, the authentication apparatus 300 is caused to register the discernment information.

1459828395-da340ce3-ccd8-4ccb-8490-df200368d613

A plastic container with a rim and a lid, the rim and lid each having channels which, upon installation, produce a liquid-tight fit by means of three complementary pairs of projections from the walls of the channels. The shelf assembly includes a pair of brackets, a fixed shelf mounted to the pair of brackets, and a movable shelf. The footwell region is bounded laterally and at the top by a panel arrangement of lightweight construction which, together with the floor and the end wall, forms a supporting box for the front-end structure. The comparator compares the voltage of the first input terminal with the voltage of the second input terminal and outputs a comparison result. The golf club head comprises one or more adjustable features such as weight bars, weight screws, weight cartridges, and adjustable sole members, and preferably includes structural features such as pegs, teeth, and polymeric dampeners that serve to preload the one or more adjustable features on the golf club head and prevent or reduce unwanted vibrations when the golf club head is in use.

1459828396-0943be55-2fb5-441b-97e0-3caf413edea7

A driving method of a plasma display panel is provided in which effective resolution and luminance in a display of fields that constitute a frame are improved. The mounting portion and the pressing portion include a lower die contact portion and an upper die contact portion each formed into a shape along the bent shape of the bent material to come in contact with the bent material. Then, a dielectric layer is produced, and the metal track stack for the second electrode is then applied to the dielectric layer. Finally, gain equalization of the optical transmission line is performed so as to obtain a gain remaining substantially unchanged with wavelength ). The heat pipe coupling with a heat source transfers heat generated by the heat source to the heat dissipation fins.

1459828396-41c26b23-fdb9-4101-b692-107247eaff34

A coffee brewing basket for use with a pre-measured coffee filter packet is shown having a first compartment for retaining the coffee filter packet and a second compartment situated below the first compartment for providing an initial wetting

of the coffee filter packet. It includes a negative pressure system to supply a negative pressure which acts on the liquid in the liquid reservoir while no liquid is being dispensed. Write enable circuitry is responsive to an access request specifying an n-bit address to issue a write control signal to the storage element addressed by the access request in the event that the access request is a write access request. A phase detector compares the timing of a signal generated by the phase interpolator to the timing of a reference clock signal applied to the delay line to determine the selected delay stage and a phase interpolation value. By using different packaging methods, the flexible dilute explosive device can be made to have a fixed explosive density, or a field tailored explosive density using a variable volume housing.

1459828396-6367a82b-bd30-4406-87af-515d2ff2b47d

A method of increasing the useful life of heating elements that consist essentially of molybdenum silicide and alloys thereof, wherein the heating elements operate at high temperatures in heat treatment processes and generally rest against the floor and/or the ceiling of a furnace. The disclosed systems and methods may include receiving, at a delivery processor, origin data corresponding to an origin delivery office that receives an item to be sent, the origin data comprising origin location information, a scan date reflecting a date the item is scanned at the origin delivery office, and a scan time reflecting a time the item is scanned at the origin delivery office. The precursor can include a polymer or plastic loaded with a laser-marking additive in an amount of or greater than about 1 wt. A second direct contact condenser can be included in the lower section of an absorber that removes acid gas from a feed gas. The possibility of logical connection via a physical path connecting the first free port and second free port is controlled.

1459828397-60fbc10c-56a4-41c8-b7a9-0297ac5b4805

A method and data structure for creating and accessing folders stored in well known locations. The structure includes a heat-dissipating body and a heat pipe. The ceramic carbon composite material can be produced by forming a green body from ceramic-coated powder in which the surfaces of carbon particles of or containing graphite are coated with individual ceramic layers and sintering the green body. Further, the archived data can be destroyed according to destruction indications.

1459828397-872a7704-44be-45f5-9a75-3d375c3425aa

A device and a method control the operation of an electronic wheel unit that is allocated to a vehicle wheel. When executing an object, a retrieval request, which includes the object name of the object, is sent to a computer for providing the naming service. At least one magnet is affixed to the instrument to facilitate the mounting thereof on a ferrous workpiece. The sealing cap is provided for a sealing region to cover the light emitting section such that ends of the sealing cap does not reach the ends of the transparent substrate or the wiring line terminal section of the transparent substrate. The gas introducing pipe is configured and arranged to introduce purge gas into the space inside the air induction pipe at a position between the throttle valve and the partitioning part.

1459828397-b7ea4688-07d1-4b4d-8b0c-e61f773881b7

A hybrid construction machine includes a control valve provided in a flow passage that connects an actuator to a regenerative hydraulic motor, an opening of which is controlled by a pilot pressure led to a pilot chamber thereof; and a solenoid pilot control valve that leads a pressure on an upstream side of the control valve to the pilot chamber. In the character string input apparatus, a character string to be input as a portion following a character string input by a user is predicted based on the character string input by the user, and the character string input by the user is completed using the predicted character string as a portion complementary thereto. Each one of the logic sections is fed a corresponding one of a plurality of request signals for the common resource. If the selected elevator car belongs to the FREE group, the car is allocated to the EXP operating group while taking

account of certain parameters.

1459828397-c308799b-3490-4944-9e67-4d051a063e5b

A border gateway protocol management system dynamically determines an optimum or preferred data route from wireline networks into a satellite communication system. The device is first processed in a known manner, up to and including the deposition and anneal of the bit line metal, using a higher dielectric constant material that can withstand the higher temperature process steps as the insulator between the bit lines. An active tag has a memory for storing data representing a vending event, for example the date and time of the event. The external resistor limits current flowing through the first power transistor, thereby limiting temperature rise of the first power transistor.

1459828398-c67e8291-84af-48dd-9d07-77eed8f1d090

Embodiments of the present invention are directed to current driver circuits and methods for driving a load. In addition, the invention provides a virtual representation of a GDF receptor or a functional peptide portion thereof. Preferably the calibration target pattern is pre-distorted and includes at least two sinusoids that create a pattern of distorted wavefronts that when imaged by the camera system will appear substantially linearized. Various forms of devices for grasping are possible as alternatives, including a string, a tab and a tab with one or more finger-receiving holes. Offset compensation may also be implemented using an autozeroing comparator section without a preceding amplifier section.

1459828398-eda89b32-d4b9-420b-83db-3eb78e1596ab

Embodiments of the present invention generally relate to a golf putter and methods of using the same. The memory element provides arbitrary levels of redundancy, allowing the tolerance of multiple single event upsets due to particle hits. The method also includes identifying an expiration time corresponding to the given inventory item and, in response to the expiration time being shorter than the breakeven holding time, calculating a second quantity of the inventory item, where a difference between the second and first quantities represents an additional quantity of the inventory item to be removed from the inventory. The circuit board has a through hole. The first section is located below a mother board and the second section sits on a top surface of the motherboard when the centrifugal blower is mounted to the mother board.

1459828399-02f75447-0744-4006-a0b2-7aadfd5aa9d8

Speed limiter system to detect over speed and generate a signal to cut the power and if necessary operate brakes. The power manager is connected to control the operating power flowing to various pieces of computer network equipment at a single site. The vehicle utilizes the cryptographic key obtained from the certification authority in cryptographic communication with the prospective component, and determines whether the prospective component is the authentic component based on whether the cryptographic key is successfully utilized in the cryptographic communication. A locating portion protrudes at an inside of the clipping board and abuts against an end of a rear surface of the prop body. An aircraft can be equipped with such a device.

1459828399-3ccc5ab1-6231-4d77-8ec3-fa6eb0153933

A thermal-type fluid flow sensor technology for measuring more precisely the temperature of the heater for an improved sensibility of detecting flow measurements. The information processor of the control system executes a POST operation and a starting operation, and instructs execution of a POST operation to the information processor of the standby system after completion of the starting operation. The measuring unit is equipped with a monitoring device for triggering an alarm device when a predetermined limit value is exceeded or the loop current is interrupted. The method is relatively simple and inexpensive and provides reversible hydride compounds which are free of the usual contamination introduced

by prior art wet chemical methods. The supporting means includes arms that extend from the electric motor unit. Preferably, the third operating voltage is generated such that the first operating voltage is increased to a fourth operating voltage by a voltage-up converter, and then the fourth operating voltage is dropped to the third operating voltage by a voltage down-converter.

1459828399-655c8e92-5503-451e-bad3-dcc7aaebdaea

A target for practicing aiming sport or game projectiles, such as balls, hockey pucks, arrows, etc. Novel technologies to realize improvements in low power consumption, low noise, and analog output path which occupies minimal die area while maintaining certain data rates are disclosed. The telephone initiates the synchronization by placing a data call to the server and logging on to the server. Additionally, the hydrostatic system has both hydrostatic motors having the same rotary speed but moving in the opposite direction.

1459828399-bb829156-bc95-4a9b-91b4-e674aaf72cfd

A steerable multi-linked device. In this invention, an image is segmented into a predetermined number of blocks, and attributes are discriminated in units of blocks. A multitude of spatially resolved spectra of transmitted, reflected, emitted or scattered near infrared wavelength radiation light from the illuminated area of the sample is collected and a collimated beam is produced therefrom.

1459828400-3163148a-108d-4430-8d27-6ec173fa8b16

The present invention relates to a fixing apparatus which radiates rays to a detection object and which detects the rays returned from the detection object to obtain a temperature signal. A first portion of the metal layer is formed in a first deposition chamber, the first thickness being approximately half the target thickness. The first processing module is used for generating a lightness histogram with reference to the input image and determining a maximum lightness and an average lightness according to the lightness histogram.

1459828400-3a760811-77a5-49e6-85aa-214c50048bd8

A method for providing data integrity of a database system. An airbag cushion which is deployed by deploying pressure of an inflator is mounted between an inner side panel so as to stably deploy toward a cabin through a portion where a head lining and a pillar trim are matched. The result is that the passenger in the middle seat can look directly along lines of sight S at the passengers in the outer seats of the next row and vice versa, which they would prefer not to be able to do. Various methods for improving fault isolation and fault reduction are also provided. The image on the screen is optically transmitted in the form of a plurality of blocks to the image display plane and a block deflecting system associated with the display plane receives the plurality of optically transmitted blocks and displays them in the proper order on the image display plane. When an error occurs, each layer of software can add details to the error stack.

1459828400-770e04c5-0477-4ca2-9323-ef87f43eaabb

A rotary, positive displacement pump for fluids, having a pair of diametrically opposed vanes secured to a rotor in equally spaced, similarly contoured pockets, for movement between an extended position with a portion of the vane extending outwardly beyond the cylindrical surface of the rotor and a retracted position wherein the vane is seated entirely within its corresponding pocket. Modulation transfer function differences between the screen film system and the digital receiver are compensated and noise content at frequencies approaching the Nyquist frequency for the digital receiver is suppressed. The states are prioritized in a manner to achieve good performance. A feed stream introduced into the housing is in direct contact with the structures such that a gas selectively permeates through the body and into the channels.

1459828400-a12441ab-399d-48f6-a3a1-d33a75e4d291

The present invention provides a solid golf ball which gives a superior shot feeling to the golfer and exhibits stabilized repulsion performance when it is hit at any head speed. A plurality of keys are located above the intersections and exert force on the conductors and FSR elements during key presses. The vehicle control system further includes a monitoring control device having a control circuit that is different from the by-wire control circuit and that monitors the by-wire system on the basis of monitoring information received from the by-wire system. An adjustment mechanism is also provided for releasably adjusting the distance between the magnets and the elongate strip. In this regard, a representative method includes: receiving information from multiple test systems regarding a first airflow parameter of a gas turbine engine component; and using the information to establish a desired performance parameter that is to be exhibited by a repaired component.

1459828400-bc31086f-b2a8-4f08-beab-abcb7bf9ee9c

An interconnect structure on a substrate is provided. The first and second members define a first and a second chamber for holding the fluid. The stopper includes an inclined portion for supporting the body portion, and a second protrusion extending a support portion thereof.

1459828401-394c961e-e925-4d67-9186-d95582258e7a

A waterfall manufacturing process and apparatus are described for a data storage device. The molecular device comprises a junction formed by a pair of crossed electrodes where a first electrode is crossed by a second electrode at a non-zero angle and at least one connector species including at least one switchable moiety and connecting the pair of crossed electrode in the junction. A front housing of the connector includes a bore for receiving a rear housing, an anti-rotation seat configured to engage the hub, and a cavity coupled to the anti-rotation seat. A seal ring is formed along the edge of each active area. Such a Feedback Control Mechanism is capable of maintaining a condition of non-congestion, a sufficient and necessary condition to meet end-to-end QoS requirements in a Next Generation Network. The first and second parallel portions allow for retention of a picture in a gap formed by the opposing portions.

1459828401-8729490b-2204-499d-b9a1-efd88fbfffc69

Provided herein are novel methysergide derivatives and compositions thereof. The upper portion includes intake ports extending from a top surface thereof. A second glass substrate is anodically bonded to the other side of the SOI substrate, and debonding of the existing anodic bond prevented by eliminating any potential drop across the existing bonded surface.

1459828401-8d20744d-8862-4d41-accb-7687a6ed7369

A portable electronic device includes a base module with a housing defining upper and lower sliding grooves at each of two opposite side walls of the housing, and a system module mounted slidably on the base module through a pair of sliding units. In embodiments, a data packet is received that is part of a communications stream and a dynamically modifiable quality of service indicator is embedded into the data packet wherein, in various embodiments, the DMQOSI indicates a prescribed quality of service that is associated with the data packet and is modifiable prior to completing a communication of the communications stream. The method may further include sending an update flag signal from the call center to the telematics unit.

1459828402-7eef398a-9b92-44b2-a22b-e996aef22895

A sound emission and collection device has a plurality of speakers and a plurality of microphones. The coating system is radiation-cured to at least a reduced tack state before the coated surface contacts the second conveyor. A valve closing timing of the intake valve or a valve closing timing of the exhaust valve that cooperates with the intake valve may be used as parameters to be corrected. And, the second etching is a dry etching for removing the residual silicon nitride

slices formed during the first etching. The DC bus can be adapted to be electrically coupled to a plurality of inverters.

1459828402-936923ba-2a1f-4ed5-8444-dcf18754fe04

An electronic component mounting method by which a surface-mount component and an IC can be efficiently and reliably mounted on a single substrate is provided. The crossbar switch further includes n decoders connected to the n input rows. That way, inconsistency problems called binary incompatibilities are avoided. A check valve is interposed in the motor-side charge fluid passage so as to allow the fluid to flow from the motor-side charge port to one motor-side operation fluid passage while preventing reverse flow. The automated cannula array changeover capability permits automated wellplate reformatting procedures, which can be performed quickly and accurately. And then the output power is supplied from smoothing capacitor 62 to heating coil 59, thereby reducing the pot vibration noise, which is caused by pulsating current of input voltage.

1459828403-4ee444b7-4ba0-444e-bd84-eaf5755a9dbd

A wireless LAN setting system mounted on an image forming apparatus that performs network connection through a wireless LAN and used for performing wireless communication with plural terminals, the wireless LAN setting system including a mode for checking, before setting is performed, existing setting contents presently set. The new plant has a compact habit with stiff, upright, heavily-branched stems showing strong greyed-purple tinting and persistent calyxes of similar greyed-purple tinting, a strong vigorous growth rate and gray-green foliage. The buffer layer may be cleaned by incident light to preserve or improve its hydrophobicity.

1459828403-8ef5d27c-55bf-4f5c-9d1a-196c91d31185

A mechanism for hemming the beltline of a vehicle door panel is combined with a mechanism for hemming the outside perimeter of the door panel, and the two mechanisms are driven by a common drive. A recording opening is formed in the camera housing facing toward a recording direction. The plurality of openings include a first through-hole and a second through-hole, each through-hole passing through the plurality of sacrificial layers and plurality of insulating layers, and the first through-hole and the second through-hole overlap each other in the first direction. Using the tool and the installation head to apply the predetermined axial tensile and compressive forces, captive panel fasteners can be reliably installed using a single tool stroke.

1459828403-a281af0b-ecb9-4003-82d2-d94b9acf59d5

The present invention provides an electronic key system for a vehicle which is a type of starting the engine with pressing a button switch and can be operated at familiar mechanical movements thus easing the user or driver of an unfamiliar conception as well as improved in the operability and the protection against theft. Particular flexibility in use and extended areas of use are achieved in that the robot platform is modular and the communication device operates in accordance with a uniform standard. Further, in the micro-reactor, the receiving member having a mixing channel having an outer periphery in the same form as an outermost periphery of the outer layer channel is provided detachably to the plate.

1459828404-73752675-9b73-4186-997e-2198694d30f4

There is disclosed methods and apparatuses for multi-view video encoding, decoding and display. The control valve has five control edges, with two separate line paths formed to feed the fluid forced out of the small stroke space back with a back-feed control edge and a pressure-release control edge is formed to release pressure from the small stroke space to the tank. Optionally, multiple play participants, each provided with a suitable \u201cwand\u201d and/or other actuation/tracking device, may play and interact together, either within or outside one or more compatible play environments, to achieve desired goals, master certain magical spells and/or produce desired seemingly magical effects within the play environment.

1459828405-17030a6b-ca43-4d3a-8563-ec9ff72621d8

The disclosure is related to systems and methods of management of memory. A reservoir contains a supply of dye that is thermally transferred from the reservoir to the dye donor element by diffusion of dye into the dye donor element. A bus arbiter is provided for arbitrating between requests to access the bus by a first bus master and one or more other bus masters.

1459828405-36829a40-d60a-4fd9-a05a-8e7feddba0d2

The present invention is directed to a crossbow operable for shooting missiles. The test element has a substrate and a microfluidic channel structure, which is enclosed by the substrate and a cover layer. The protrusion is disposed in an area between a center hole and a clamping area where the optical data recording medium is held when reading and/or writing data in the signal recording layer. Thus the principle of an energy see-saw is implemented. Techniques for properly locating the cannula with respect to the target tissue, for protecting non-target tissue, for regulating heat generated by x-ray emitters, and for combining therapies are disclosed. Several variations in contoured faces, including tongue and groove contours, for the mating surfaces provide for a smooth and clean looking skirtfascia board on a finished stairway.

1459828406-2c3f2bbc-6f06-4369-9d73-aa57271a2399

A composite material useful for the manufacture of a circuit has a support layer, a metal foil layer having opposing first and second sides and a thickness of 15 microns or less and a release layer effective to facilitate separation of the metal foil layer from the support layer, the release layer disposed between and contacting both the support layer and the metal foil layer. Even if the phase-locked loop is used to generate the low frequency local-oscillation signal only, a frequency offset and a phase noise taking place in remaining high frequency local-oscillation signals are compensated for or canceled out. Criteria may include a total amount wagered, a total number of handle pulls completed, or a total amount of time spent at a gaming device. , a side surface, which are oriented with respect to each other to define an acute angle. A vent gas pressure regulator is fluidly connected between the vent gas supply line and the mixed gas outlet line.

1459828406-c45030a2-2886-4df0-8255-1d46241e83de

A particular method includes detecting an interaction event using an event capture object of a rendered display of a graphics file. The cosmetic composition includes an aqueous phase, an oil phase comprising a water-in-oil emulsifier, and an oil stabilizing component. The first reflecting device is an ion accelerator which functions as both an accelerating device to provide the initial acceleration to the ions, and a reflecting device to reflect the ions in the subsequent mass analysis.

1459828407-6fb7c69b-a132-41ff-8bfb-bb8fdfd093a6

A furniture module having a support surface and at least three legs extending therefrom. A radiation source supplies EUV radiation having a certain dispersion angle. A protecting member is arranged in the bottom portion and insert molded using a material having an anti-wear resistance characteristic that is superior to that of the resin. Barriers formed on the posts prevent contact of the flexible circuit with the circuit board until the contact fields are properly aligned. A fast scan angle compensation is used by the mobile system of the aircraft to implement another control loop to further adjust the transmit power.

1459828407-b41fd536-191a-4b6c-839d-820a0ef30c68

The invention relates to an application adapted to run on a client apparatus connectable with a server across a network. A filament including a filament bulb and a reflector of a substantially hemispheric shape is arranged in a lower part of the housing. An authentication request for access to the electronic information is sent from the first computing device to a second computing device.

1459828407-d279af9e-5169-44bc-bb2c-69f45392a173

An apparatus includes an extractor, a first subtractor, a second subtractor, a third subtractor, an offset generator and an adder. They are made of a first constituent with high crystallinity and at least one second constituent, compatible with the first constituent, and of crystallinity that is lower than that of the first constituent. At least one of the housing portions supports an electronic tag. Similarly, the upper step surface is adapted to receive a second light-panel so that the second light-panel lies flush against the upper step surface.

1459828408-01cc26f2-eeec-46a4-92d5-0d3fbb958e4b

A process for producing valve metal oxides, such as tantalum pentoxide or niobium pentoxide with a narrow particle size distribution within a desired particle size range, is provided. The base substrate has a filtration efficiency of about 35% to less than 50%, measured in accordance with EN 1822 test procedure A nanofiber layer is deposited on one side of the base substrate. Based on the information provided through the interface, various financial and engineering rules are employed to identify an optimal system configuration and to provide cost and revenue information with regards for that system. A method of applying the sheath to the prongs uses a pair of jaws to drive the sheath onto the prongs. The controller is configured to activate at least one resettable restraint device when one or more of the data signals exceed a first threshold, indicating that the vehicle is in a position or undergoing movement that indicates a potential for vehicle rollover, and to de-activate the at least one resettable restraint device when one or more of the data signals fall below the first threshold. The controller processes the output of the addressable module responsive to the address signal to make a failure diagnosis.

1459828408-319edfc5-6d11-4200-93b2-3b065a48b683

A method for initializing a computing system comprising a plurality of devices which communicate on a communication link comprising a plurality of independent point-to-point links is provided, each of the point-to-point links interconnecting a respective pair of the plurality of devices. The promotional apparatus includes a base and a display panel that is movably secured to the base for rotational movement about an axis between a substantially vertical display position and a substantially vertical non-display position. In a first section, fuel, oxidizer, and possibly water are supplied to the high pressure combustor at a combustion section of a vertical vessel. The filter bends out of the way of a plumber's auger. Each support mechanism is coupled between the support belts and provides stability to the user's body. Thus, it is possible to realize a compact and high-image quality small zoom lens that is suitable for three-CCDs.

1459828408-5bfa7ebb-2ff1-4ee2-927e-9b97aea60002

An electric motor apparatus comprising: a rotor; and a stator formed of at least two stator components, each of the at least two stator components having a substantially hollow cylindrical form. In accordance with the described method, the specimen is moved relative to an imaging system comprising a microscope and camera in a predetermined path while the plurality of magnified images are captured. The nanofiller comprising a surfactant wherein the surfactant has the structure of N+ wherein R1 is benzyl derived unit, which may or may not be substituted, wherein R2 is selected from C1 to C26 alkyls, C2 to C26 alkenes, and C3 to C26 aryls, and wherein R3 and R4 are the same or different and are independently selected from C9 to C26 alkyls, C9 to C26 alkenes, and C9 to C26 aryls. Responsive to  $u_{212}V_{gs}$  conditions on a gate of the protected transistor device, the series coupled isolation diode element prevents a forward biasing of the drain-source junction of the ESD transistor prior to a breakdown condition of the isolation diode element. The colored speckles are comprised of a salt or salt-containing carrier and a coloring agent and are characterized as being substantially uniformly colored throughout the cross-sectional volume of the speckle. In addition to the disclosed

general algorithm for arbitrary coherent noise, a specialized algorithm for random noise is disclosed.

1459828408-94b106ef-a244-431a-b64a-0471ad9b6965

Disclosed is a novel method for synthesizing pyrazolobenzodiazepines of formula I using intermediates of formula Pyrazolobenzodiazepines of formula I are useful in the treatment and control of solid tumors. A calibration function is determined from a relationship between values of an input quantity and values of an operating parameter of the source by applying different values of the input quantity to the source. The plurality of RF) transmit sections is operably coupled to convert the plurality of transmit baseband signal streams and the at least one cyclic-shift delayed transmit baseband signal stream into a plurality of RF signals.

1459828408-ad209579-f6f6-4149-bd45-2f13773c7f8d

A coated article is provided which may be heat treated in certain instances. A region specifying component specifies one or more playing regions for generating predetermined sounds in an image represented by the moving image data that have been acquired by the acquiring component. The p+ implanted regions may be formed before and/or after formation of the collection gates.

1459828409-90962664-0532-4452-a16d-03065b2e74ff

A connector that is configured to be installed on a printed circuit board and electrically connected to an external terminal is provided. A select data track of a storage medium is scanned for a defect. The glass of the present invention can have a soda-lime-silica glass base portion, with major colorants that provide the blue color. This new Raman spectrometer may be used to detect less than 40 ng of ammonium nitrate deposited on the silicon surface with the signal-to-noise ratio better than 50 during 0.

1459828410-b497969b-b5ee-42d0-8e39-a17b473b266e

A data processing system using a client-server configuration includes a method and apparatus for simultaneously generating multiple copies of data sets in multiple storage pools. The method for node recovery according to the present invention makes use of an old version of a fragment in a failed node. Retransmission of the second data block may not be performed until uplink scheduling control information on the second data block is received. Additionally, the install flash program is used to install media stored on a removable storage device onto the internal hard drive. The method further includes transmitting, at an access point, the compressed beacon.

1459828410-cd070f67-b1b4-4cd8-911a-096a7b79f6c7

A playback apparatus includes a storage unit and a processor. The upper piston part has a circumferential ring belt provided with ring grooves, the inner wall of which delimits the circumferential outer cooling channel. Each of said first and second terminal groups comprises at least a base portion and an opening portion thereon. At least two anterior traction slings are provided that extend across an intermediate portion of the bracing rods. The task metadata may be a part of the collaborative task and identifying the collaborative task as a part of a process.

1459828410-da1633c6-2864-4342-9abe-eef68401843c

An assembly for coupling an external optical component to a portable electronic device is disclosed. proprietary inbred maize varieties. This effectively avoids a need for more tedious registration of authorized remote control transmitters in systems where the control device 11 interfaces with a movable barrier operator 12. Methods for producing a maize plant containing in its genetic material one or more traits introgressed into X95A928 through backcross conversion and/or transformation, and to the maize seed, plant and plant part produced thereby. One embodiment of the invention relates to forming an assembly using different sized blocks in either a flexible or rigid substrate. An injection-molded part is injection-molded to an

outer surface of the tube component in an area of the support body.

1459828411-25ca2248-d6cd-481c-9748-7483f95877a3

Aspects of the present invention relate to an apparatus for converting a container into a smart bottle. In accordance with the invention provision is made for the tube hopper to be arranged in the drilling direction above the drill drive and to be connected to the drilling tube. It is then determined whether this cell site assignment results in secondary criteria being exceeded. A prompt measure to a trouble in production is made possible based on the information such as the position of the article. The invention includes cementitious mixtures and hardened concretes resulting from the method and fly ash treated with sacrificial agent, or air entrainment agents sacrificial agent combinations, and processes for selecting suitable sacrificial agents. The traffic shaper also provides very high resolution in terms of bit rate specification.

1459828411-d4c3ea40-73c5-4d3e-bc35-89b6ddcb92b0

Compounds of Formula I are useful for inhibiting serine protease enzymes, such as TFfactor VIIa, factor Xa, thrombin and kallikrein and have improved pharmacokinetic properties. During execution of a graphical program generation program, the GPG program receives program information specifying functionality of the graphical program to be generated. The trans-compression types and capabilities of the first and second gateway devices are determined and used to generate a set of negotiation parameters. The volumetric ratio is between 1:100 and 1:150 for methanol to phosphoric acid, and between 1:100 and 1:150 for ethanol to phosphoric acid. Adjusting the pressure controls the asphericity of curvature.

1459828412-30b798ed-3e91-405c-b6c9-e4cb0361dbf8

The optical image stabilizer includes a first movable part including a first lens having one of positive and negative optical powers, a second movable part including a second lens having the other of the optical powers, and an actuator driving the first and second movable parts in the directions opposite to each other with respect to a supporting member. The retainer includes an interface coupled to the flap and configured to provide an interference with the base and a member coupled to the interface and configured to engage an edge of the base to eliminate the interference when the flap is moved to a closed position. The division of quad regions may be dependent on a maximum number of listings per quad region and a minimum size for any one quad region. Connector contacts are disposed in the connector assembly housing and electrically couple to the electronic subassembly. A color-fill system may be applied over the top fill layer, and one or more layers of a color mix may be applied over the color-fill system. by means of linear regression, from the correction factors of the similar product data records.

1459828412-aeeea759-8099-4c8d-917c-ffed43c06b3d

This invention relates to the reversible protection of hydroxy-silane functional groups by acid cleavable protecting groups. To do this, the signal analyzer observes a pattern of zero crossing slope values of the three line-to-line voltages of the three-phase power system and observes a pattern of zero crossing slope values of the current in the three power lines. Documents or document summaries relevant to the given factoid category is next collected from the text repositories. The device is symmetric so that it may be pulled in either direction.

1459828412-c6110b33-2bd4-43ba-89dc-ceb5c0af792c

A system and method for detecting and reducing mosquito noise are disclosed. Also disclosed is a composition comprising desulfurized, cracked-gasoline wherein the desulfurized cracked-gasoline comprises less than about 1 ppmw thiol compounds and less than about 1 ppmw tetrahydrothiophene compounds. The existing entry after having had its size attribute modified references a consolidated page comprising the existing page and the new page. The compressible layer contacts the booster rocket along most of the length of the booster rocket to distribute applied

pressure, nearly eliminating bending loads.

1459828412-d930f94e-aaed-4bbb-96b1-9a750db3079b

In general techniques are described for allocating global identifiers to forwarding units of a network device. The rocket engine nozzle assembly may then be sealed. In accordance with the invention the current-supply means are so disposed, and the ratchets are so constructed, that current flow from the current-supply means to the electrode components is possible only in the closed position. A master resource object located on the master node grants locks to shadow resource objects located on the nodes on which are located the processes that desire to access the resource. Three angle-adjusting bolts respectively insert through the screw holes to abut against the rounded indentations.

1459828413-05dde7a3-9957-4d90-b736-ce9daab8810e

A photovoltaic device having a crystalline semiconductor and an amorphous semiconductor thin film so that junction characteristics can be upgraded. The invention further provides a preparation method of the red fluorescent material, and an electric light source prepared from the red fluorescent material and a preparation method of the electric light source. Another aspect includes performing a scrub read of an address in the plurality of memory channels.

1459828413-f1b79554-8480-4510-bc95-5a4dd506a18c

A slew rate regulation circuit varies a slew rate of a waveform of a voltage outputted to a DC motor through a N-channel MOSFET. The pharmaceutical composition can be packaged in various tablet forms, including standard tablets and multiple pellet tablets. Through the processes of collecting call detail records and their correlation in representative embodiments, various call \u201clegs\u201d associated with the same call can be identified, and a more accurate \u201ccompound\u201d call record can be made that incorporates call routing information obtained from the individual call legs. The generated and updated CRM data is transmitted to the user's terminal via the communication network such that the CRM data is stored in the user's terminal. A detection means to signal the end of an ongoing CMP cycle. 6 to 12 times the height of the upper blanket zone.

1459828414-06386f49-dd1b-4acd-96b3-a519b420e4fc

There is provided a storing case adapted to be disposed on top of an amplifier, an amplifier head, or an amplifier stack. The first totem pole driver stage includes at least one PMOS pull-up transistor and at least one NMOS pull-down transistor therein that are responsive to a first pull-up signal and a first pull-down signal, respectively. A printhead and ink supply module is contained within the body and includes an elongate printhead integrated circuit which extends transverse to the path. According to another aspect, an IC includes a register corresponding to each partition to support transition fault testing. At the top of the QWIP-LED wafer an optical coupler such as a diffraction grating for coupling at least a portion of incident MFIR light into modes having an electric field component perpendicular to quantum wells of the QWIP is provided.

1459828414-2d20c00c-80c7-44d0-8937-78965530910d

A method of adjusting or locally modifying the direction of magnetization of a ferromagnetic layer in a magnetoresistive layer system using a heat stamp is described, the ferromagnetic layer being stabilized over an antiferromagnetic layer. Disclosed embodiments include a central zone hosting an inventory system. The supports also releasably receive flanges on electrical components for direct mounting of the components.

1459828414-483a0cdf-10b4-4122-9d8d-3b2c23388c22

A nonvolatile semiconductor memory device in which a memory cell life can be prolonged while making it possible to perform writing in units of bits. This invention thus relates to the seeds of soybean variety XB29M08, to the plants of

soybean XB29M08 to plant parts of soybean variety XB29M08 and to methods for producing a soybean plant produced by crossing plants of the soybean variety XB29M08 with another soybean plant, using XB29M08 as either the male or the female parent. During the period where the fuel concentration of purge gas is expected to sharply decrease, the concentration updating base value is increased.

1459828414-d033b123-161f-4816-b558-28bf98068ba0

A method and apparatus for controlling electrospray deposition comprises using electrical variable waveforms from the ESD process as a feedback parameter. The hollow partitions and transverse walls define baking pits within the bays for stacking carbonaceous articles therein. The optical detector is configured to detect the pulse output via an optical port of the electricity meter. An acidic antioxidant for prevention of oxidation of the active, sensitive encapsulant, and a plasticizer which solubilizes the acidic antioxidant are included in the matrix material which encapsulates film-coated oil droplets containing the readily oxidizable component. Information for the selected subpackage, which may include a summary and metadata, is used to determine whether the subpackage satisfies an information need. More specifically, the applicator includes antiseptic solution in amount sufficient to be applied to a desired surface and to have an antimicrobial effect on the desired surface and a porous element.

1459828415-2a85f034-3fe8-4ae7-a685-58e34f94bfba

A grease supply confirming device confirming the supply of a grease into a bearing, according to the present invention includes a detecting member an elastic supporting member and a movable body. More specifically, the present invention relates to an absorbent composition comprising a liquid absorbing material, at least one alkaline earth metal peroxide, and an acidic material. The outer valve has an outer valve body pressed by the male connector and opened in a case where the male connector is inserted into the insertion opening. The presented invention further includes a method of treating or preventing an HIV-1 infection in a mammal in need thereof using the compositions described therein. By thinning the spacer before the epitaxial layer is formed, the present invention could stop the epitaxial layer to grow against the sidewall of the spacer, thereby preventing problem such as Ion degradation. To this end, media separating means is arranged between the nozzlesnozzle rows for applying cooling medium to the rolls and the nozzlesnozzle rows for applying base oil to the rolling stock.

1459828415-50d25e5a-f2bf-4249-8831-a45a03090fc2

A stereoscopic camera module includes two lens modules, a light guide assembly, an image sensor, and a processor. An external bus is shared between external and emulation memories. Voxels contained within the medical image are classified using a spatial constrained fuzzy clustering algorithm. The transformer has a bi-directional magnetic circuit. Finally, a set of characteristics is identified for the set of interest points. Also provided are methods and systems for inactivating Aze in food and byproducts, as well as other methods for the diagnosis, prevention, and treatment of disorders associated with Aze.

1459828415-57b8f047-3b17-4d59-9680-5e332175b597

The present invention provides a compound, system, and method for retrofitting and converting standard bicycle rims and tires having tubes to be tubeless. In an embodiment, the apparatus and method comprises a wiring closet which has power supplying capabilities for providing power to a plurality of conducting pairs. Holes are then subsequently punched between the previously punched holes at intervals A without removing the die punches used to form the previous holes. , N-acetylcysteine, or a leukotriene blocker. The oil pump generates an oil pressure by rotation of the selected one of the engine and the turbine.

1459828415-f832fbe7-25b5-4c1d-8082-dcf0c9bd463e

Methods and systems for contacting a crude feed with one or more catalysts produces

a total product that include a crude product are described. The clutch guide is provided with a support section which supports one axial-direction end section of the coil spring from a side opposite to the clutch cover in an axial direction of the clutch guide. Alarms are transmitted to telephones and beepers. The spring contact is disposed in a mating aperture formed in the substrate. Such methods are capable of removing contamination from the Fischer-Tropsch product stream such that plugging of the catalyst beds of a subsequent hydroprocessing step is substantially reduced. The magnetic material layers are layers of a magnetic material having multiple metal grains constituted by a Fe<sub>2</sub>Si-M soft magnetic alloy and oxide film formed on the surface of the metal grains.

1459828416-57f30220-2bd5-4661-93bb-10c78e8013c9

A glass handling system and method are described herein where an enhanced robot is used to engage and hold a glass sheet in a manner that minimizes the motion of the glass sheet as it is moved from one point to another point in a glass manufacturing facility. The first user equipment may have first capabilities different from second capabilities of the second user equipment. A drive belt engages the drive pulleys for driving either pulley from the other. A third VLAN status message that associates a second VLAN identifier with the first node is then processed, wherein the third VLAN status message was generated in response to a second bind request message that associated the second VLAN identifier with the first node, and whereby the VLAN status of the first node is updated.

1459828416-75af98a1-ae8b-4f88-be92-fe61d3bdd01a

Anti-theft protection system for a motor vehicle, and a method for operating an anti-theft protection system. Over the sub-base layer is an incompletely impermeable layer the impermeability of which is compromised by openings in the form of slits or by spacing between adjacent strips forming the layer. A spring presses the tip seal against the tank shell. In a second embodiment, a continuous groove-like torus cavity is located in the radially innermost surface of the bead in the proximity of the bead toe. Data is thereby programmed into the selected memory cell.

1459828416-aaae6e65-f8f4-498c-92bf-8fa2a29217ea

A photoelectric sensor includes a light-emitting element and a light-receiving element and detects a mark on an object. Each key switch is operable to couple a scan line to a sense line. At least one of said portable computers comprises a wired protocol module enabling the portable computer to communicate using a wired protocol; a wireless adapter for converting the wired protocol to a wireless protocol; and an antenna coupled to the wireless adapter.

1459828416-fff6a8a7-cc4f-448f-b854-2103ab7804eb

A baking oven for producing baked molded products. This abstract is not to be considered limiting, since other embodiments may deviate from the features described in this abstract. The method may also include provisioning packet switched-based network interfaces on each of the pair of network elements. A substantially flexible lumen is coupled to the cassette. A dynamic average of the bandwidth usage of each priority category is maintained. The bearing piece has a first contact area co-operating with the cam profile to give the hinge at least one stable position, and provides a lock for the hinge when a position of excessive opening is reached.

1459828417-161cc5c1-15ca-4511-892d-6d1ca56944f2

The invention is a device and a method for eliminating vibrations of a mechanical structure with at least one electromechanical converter material that is actively connected to the mechanical structure and connected to an electrical circuit with at least one electrical impedance. The base has a through hole, and the electric circuit is arranged in the base. As such, an energy consumption problem in a sensor network may be reduced, and a data transmission delay problem or a data traffic

problem may be solved by reducing the amount of data to be transmitted. The port is concealed under a label, cover, or in a location that limits access by the device owner, such as the battery well.

1459828417-4e0cc8c3-f542-45a4-8c67-b6aa54312080

A molded insert for attachment to material of a cover intended for outdoor use to cover an article has a front face, a back face, and a plurality of openings through its thickness. The method has three main stages. The function is not computationally complex, and thus accurate estimates of end-to-end delay may be obtained more quickly and therefore be made more useful in real-time network administration. The movement of the cone is locked to prevent reversal of its motion when the packer is set. The expiry time of the message may periodically be compared to the current time to determine whether the message has expired.

1459828417-6a00d6c9-77f3-4398-8b99-a5e5460c30fe

A method by which a halogen atom of a halogen compound can be efficiently replaced with an electrophilic group. The device includes a first compartment suitable for containing a first product, and a second compartment suitable for containing a second product. If the distance is below the predefined distance threshold, the proximity detection module determines, using a capacitance sensor of the user device, a capacitance value associated with the object.

1459828417-7a2e7d42-cff9-4dd8-9f6b-c50f9c7a3476

A method for inspecting packets is disclosed. Using the reference image, the computer vision system detects discrepancies between objects of interest in an input image and the expected object from the reference images. 1 m2g or more and/or an average diameter of 20  $\mu\text{m}$  or less, at a temperature ranging from 25 $^{\circ}\text{C}$  to 120 $^{\circ}\text{C}$ . Another method includes attaching flanges to a set of permanent structure members that form a permanent geodesic dome structure. The resist composition forms a coating having a thickness uniformity, free of defects, and wettable with an aqueous base developer when applied onto a substrate, and has a good storage stability in that particles do not increase during storage in solution form.

1459828417-d5381a19-119a-4f55-ab2f-d6390d5c08a8

A system and method of managing applications and event notifications using a cursor-based. The bat has a handle of a heavy, strong wood such as hickory, to resist breakage, and a barrel of a lighter wood such as sapele, to facilitate a controlled and comfortable swing. A selection possibility is then offered for reducing the phase coding steps and enlarging the field of view and, if selected, the phase coding step width is automatically reduced. The group of memory cells is erased, following soft-programming, resulting in a reduced threshold voltage distribution associated with the group of memory cells. This permits a number of appropriately configured RAM devices to be combined to produce a deep and wide RAM circuit without requiring the use of additional logic blocks, such as buffers, inverters, and multiplexors that reduce the speed of the circuit. The backplate and the substrate are placed within the cavity of the second mold portion and the support pedestals are in contact with the first side of the substrate.

1459828418-4e4ffcd1-e89f-4abc-9e76-31340545a187

Disclosed herein are an adhesive sheet comprising a cured acrylic polymer, hollow polymeric microspheres dispersed and ruptured in the cured acrylic polymer, and hollow parts formed by rupturing the hollow polymeric microspheres dispersed in the cured acrylic polymer, and a preparation method thereof. The electrical power generation apparatus includes a winding mounted to one of the shafts and a field array mounted to the other of the shafts adjacent to the winding. This prevents the problem involved in production of balls of small diameter wherein such balls adhere to an apparatus during production thereof, thus hindering smooth progress of the production process. Each sequence can cause the processor to generate a

corresponding set of control signals adapted to enable the communication device to communicate in one of a multiplicity of communication formats.

1459828418-6bc0fb36-dfdb-4092-b957-fc9e52c3aee4

An RF power amplifier having reduced memory effects is disclosed. The tag unit stores different serial numbers in the respective storage sections. Gases become visible in the image when they attenuate the illumination creating a shadow in the image. A first set of signatures are used to encode ACKs and a second set of signatures are used to encode NACKs. The DRM server determines access rights for the requested content responsive to the capabilities of the client and the policy.

1459828418-6eef8349-00bd-4a3b-84db-e0052c204a46

A contact pin comprises a plunger contacting an electric part, a bottom contact portion electrically connected to a printed circuit board, and a spring urging the plunger and the bottom contact portion so as to separate from each other, in which at least one of the plunger and the bottom contact portion is formed by press-working a plate member. Then, a flow path-switching valve is rotated to switch a flow path to make a flow of mobile phase liquid pass through a loop to thereby introduce the collected sample into a column. The membrane disk is fitted radially outside the valve's seat with apertures leading to a discharge space. The resistive state of the memory cell being read is indicative of the data bit stored by the memory cell.

1459828418-a0585b69-d224-446b-aa9c-51286084b2f3

A first housing member has a catch member that engages a catch feature on an inside surface of a second housing member when the housing members are assembled together. The curb components can be fitted together to lay out the positioning of glass blocks, such that a user can lay out potential designs for glass block walls prior to constructing the glass block wall. In a subsequent sequence wherein the player can selectively keep an award or attempt to sequentially exchange or trade up to a point or award total that enables the player to obtain a final and desirable ultimate award. The hybrid has excellent properties, such as a good film formation property, a high gas selectivity, a low dielectric constant, a good resistance to scraping, and a good transparency, etc.

1459828418-cfe5198b-09d0-4bfd-9679-a8137f374d6e

A digitally based system is designed to sense temperatures at a plurality of places and transmit temperature data along a hard-wire cable or distributed network to an integrated data collection and control appliance. The method comprises saving to the server device a configuration state of the client device, the saved configuration state comprising client network interface configuration information, and a file of the client device. The pressure sensing means displaces the first valve body to decrease the opening degree of the first valve hole according to the increase of the pressure difference when the first valve hole is part of a bleed passage. A second message is transmitted to the first computer using the Push or Pull protocol, the second message comprising data retrieved from the address in the first message. The triple correlation and its Fourier transform are used to obtain the magnitude and the phase of the ultrashort optical pulse intensity in the frequency domain, and the intensity of the ultrashort optical pulse in the time domain  $I$  is determined using the magnitude and the phase by inverse Fourier Transform.

1459828419-18b78760-cc5f-4137-96f2-2a261f849670

According to one embodiment, a semiconductor memory stores a program for causing a memory controller to operate in at least one of first and second modes. These methods provide accurate and clear audio driving directions in a manner that is easy to use. A slide is received in the sliding groove and includes an arcuate sliding face slideable along the sliding wall. The scan lines and the data lines are intersected to define sub-pixel regions. The deflection mechanism is configured

to generally define a plane along which deflection most readily occurs and an edge along which deflection is most readily avoided.

1459828419-5213c093-5f35-40ea-b2a9-be098f0cba21

A method and system for controlling the transmission power of a terminal transmitting frames in a wireless communication system, the frames having a frame structure including a header field containing information related to a transmission rate and length of data transmitted in a frame and a data field having the data. Also provided are methods for making the ink jet inks and edible substrates having the food grade ink jet inks applied to a surface thereof. More specifically, numbers of pixels to be selected are 2400\xd71800, 1280\xd7960, and 640\xd7480, and compression rates to be selected are Fine, Normal, and Basic. When the power transform device is under the high-load mode, both the first and the second spike noise snubber circuits are used to absorb power so that electromagnetic interference is relieved. The gesture module recognizes an input gesture based on the relative positions and whether or not line segments intersect.

1459828419-8c95b1e2-a181-49eb-8f7d-b4172150f443

A connector is capable of mating with a backplane. In a cavity formed in a metal mold for an injection molding, there are arranged a first gate injecting a first molten resin anteceding in one end side in a longitudinal direction, and a second gate injecting a second molten resin following in another end side. The second image is an image in which a depth of field or a focusing position, or both, are different from those of the first image. This can lead to increased nitrogen oxide emission both during the regeneration itself and after the engine has been switched back to lean-burn mode. This resilient lip maintains an elastic engagement with the vehicle body to shelter the double-sided tape from exposure to elements.

1459828420-055ac39d-b1e1-485c-a43a-d3945444c381

In an embodiment, a first device detects a first interaction between the first device and a second device. Furthermore, the invention is also related to the operation of Node B and relay node regarding the generation, transmission and reception of such special sub-frame format. When the encrypted code is in a first base, the plain code corresponding to the encrypted code will be transmitted with a first baud rate; and when the encrypted code is in a second base, the plain code corresponding to the encrypted code will be transmitted with a second baud rate.

1459828420-7e150e60-9789-4498-a537-4ae2b1e19da7

A process of extracting procyanidins by alkaline hydrolysis. The extension screed portion includes a variable length coupling portion arranged in a manner sufficient to permit modifying the overall length of the extension screed portion such that the screed assembly may be extended to a maximum overall width that is twice that of the minimum retracted width. The wafer has a first layer of monocrystalline semiconductor material adjacent a first surface of the wafer. The electrical signal in turn is calibrated by generating calibration references from the swept optical output using known absorption lines within the defined range of interest.

1459828420-80abb1f1-6460-4a88-99c6-589941870da1

A semiconductor radiation detector includes a body of semiconducting material responsive to ionizing radiation for generating electron-hole pairs in the bulk of said body. The aircraft includes a power plant mounted on the airframe producing exhaust during operation. There is described a method, apparatus and a computer program product relating to the processing records in a telephony database. The one or more semiconductor manufacturing processes provide one or more material layers having an intrinsic stress at the semiconductor structure.

1459828420-f47b4062-0d07-454e-8a07-d41fe9e32638

A well cementing composition comprises an hydraulic cement and flexible, acrylonitrile-butadiene copolymer particulate material. A digital image is created

of the calibration pattern, and the edges of the pattern are detected. A controller automatically selects and inserts into the video stream the audio and video of the speaker. A single pull-down stack of transistors connected to a memory cell latch loop provides a read port with low input loading. The received out-of-band signal may be processed via the integrated circuit. A cost value indicates a distance between two points of a set of points, where the set of points comprises one or more start points, one or more end points, and the waypoints.

1459828421-39ae509f-d747-4bc1-a492-56a2cb690a8d

A modular smoke detector has a sensing electrode carried by an insulator module. Carefully synthesized nanostructures are formed to exhibit a large number of defect states within the bulk of the nanostructure. The chuck of the chuck device is located at the center position of the bottom area of the space. The sub-wavelength segmentation can be applied to the spaces or to the lines, or both, of an alignment grating to control the phase depth of the grating. 40 hrs and having two or three film-coatings on the core, the second one containing an amount of the non-sedating antihistamine, desloratadine, effective to provide a geometric maximum plasma concentration of desloratadine of about 2.

1459828421-6370c957-67bc-45e2-bbd7-2d0f0ed43fa2

A high density RF plasma source uses a special antenna configuration to launch waves at frequencies such as 13. The holding device being attached to the room by way of a supporting device. In addition, a circuit provides a pull-up boost current on a transition of the signal selecting the driver that turns off the fighting current, and applies a boosting current pulse to the control node to assist pulling the control node quickly to the first source voltage. A configurable output stage is connected between the internal wiper node and the third signal terminal.

1459828421-8dfa6784-465c-445d-b5a2-d6ca00c9064a

A system and method for producing multiple syngas products. The aperture layer and feed-network layer may be comprised of a low permittivity dielectric material. A protective coating is deposited on the inward-facing surface of the phosphor coating. Better TIM thermal performance and quicker manufacturing result.

1459828421-b86ee6cb-2d80-41ac-92ab-8548bedc86b0

A messaging model and node induction methods and corresponding devices and systems are disclosed herein that are effective to enable an inductor node to induct an inductee node into a distributed computing system and to enable the inducted node to carry out predetermined tasks. The ECU is connected to an engine, sensors, and a MIL. When the cover pivots in a second direction opposite to the first direction, the compressed first spring will facilitate the cover to return to its original position. Each of the two D latches is configured as a master-slave flip-flop that includes a master D latch and a slave D latch. The inspected region corresponds to regions in the master medium including two or more data information regions adjacent to each other in the same track position via the servo information region.

1459828422-421d6ac1-cf5b-48da-b1e9-4a1f88eed4c9

To address the need for a method and apparatus to more efficiently facilitate dormant mode, packet data mobile handoffs, the present invention provides more efficient messaging between the BS and MSC involved in the handoff. The bracket section is integrated with and projected from an exterior of the casing assembly. The copolymer is substantially free of maleate or fumarate monomer segments and the copolymer composition is substantially free of Lewis acids and transition metals.

1459828422-5aa13e12-c7d9-4631-9a20-7c31b77090e4

A method may include generating a first shared secret for a present boot session of the information handling system and determining if a second shared secret existed for a prior boot session of the information handling system. The light sources are positioned to direct light in an upward direction to illuminate the container. The

system verifies the validity of the data before proceeding with processing the data. A body trench 25 is formed in alignment with an adjacent gate electrode 16. Without changing the external measurements of the valve an increased through flow is achieved in that a first section of the flow path leads through the interior space and a pressure space is arranged between the housing and the valve element, in which pressure space in the closed condition of the pilot valve a closing pressure is formed and applied to the valve element. The virtual disk data is backed up to a backup storage using the offset table from the storage snapshot.

1459828422-962703e5-9e5d-453b-8fe4-168c423500ed

A camera has a lens system that includes a lens barrel incorporating therein an image taking lens, the lens barrel being variable in a barrel length between a collapsed state in which the barrel length is relative short and a photographic state in which the barrel length is relative long. Each of the processor units is connected to at least one adjacent processor unit and has one control element and at least one communications interface for providing a data communications link with an adjacent processor unit. The method permits transfer of metals into the aqueous phase with little or no hydrocarbon phase undercarry into the aqueous phase. The second laser stripe emits a second laser beam.

1459828422-d6385a6f-e4a3-4283-9ab9-2417e2dc8170

A system for checking basic input output system read only memory data includes a keyboard, a display, a computer host, and a checking device. The semiconductor apparatus includes an input protection circuit coupled to a wiring provided between an external terminal and an internal circuit, the input protection circuit includes a protection element for protecting the internal circuit from an excessive electrostatic surge input supplied to the external terminal. The probe can also include an input ground to connect to the DUT ground and an output ground to connect to the test measurement device ground. Each generated key value is unique across the replication domain. A plurality of foldable legs are hinged to the bottom wall of the compartment to allow the table to be raised to a desired height in the deployed position or stored under a conventional bed in the retracted position.

1459828423-3db3b0ec-39e9-435e-a3c9-4751fa361c62

According to an embodiment of the present invention, a method is provided for hysteretic control of a DC-to-DC power converter system having first and second switches connected in a half-bridge arrangement at a common node and through an inductor to a regulated output terminal, wherein the regulated output terminal is connectable to an output capacitor and a load. In accordance with the method, during the start of the gas turbine, the generator is connected to the electrical grid via the frequency converter before the operating rotational speed of the gas turbine is reached, wherein the frequency converter is controlled such that it generates an output current with the grid frequency. The pumpmotor may be reliably assembled in the field while maintaining precise axial and rotational positioning of the rotor sections. In an intermediate state the cover frame is fastened at the door columns in another position as in the mounted state, so that the inner door panel is removable from the inner sides of the door columns. Corrective actions can be implemented in response to changes in the crepe structure. The processes of this invention include a transalkylation section and a disproportionation section in the benzene and toluene-containing feed is directly provided to the transalkylation section and in which a benzene recycle loop in the transalkylation section isolates the disproportionation section from C6 naphthenes.

1459828424-1b9cfd2c-4854-4ed3-b379-b898feaf70b2

Systems and methods are provided through which compare instructions in computer code are eliminated partially resolving the predicate of the compare instructions. The arrangement and method utilizes an alternator used, in one embodiment, to charge at least one battery for the electrical system and switches the output of

the alternator between a battery charging mode of operation and an auxiliary power mode of operation. At least one intermediate element is provided between the catch and the stop and is supported, when impinged upon by the catch, on the housing and on the stop. A locking tube has one end in the passageway in facing relationship to the retention assembly and the other end in engagement with the riser to prevent the retention assembly from moving out of the first opening of the passageway. The spindles are introduced into and guided in said slots and an upper end of the lever protrudes beyond the upper edge face of the end plate holding the roll, while at the same time facing the outer wall thereof. Although the meaning or purpose of the data may be similar or identical, the differences in data formats required by the various computer applications and platforms renders such sharing difficult.

1459828424-6908a0b7-3373-4a56-a12a-89ebf7b60109

The invention relates to a circuit comprising at least two parallel-connected light-emitting diodes opposite poled in a first parallel branch and comprising at least two parallel-connected light-emitting diodes opposite poled in a second parallel branch, and also comprising a capacitor and a coil. The unit includes a gurney, a detachable power unit for propelling the gurney, and a docking unit. The data calls are allocated varying portions of the connection's available throughput. As such, the occlusion sensor can be used to indicate when the fluid is flowing or not flowing, thereby permitting the infusion pump system to communicate an alarm to the user if an occlusion exists. The second product is a product of factors including a flow passage length along, a viscosity of ink in, and a fluid resistance coefficient of the ink return line.

1459828424-861d04f5-30c4-4ed2-a10a-0a106f56b8bb

A control system comprising an electrical circuit that produces distortion where the electrical circuit has a frequency band of operation. The integration network device receives a connecting request from the VDI user device. The seer lever pivots relative to the trigger housing. The originating PE is capable of receiving a message from a user PE, the message including a third knowledge digest encoding third configuration information related to the user VRF. If the first switching field is adequately higher than the second switching field, the first and second MTJ may each contain a data bit. The control computer calculates an average period of a binarized wobble signal and a variance of the period of the binarized wobble signal.

1459828424-cbe785ba-9837-4247-868d-90b27b3796ca

A magnetic recording medium, comprises a substrate; and a Co-containing spinel-type iron oxide thin film formed on the substrate, having a Co content of 1 to 20 mol % based on Fe, a coercive force value of not less than 159 kAm, a thickness of 5 to 200 nm, a center line average height Ra of 0. Therefore, frequency dividing performance can be greatly improved in comparison with that achieved using conventional technology. To prevent instability in the main loop caused by the duty cycle modulator and FIR filter, the delta sigma modulator also includes a stabilizer loop. The integrated circuit may be any type of integrated circuit that stores dynamic data, such as a memory device like a dynamic random access memory, DDR DRAM, SDRAM, or RDRAM, or other type of integrated circuit such as a microprocessor. This structure yields good adhesion between the three layers, because the third layer adheres relatively well to the first layer and the third layer and the second layer are mechanically bonded together relatively strongly by the anchoring elements. As disclosed herein, the present invention maximizes the extraction of information by incorporating a new generation of transmitted-reference transceivers that utilize a single reference pulse or a preamble of reference pulses to provide improved channel estimation while offering higher Bit Error Rate performance and data rates without diluting the transmitter power.

1459828425-5b1d672d-3d80-4e45-8459-ddcee6c23cdf

A system and method for controlling an Ethernet node's boot-up process. The warhead

effect modules are of modular design, and the various modules are secured to the fuselage or casing by securing devices and/or retention parts. Signal degradation data is calculated based on noise figure parameters, hardware parameters and environment parameters. A linkage is connected pivotally to the mainframe, the front caster frame and the drive wheel frame. Traffic demands are then routed across the links of the network in such a manner as to minimize the maximum value of link utilization. In one embodiment, the diagnostic method involves determining the expression level of TOM34 that discriminates between colon cancer cells and normal cells.

1459828426-0a1fc55d-3259-472a-9a14-7e91097afca9

The present invention provides methods and compositions for modulating cell senescence and cell proliferation using isoforms of the p53 tumor suppressor protein. The gas generator further includes a cap arranged for displacement along the inner wall and delimiting the igniter chamber, said cap having a cylindrical peripheral wall and a radially extending cover wall. A sponge is disposed distally of the seal and absorbs fluids that enter the seal housing. The filter device can be used to ionize the ionizable interferents existed in the air, separate the ionized interferents from the other components of the air under the influence of the electric field, and discharge the interferent out of the filter device, thereby reducing the consumption of the consumables or even eliminating the need for consumables. The cable coupling is configured to attach a cable to the pipe splitting assembly.

1459828426-0fc62e48-7889-42b9-aa67-5964276b9400

This invention discloses an ion implantation apparatus with multiple operating modes. The core is formed of a polybutadiene compound that produces a zero compression. The template is preferably a few monolayers thick. The lower substrate is then assembled with an upper substrate and has an LC layer inter-filled. The washing machine dries a small quantity of the laundry without application of any additional drying pipe or heater. The weighted plurality of feature segments may be superimposed to form a third feature.

1459828426-3031a8af-6706-4372-921e-894997014de8

A backlight unit comprising a boost circuit and a backlight element. The system provides real-time searching of large numbers of ccTLDs for each user so that during a single web session, the user can simply select the available ccTLDs from the resultant list, and purchase the desired ccTLDs online. The restricting member is provided on a supporting member for supporting the image-forming lens and the image sensor.

1459828426-95a76749-d7f6-4ebd-b16f-ba8d7b2def7a

An aircraft body structure is disclosed and has a skeleton frame including a plurality of interconnected frame elements. The fuel composition is prepared by a process and is useful in a process, where the fuel composition includes a medium that is a hydrocarbon or a nonhydrocarbon or a mixture thereof, to increase the efficiency of an exhaust after-treatment device of an internal combustion engine. From the pixel to be removed and the adjacent pixel, pixel data is generated by using a predetermined calculation equation. An electronic circuit measures the voltage drops and compensated accordingly operational signals passing through the terminals, the probes and the interfaces during the chip testing.

1459828427-1d0acada-9b1c-487a-995b-c2b26c6014ee

A tunable nitrous plate assembly for fuel injected 5. This bolt operates independent of the valve pin, which increases cycle speed and enables the governor to open and close at an optimum time in the firing cycle. Q-bits are formed without requiring a separate transistor for each Q-dot by multiplexing the calibration. Further, in the invention, terminal may be a set of user devices, the set of user devices includes one or more devices, each of said devices provides media

interaction capabilities for one or more communication channels, and each of said devices is mapped to one or more media objects in said SMIL document. The quality data is for the supplied component or provided service over a baseline time period.

1459828427-6ca8790f-4518-4f62-bef1-db29ed90d1c7

A closure is provided and comprises a body and an inset. Therefore, regardless of the rotational condition of right and left wheels, namely, even if one of the right and left wheels stops, the oil pump is driven by the driving force of the rotating differential case, thereby reliably operating the torque distribution mechanism. In one aspect the shared pixel unit circuitry may include a shared source follower transistor. The HDL files also include a statement that instantiates an instance of the Dial in association with the configuration latch such that a one-to-one correspondence exists between a value contained within the configuration latch and an input value of the instance of the Dial. In an exemplary embodiment, perforated end panels having diffuse, reflective interior surfaces may be provided over at least a portion of the inlet and outlet apertures.

1459828427-7fcb2b12-b63f-4f38-af65-19510cd0afd1

A compact, solid state, high voltage switch capable of high conduction current with a high rate of current risetime that can be used to replace thyratrons in existing and new applications. Vias through an insulating layer connect the driver cells to the memory elements. The wick trimmer is assembled as a cylinder inside a cylinder in which the inner cylinder has a steel blade at the bottom. Device performance is monitored throughout the burn-in process.

1459828427-b1f4260a-bfa4-4615-acc3-fb54c73ab9ef

Techniques are provided for optimizing multicast routing in a network. The system comprising a housing adapted to capture the fan therein. Compositions of the invention comprise at least one isolated peptide having a defined sequence of amino acid residues and the composition is capable of down regulating an antigen specific immune response to an offending antigen in a population of humans subject to the antigen specific immune response. The central bore is lined with an anti-skid material that engages the fishing rod such that the grip and the rod are not likely to move with respect to one another.

1459828428-04666d1f-8ccf-4a64-abdd-bfc9509449a0

A communications module that permits remote meter reading of a utility meter via a wireless modem that communicates using data packet networks along a communications system, such as ARDIS. The locking device includes a seating member and a posted member. A predetermined surface of each silicon arm is formed with a piezoelectric part, whereas a predetermined surface of the piezoelectric part is formed with a thin-film electrode. Other embodiments advantageously incorporate the method into methods for making PMOS devices.

1459828428-69bc766a-c19f-410f-88ca-5f2918215c93

A screen system for marine thrusters having at least one constrictor for reducing exit jet cross-sectional area to increase exit jet velocity of a thruster. The ECC duct includes side supports for preventing the flow-induced vibration in the annular downcomer, and has structural stability while thermally expanding and contracting. An embodiment of the present invention can be used as a retrofit device in a mechanism to encrypt information without causing undue interruption of normal operations. , provided as instructions for operating in a host computer system for converting a provided virtual processor model to a user virtual processor model. For projecting the images on a curved surface, the geometry of the images may be distorted using electronic image warping and/or lens-based optical distortion.

1459828428-c99538c2-710c-49a5-acaf-94d9d3737804

A connector guide mounted in front of a receptacle connector is provided with a

latch that engages a connector mounted on a circuit board when a mating connector is inserted into the connector on the circuit board. A second thread may be initiated to take over the performance of the real-time task on a second core of the multi-core processor while the first thread is performing the real-time task. A magnetizing assembly includes a plurality of magnetizing coil units.

1459828429-bc25fbd5-fa90-4ef1-b901-9be9f734737b

A garment for infants comprises a comfort component serving as a base, a plurality of signal transmission paths integrated within the comfort component; and at least one interface that provides a transmission path between the information infrastructure component and an external device. A list of recipient audio clients is built for receipt of the multicast audio data over the power line communication network. The accelerometers and the gyrometers are connected to the flight control computer and their measurements serve as flight control parameters. The comparators read a 3D image signal and compare this 3D image signal with a reference signal to obtain a color code value by decoding. A sealing portion 19 is formed by fastening the union nuts 6 to the end portions of the lid members 5 to press the tube 4 from the outside of the tube 4.

1459828430-21e80512-9262-42d3-9fb0-8d485e3c3054

A method and apparatus for extracting a representative sample of water, oil and sediment from a container. The device includes a substrate member. The markers are associated with tests identified in a requisition received with the sample and some markers may be associated with unrequisitioned tests. The method consists of computing the coefficients of a tenth degree polynomial and subsequently finding its roots. A backlight module using the point light source is also provided. The hemostatic valve has a passage extending therethrough, and includes a sealing flap movable between an open position relative to the passage and a closed position relative to the passage.

1459828430-35a744c3-79ff-40a3-a6cc-af2d5831ec84

Super lattice structures in conjunction with a tunnel junction to provide an improved contact for multiple components. The two devices are included in a network, such as a mobile telephone network. Thereby, the vent valve substantially regulates the flow of gas through the washout vent over a range of gas supply pressures. The indicating data is at least partially indicative of the identity of the at least one region and at least one of movement and a position of the sensing device relative to the at least one region.

1459828430-626bcda3-c253-4c2e-9c63-bbfbc6b8cd5d

An apparatus and method are disclosed for determining an empty condition in an item of media container. The transaction terminal produces current transaction data that includes customer identity, and goods/services being purchased and their prices. Using the device, users can quickly and efficiently access movie information without having to type in information, or specifically request the movie information to be downloaded to the device.

1459828430-7104a685-d281-4128-8304-6672239e28c6

A hook member of a vehicle seat lock engages with a striker fixed to a vehicle body. Also disclosed for firearm projectile assembly apparatus is a pressure shield; and a non-discarding attachment of the pressure shield to the bullet, such that after the projectile assembly is fired from a firearm, the pressure shield does not discard from the bullet during the bullet's flight to a target. The controller sends signals to the repositioning motor to move the ambient air exchange door to a position which produces the required ambient air exchange rate to preserve the load.

1459828430-8c872b54-52d6-432e-9b43-e20ca569404c

A semiconductor device is formed of two or more dice of similar dimensions and bond

pad arrangement, in which bond pads are located in fields along less than three edges of the active surface of each die. The system includes an electronic control unit configured to receive a control signal generated in response to a command from the living being and to generate a plurality of virtual bodies on a display including members of a virtual prosthetic limb and at least one virtual object. According to other aspects of the invention, there are provided basestations and network nodes for performing these methods. The pump unit includes a suction member which is displaceable within displacement space substantially along its longitudinal axis. The transactional arbiter generates the completion status for the transaction in progress from each client. The system may be provided with a tilt compensator comprising a tilt sensor mechanism outputting a tilt compensation signal indicative of the extent of tilt of the device, and may be further provided with an adjuster for adjusting the distance value in accordance with the tilt compensation signal.

1459828430-c70d2c86-7eb4-4804-a7a8-734a8f644bb7

A pixel circuit with a dual gate PMOS is formed by forming two P+ regions in an N<sub>+</sub> well. The method includes establishing a user account for a user and associating a user identifier with the user account. The compositions may also include an amount of boron, and bimodal vinylic polymer made up of quantities of high and low molecular weight vinylic polymers such as PVA. Accordingly, when a winding stem is pulled by one stage, the reset lever performs the planar movement in the given direction and a distal end portion of the reset lever is brought into contact with the overhang pattern. The pretreatment apparatus is supplied with an amount of fresh water and an amount of backset, the backset including the biogas effluent recycled from the biogas apparatus to the pretreatment apparatus.

1459828431-5d8be17f-9f8d-452e-8185-fa6f3520fca7

An imaging system utilizes an exposure control circuit to control the length of an exposure in full frame mode. The free reactive groups are capable of reacting with active moieties in a biologically active agent such as a protein or peptide thus forming conjugates between the activated polyoxazoline and the biologically active agent. Each single sensor located at each station activates when the wafer's edge traverses through the sensor's path. During the insertion event, a comparator unit coupled to the voltage sensor, sends a first switching signal to a switchover circuit that responds by connecting the peripheral device and an uncharged battery to the main bus such that the supply voltage is provided thereto. The plethysmogram signal is analyzed by the programmer device to obtain a cardiac performance parameter, e. As the sliding plate is oscillated, disposed toner falling and fed through the disposed toner duct is oscillated.

1459828431-71316a68-da69-4f2e-a670-7100ef1811bc

Provided is a terminal and an access point in an active mode for multi-user transmission opportunity power saving that may decrease power consumption by changing an operation state of the terminal from an awake state to a sleep state if there is no stream of data to be transmitted during a TXOP duration. Each of the pressure generation elements is fixed to a fixation plate. A reflective-coating mixture is air sprayed onto the pre-treated component surface.

1459828431-a27f9458-04bf-4138-9893-d4e3c18e9de7

An apparatus including flexible tube having a first opening at a first end, an opposing second opening at a second end, and a body portion between the first end and the second end. A source electrode layer and a drain electrode layer are formed by forming a conductive film to have a two-layer structure, forming an etching mask thereover, etching the conductive film using the etching mask, and performing side-etching on an upper layer of the conductive film in a state where the etching mask is left so that part of a lower layer is exposed. The distributed storage processing unit sends the layered, encrypted message to the first storage unit in the chain, which decodes and removes the outermost layer, and forwards the message

to the next storage unit in the chain. At least two of the side faces confront each other and have a heating element passage therebetween.

1459828432-06f5214a-7978-4c0e-b4ef-974230f31b58

A rewrite component automatically generates rewrite rules that describe how uniform resource locators can be rewritten to reduce or eliminate different URLs that redundantly refer to the same or substantially the same content. Data related to items that are supposed to be in the possession of an employee may be retrieved from distributed data sources. First frame data are received from the first device via the network. A surgical lighthouse is similarly connected with the voice recognition system and is responsive to a second set of the command output signals to initiate selected surgical lighthouse operations.

1459828432-45563365-72c1-45e5-ab5e-d4ef66e998da

An exemplary lithography process may include: receiving a substrate having a photo-sensitive layer; providing a light source capable of causing an exposure of a portion of the photo-sensitive layer; and providing a mask capable of defining at least one pattern that is to be transferred to the photo-sensitive layer. The texture unit performs a texture mapping operation for mapping a texture to an object in a three-dimensional space. The gradually changing portions have a thickness gradually increasing from the thinnest portion toward the thickest portions. The object container is typically a deep-frying basket.

1459828432-5291c2b5-0ed7-4651-8a03-1f1d9f430798

In an embodiment, a system includes at least one peripheral device, an interrupt controller, a memory controller, at least one CPU, and an interrupt message circuit coupled to the peripheral device. With the profiling of components based on the common information model, a remote agent can query status/capabilities or configure a power over Ethernet component based on messaging that is consistent with a power over Ethernet common information model schema. A second validation parameter is determined for the data stored in the memory at a second time, and also stored. Thus, heat generated by the inner stator is dissipated to the outside through the housing boss portion and the partition wall portion. Interconnect channels embedded in the sensor facilitate streamlined packaging of the device while accommodating interconnectivity with other devices. As a result, elements suited for use in pipelines can be obtained, without unnecessarily increasing the wall thickness of the seamless bent pipe and without internal machining of the pipe end portions of the seamless bent pipe after the manufacturing thereof.

1459828432-c0753cc9-f322-42ed-ba05-511d30ce2dbe

A child's learning device includes a housing, a countdown timer and a driving mechanism. These mechanisms and methods for automated test case generation and scheduling can provide an automated manner of generating test cases and scheduling tests associated with such test cases. A shunt transistor including a plurality of series-connected field effect transistors is connected between the transmission terminal and a common terminal, such as a common terminal, which may be an electrical ground. Radiation from the skin surface is detected to prevent non-reversible damage to the dermis, such as skin necrosis and excessive collagen melting. Thus, the LEDs in the light emission part are used not only as image display device but as an indicator. The tool may have an integral coaxial cable stripping function included therein.

1459828432-e4e3dd39-7fd8-4de7-95ec-f60c27a9ca88

A liquid application system for applying an insect repellent to skin of an animal or a person includes a tube receiving a liquid to be applied to skin. The nanofiller introduction is downstream of the area of the extruder wherein the polymeric material had been substantially melted and mixed. Each assistant fitting of a receptacle connector includes a receptacle lock surface that faces in a direction approaching the connector mounting surface and is opposed to the plug

lock surface in a mated state. The outer surface of the major wall defines a first major outer width, and the outer surface of the minor wall defines a first minor outer width, the first major outer width being greater than the first minor outer width. Movement of the first portion with respect to the base pipe in response to overcoming the first shear resistance exposes the port to permit fluid communication between the interior and the pressure chamber for setting the down hole tool.

1459828433-39d32708-6fb7-4378-9fb2-bd6a12ddebb7

In one form, a memory includes a memory bank, a page buffer, and an access circuit. The cam phaser is connected to and adjusts a timing of operation of the other of the intake camshaft and exhaust camshaft with respect to the one of the intake camshaft and exhaust camshaft. Updating position information with actual turn data improves the accuracy of GPS navigation especially during single satellite navigation. Calculating the correct length and bending the pipes to fit in the space available resulted in increased horsepower, reduced fuel consumption, cooler cylinder head temperatures, reduced noise and vibration for four-cylinder and six-cylinder aircraft engines.

1459828433-790fcd4e-a617-4158-9869-fee4adb8ad32

The invention relates to compositions and methods for decoding microsphere array sensors. The compositions have particular utility as barrier test dips for protecting cows against mastitis and as wound care agents. The power storage equipment can be connected in series with the inverter device, and a voltage sensor that detects the overhead wire voltage  $V_s$  is provided between a current collector device and a grounding point.

1459828433-910a75d2-1132-4ddf-bbdd-2c3f73fdb3e4

A magnetoresistive film of a structure comprising a non-magnetic film being put between magnetic films. The first positioning arm crosses the second positioning arm at first and second crossing points. The driven wheel rotatably supported about the first axis and the idler roller cooperating with the driven wheel to engage the sheet there between. The techniques disclosed are particularly conducive to low power supply availability applications such as battery operation. A shielding barrel is electrically connected to the at least one cathode and disposed in the container.

1459828433-bb927ff5-bea4-4efb-a66a-3a07da5d485f

Described herein is an implementation of a technology for managing credentials. The use of multi-layered lenses may result in as much as a 50% decrease in transition time between states. As an improvement, two arrays of wires extending over flat supports in two directions in space are proposed. Changing the contents of the line by the user thus becomes a coherent operation, so that the device will less readily respond to unintentional actuation of the controls. A follow-up message is transmitted from the server computer system to the mobile device if the password is not received from the user computer system at the server computer system within a predetermined period of time. A locking portion of the at least one pin and a locking surface that defines an opening in the hinge bracket are configured such that the at least one pin is locked in a fixed position relative to the hinge bracket when assembled.

1459828433-c6939179-9209-4e95-9e1d-d2aab151dd7d

A burner having two ignition electrodes and a bracket is provided. The cutting ends each have a cutting tip at a distal end, a body portion, a recess in the body portion and a retainer positioned in the recess. The payee registers a payee identification data with the electronic third party identifier.

1459828433-d4e52fd5-b0f5-4b88-ac80-741460054737

Embodiments of the present invention provide a system and a method for publishing

advertisement service information. An example of a method for determining a mobile device location includes receiving signals from a transmitter, measuring signal characteristics of the received signals, and downloading data from a database corresponding to a defined region associated with the transmitters. A pin belonging to the group is selected as a pin under calibration. Both the electrodes and beam blockers are controllable to reduce the area of the ion beam that is incident upon a substrate.

1459828434-39e6001c-2f72-423e-ae9b-c81696731629

A solenoid valve includes an outlet tube and a plunger stop. The wheelchair lift platform includes a first portion with an elongated support having fixed and moveable platform sections and a linear actuator powerable for moving between outboard and inboard positions. Exemplary methods include, but are not limited to, methods of drilling with the settable fluids, methods of cementing with the settable fluids, and methods of using a settable fluid to displace another fluid from a well bore in a subterranean formation. As the cell current is increased, the read speed of the device can be increased.

1459828434-9dddd6a8-d9b8-4554-8513-30f894edd101

A silver halide emulsion formed of high silver chloride particles, the high silver chloride particles having a continuous outermost layer containing at least 30 mol % of silver bromide, the high silver chloride particles having a silver chloride content of at least 95 mol % and a silver iodide content of 0. The LED light source with optional collimating optics is arranged to couple at least part of the light source light into the waveguide element via the waveguide edge of the waveguide element. The wedge members have wedgelike edge flanges which protrude into the grooves of the opposed upright edge rails.

1459828434-f15dc22e-6c91-47bf-8cb5-324c33a1b50e

A method for monitoring noise associated with a communication link is provided that includes monitoring a plurality of communication links that facilitate a plurality of communication flows and determining whether an error parameter associated with a selected one or more of the communication links has exceeded a predefined threshold. The obtaining unit obtains a phone number which is associated with a message from a transmitter. A corresponding method is disclosed. The RTR consists of two clamshell sections and a tail boom section. The present invention also finds a preferred application in the field of biomedical diagnosis or in food microbiology, and more particularly in bacteriology and mycology. The hydraulic cylinders are operated by attachment to a tandem pump to cause them to operate in a synchronized fashion.

1459828435-19626438-9047-4b38-8dab-7cad1931278a

A turbomachine includes at least one rotor, at least one stator, and a casing, with the rotor comprising several rotor blades attached to a rotating shaft, and with the stator being provided with stationary stator blades, the casing being passed by a fluid flowing through the rotor and stator. The holding rod is provided with an inserting end on the top to be secured to the bottom end of the elastic stem. Successive groups of buttons provide for the control of different appliances or devices, where each group of buttons is identified by easy to comprehend icon or alphabetic representations.

1459828435-27eb60a3-ded4-479a-b549-f6e99da98b23

A method and apparatus for eliminating picture artifacts in a video media system is provided wherein a video recorder, responsive to a trick mode command, iteratively transmits one or more frames in a video signal recorded under an interlaced scanning format for display on a display device. The system includes a data acquisition component, an analytics server and a client terminal. The logic design includes multiple nets.

1459828435-e8902ca8-1c3d-4bcb-8542-df21f91aea14

A transmitting and receiving module helps reduce electrical crosstalk and noise during transmitting and/or receiving signals. The outer tube defines a longitudinal axis and a longitudinal slot along a distal portion of the outer tube. The receiving component and the push component are opposite to each other and are connected by the connectors. In some embodiments applications of encapsulated semiconducting nanomaterials are described.

1459828436-42408239-fb00-4d61-8588-42a06ba8aa25

One embodiment of the disclosures made herein is a method for facilitating mediated communication. The method includes the steps of: forming an ID circuit at the predetermined position for an ink feed slot near a print head chip, not cutting or cutting the ID circuit during the ink feed slot processing according to the ID characters to form an ID circuit that is able to recognize the type of the inkjet chip. These products are used in a polypropylene net and are swept on the surface of water basins, harbors or the surface of sea to collect the oily matter and the petroleum by endomolecular absorption and by external surface adherence, and the loaded net is washed with petroleum to remove all absorbed oily matter as useful fuel. The pictorial information is displayed, for example by an existing EFIS or weather radar display, in the form of polygons. The switching element may be realized by an electromagnetic relay device, or by a thyristor-based switching device such as a triac device.

1459828436-bcf6e13f-76dc-458c-b523-106b57c000dc

Described herein is an apparatus for transporting and reorienting an object on a base surface includes a first header coupled to a first side of the object, and a second header coupled to a second side of the object. A semiconductor substrate is placed within a reaction chamber. An insulating layer is formed on an entire surface. The method may include decreasing the first width of the fin while maintaining the initial height. An encapsulant mold is placed over the substrate and chip and an encapsulant material is injected into the encapsulant mold cavity through an interconnection channel. The sealing mechanism is electrically connected to produce heat for sealing the workpiece being put thereon when the press bar pressed against the sealing mechanism.

1459828437-45ca20e8-e7b3-47c5-ab09-4f9c77120f8c

A scroll type compressor has a fixed scroll, a movable scroll and a plurality of sealing members. In one embodiment, the quantization error vector represents a difference between a cost value vector and an input candidate vector. Removal of the molded product from the core mold part is at least helped by injecting compressed air into the closed end of the product. The plasma ashing not only trims a surface of the organic passivation film but also roughens a surface of the counter electrode. Matching MPRs provides an effective way to view the 3D volumes for anatomical changes over time and to monitor medical conditions such as stenosis and tumors. A plurality of corrugations are formed in the axial leg so as to make it compliant in the circumferential direction.

1459828437-57d4e16e-ff0d-40e4-bafe-eccff65cf823

There is disclosed a suction dredge system and method. The support structure includes a vehicle body frame having front frame side members extending in the front to rear direction of the vehicle, a sub-frame disposed below the vehicle body frame and that supports the engine, and connecting members that connect the front frame side members and sub-frame. These interim images are then analyzed. In some embodiments, a hidden screw feature can be included in a SIM tray slot of the electronic device. A bolt rod is fixed to the valve. Each operating mode is characterized by a corresponding energy usage profile.

1459828437-74801495-f928-40db-9066-7dffaf3f4692

A semiconductor chip having a semiconductor substrate; a surface protective film

covering the semiconductor substrate; and an interconnection having a portion exposed on the surface protective film, at least the exposed portion of the interconnection being composed of an oxidation-resistant metal material. The present invention takes advantage of codes where most randomly selected data units fulfill the coding constraints. These light emitting elements are enclosed in an outer bulb housing that may include an optical tuning element and provided with the proper base for connection to a power source, e. Then, the data of the current data block from the current buffer are stored into memories connected to a current one of the memory buses, wherein the following buffered data block of the related data stream is later on stored into memories connected to a following one of the memory buses, the number of the following memory bus being increased with respect to the number of the current memory bus. Thus, the encapsulating membranes of the present invention are particularly suited for the reliable, durable and controlled transport, delivery and storage of materials.

1459828438-3ee514e0-b71d-408d-91e3-0b6122925a66

An electrical connector assembly comprises a first connector and a second connector having a same configuration with a housing and a mounting face adapted for mounting onto a printed circuit board PCB except for a distinguishable portion provided on the housing adjacent to the mounting face thereof. The addition of the heavy ions or heavy elements allows for a more effective anti-reflective surface than is found when only hydrogen implantation is utilized. If the result of the prior RTT test is successful, authentication processing uses the result of the prior RTT test as the result corresponding to the current authentication request. The method comprises forming at least a second recirculation flow obtained from the head flow rich in methane downstream of the separation column and forming a dynamic expansion flow from the second recirculation flow.

1459828439-2c006588-8a37-47de-9f40-3d5f4258785e

A new and distinct regal geranium plant with white flowers having purple feathering above medium green foliage. The tap unit includes a circuit having a first line connected at spaced points to an inner conductor with the RF signals flowing through the inner conductor and the AC power flowing through the first line. The pseudo-random vectors generated by the set of PRPG values are simulated, and those vectors best suited for an IDDQ test are selected. , glass, having a homogenous distribution of luminescent hydrogen terminated silicon nanoparticles in a homogenous distribution throughout the solid.

1459828439-d375ff17-e04d-4df4-b83e-872b1419ea2e

Systems and methods of power management provide for using transient running average power limits to enhance device power consumption and platform power delivery. A transceiver is carried by the housing and is coupled to the ionized air chamber. A triangular cam on the detachable capture in conjunction with a \u201cv\u201d groove in a magnetized lever of the catch permits a pin of the catch to be selectively retracted from or extended into an aperture of the block when the lever is rotated so that when the pin extends, it serves to secure the combined apparatus for cutting. Cell reads are performed multiple times and the read threshold voltages averaged to more closely approximate actual threshold voltage and to compensate for random noise. The management unit is operable to select another ground station when a signal strength corresponding to the other ground station exceeds the signal strength corresponding to the selected ground station by more than the threshold value set by the management unit.

1459828440-c949d3b0-69d5-4ea7-b5b5-c4471d52c769

In an Internet processor, it is determined when a potential transmission of information over an Internet connection is about to occur. The dummy block has a clock terminal receiving a clock signal, a scan input terminal connected to a scan data line within the scan chain, and a scan output terminal connected to another scan data line within the scan chain. The elastic member is provided to bias the

rotatable hook and the lever is used to rotate the rotatable hook for assembling or disassembling by means of overcoming bias force of the elastic member. The complex values are the m degree of RRO frequencies having frequency characteristics to be multiplied P) or \u2212PP). In a second aspect, the lamp assembly includes a sealed transparent sleeve that entirely encloses the lamp circuit so that the transparent sleeve is fully closed and unpenetrated.

1459828441-35134839-74f0-4554-8b86-f39101868fb7

A flexible chain guide guides the slack side of a length of chain that extends between a drive sprocket and a driven sprocket. In an embodiment, the method comprises the steps of receiving a first message selection, where the first message selection includes at least information associated with a road hazard. Each of the cameras is configured so as to be selectively set to a full scan mode and a partial scan mode. The receptacle and heater packet are preferably hidden from view, and are preferably situated to direct heat generated by the heater packet toward the neck of the wearer. When the component is a brittle ceramic heat shield wherein a crack having a critical length is of concern, the electrical conductor is located at a predetermined location wherein a critical length crack in the component will propagate into the conductor. An attachment is removably secured to the frame to allow a portion of the hose to drape over an attachment roller to extract water from the hose and to allow a power-driven winding rod to wind the hose into a coil.

1459828441-35f2d73e-fe2c-4915-9f41-dc791ffc953b

The invention relates to a machine tool, particularly a machine reamer, comprising a shaft-type base and a replaceable cutter head which frontally protrudes from the base. A cover member is fixed to the cylinder tube in a state in which an attachment base is secured to the slide table. A similarity raiser corrects, based on an analysis result of the spatial information analyzer, a difference between the spatial information of the L channel signal and that of the R channel signal, to raise a similarity between the L and R channel signals. A first catch mechanism of the cover pivotally engages the opening so as to form a lever arm. Molten metal particles from which the fumes are removed form the thermally sprayed film on the inner face of the bore. The opto-electrical device, the micro lens set, and the optic fiber connector are thus precisely aligned.

1459828441-907790d4-973a-4b96-9ab2-c47a2c4477c7

Processed cheese is prepared in a process where the ingredients include at least 0. The seats are capable of 360 degree rotation about a longitudinal axis which extends perpendicular to the direction of travel. Data blocks within the memory are specified by accessing devices using a logical data block address, including a page index and a data block index. The runner has a closed end and an open end into which a fluid mixture for the article flows for distribution by the runner into the film gate.

1459828442-1bef4d18-36d8-4a5d-abc5-e103bdb36019

The application relates to an anti-snoring device comprising a compressor and a nasal air cannula, the air compressed by the compressor being blown through the nasal air cannula into the nose of a sleeping person. The device also includes a second jaw having a distal portion for communicating with tissue and a proximal portion having a first slot and a second slot, the first slot disposed between a middle structure and a first lateral structure, the second slot disposed between the middle structure and a second lateral structure. An interactive element associated with the displayed content item is provided on the client display, which a user clicks to indicate that the user has found the displayed item helpful. The strip has an upwardly protruding locking element engaging in a locking groove in the rear side of the other joint edge to form a second mechanical connection locking the panels in a second direction parallel to the principal plane of the panels and at right angles to the joint.

1459828442-3c78716d-75b1-4919-a17e-eb28ef7373fd

A method and apparatus for processing an electronic document in a secure manner is provided. The fan drive unit is in fluid communication with the pump through a modulation valve. Each chamber has a dielectric layer proximate the side of the heater element which has a thermal product less than 1495

$\frac{Jm}{Ks}$ , the thermal product being 12, where  $\rho$  is the density of the layer, C is specific heat of the layer and k is thermal conductivity of the layer. N can be a conventional blocking group or other group such as -A-B.

1459828442-8166a661-adc8-4d54-8974-66a78026974e

A method and system for operating a wireless access point is disclosed. This can be done by requesting retransmission of the first packet and measuring the actual time delay between request and receipt of the retransmitted packet. When X is halogen or a sulfonate, the compound of formula I may be prepared by reacting a compound of the formula III with a halogenating agent or a sulfonylating agent. The method may further include generating a model based on the historical user preference and usage data, determining one or more predictions from the model. The flexible winch tether has first and second portions releasably connectable to one another, the first portion being connectable at one end thereof to the support structure and at a second end thereof to the second portion, and the second portion being attached at one end thereof to the winching device, and being connectable at a second end thereof to the first portion. The inventive compounds include polypeptides containing at least a portion of a prostate tumor protein.

1459828443-29945eef-5771-44ed-8c2e-f70df5459a9d

A system and method are described for ordering a database flush sequence prior to committing transaction changes to a database. Also provided is a multi-path network and an Ethernet bridge or router incorporating such a multi-path network. The charging of the battery is halted after a maximum full-charge time period is elapsed. A determination is then made as to whether or not the IO assignment meets certain predetermined power distribution requirements.

1459828443-2dad79e1-a5f9-4767-bbf3-f31217bb9245

There is provided an aluminum battery which comprises a positive electrode, a negative electrode containing at least one kind of active material selected from the group consisting of aluminum metal and aluminum alloys, and an electrolyte containing a halogen ion and at least one kind of ion selected from the group consisting of sulfate ion and nitrate ion. Alternatively, the PD is mounted thereto so that the light receiving plane of the PD is inclined at angles ranging from about 0 to about 30 to the center of the optical axis of the backward light. According to another aspect, the technique can be implemented within a decoding pipeline such as a JPEG/MPG decoding pipeline in such a way that multiple transfers of image data in and out of the external memory can be avoided. A valve is connected between the second passage and the drain outlet for controlling the draining of the liquid and sweep air flow through the second passage.

1459828443-690f90da-e791-472b-ac7f-760f346675b2

A memory controller, such as a SDRAM controller, forms a queue of memory access requests to maximize efficient use of the bandwidth of the memory data bus. Settling velocity is the rate at which debris will fall through the fluid. A time-dependent average bias and a time-dependent uncertainty value for the predicted dependent variable data are determined using the normalized historical dependent variable data, and a risk-tolerance level for the on-line plant is obtained.

1459828443-e0f62685-6426-42f2-81d4-1b69a7b5492a

A seal and method of making seals utilizes folds in order to form creases in a length of material such that the creases reinforce individual seal elements or surfaces while perforations or slots in a seal edge allow air leakage from one side of the seal element or surface to the other. In the optical scanning unit, the

light passes through the plurality of holograms formed along a radial direction of the rotatable hologram disc so that a scan width can be extended without reducing a scan speed of the optical scanning unit. The support member has a bottom portion adapted to be placed adjacent to the bar, a top portion extending upwardly from the bottom portion, and a hook protruding from the bottom portion. The assembly components contain ionomer material which can be perfluorinated or non-perfluorinated, high temperature, hydrocarbon, and the like. The first and second cooperating interlocking structures include a tab-recess arrangement in which a plurality of tabs are engageable within respective recesses. The circuit that provides the fill-in clock pulses is able to detect a request for analog data acquisition, synchronously stop adding fill-in clock pulses, and track the request for data acquisition.

1459828444-22dce24b-e85e-4de9-abb4-30e17f867668

A measuring apparatus includes a spectrum analysis unit having an input for receiving an input signal to be measured. Each of the stringers has a stop for preventing said slider from separating there from at each of its ends and the stringers are free to separate from closed position at the first end when a force is applied in a predefined direction adjacent to the first end. The running level model has a hierarchical structure with various running levels such as synchronously clocked levels, a user level for system exceptions, an event-controlled user level, a time-controlled user level, a sequential user level and a cyclical user level.

1459828444-36cc1800-0b74-430c-a4e3-f8c6f11ed347

Methods for removing sulfur from a gas stream prior to sending the gas stream to a gas separation membrane system are provided. A kit for coloring hair comprises the hair colorant composition. The plurality of UBMs and the plurality of metal bumps are allocated with an overlay offset, with at least some of the plurality of UBMs being misaligned with the respective overlying ones of the plurality of metal bumps. The system further allows the granted bandwidth to be shared by more than one source in a multiprocessor system. A first aperture is interconnectable to the end of an endoscopic device and provides operative access to endoscopic instruments contained therein. In order to vary the internal width and girth dimensions of the ball portion of the chamber, a width adjustment pad of a desired thickness and/or hardness is removably connected with the bottom surface of the ball portion of the insole member, thereby to permit the user to customize the fit of the shoe.

1459828444-3c960deb-e1d6-4cc0-8432-562dc78f7d84

Methods and apparatus for providing uninterruptible power are provided by aspects of the invention. This invention also provides processes for preparing the amorphous form and pharmaceutical compositions including the amorphous form. Registration information is transmitted from the first computer, via a transaction mediator, to a computer database that resides on a transaction repository server, all of which are networked together, to establish a registered voter.

1459828444-947947cc-7a68-4dc5-b4c2-ac3414794116

By recessing portions of the drain and source areas on the basis of a spacer structure, the subsequent implantation process for forming the deep drain and source regions may result in a moderately high dopant concentration extending down to the buried insulating layer of an SOI transistor. In a hybrid data storage system, at least one first data storage cluster is configured to store data and has high data storage capacity; and at least one second data storage cluster is configured to store data and has lower data storage capacity than the first cluster. The supporting surface defines two light guiding holes. The computer identifies a preceding snapshot. This hybrid maize plant is characterized by yield stability at low to moderate yield environments and a light green color phenotype. The forming includes drawing a fiber preform derived from the spiral structure.

1459828444-b1b27bfe-6ff4-45fb-9e12-6e7f824b1e2c

A game system generates an image from a predetermined viewpoint of a game region and an object for operation by a player on a screen of a display device. Each bank is logically divisible into at least two different sections of memory cells during a refresh operation. Quasi-particle interferometry is a tool for constructing topologically protected gates. Attributes in a relational directory may be exported out of the relational directory to a hierarchical directory.

1459828445-918cda33-ee05-410d-b3c1-b66872f5a312

A lateral airbag device for a vehicle includes a head airbag which, in the event of an accident of said vehicle, provides impact protection for the head of the occupant of a vehicle. The present invention also provides methods for the production of custom vaccines, including multivalent vaccines for the treatment of immune cell tumors malignancies as well as methods of treating immune cell tumors using custom vaccines. In each iteration, representations of at least some of the exchanged messages are stored. The incident light can be switched in two directions and obtained as the transmission light and the total reflection light.

1459828445-ce48341d-2550-4494-8c6c-b98718bf2451

The present invention provides a road condition management system that can grasp an accurate state of a road condition and reduce a burden on a checker. The dovetail design comprises a rotating blade curved axial entry dovetail having a four hook profile and a rotor wheel dovetail slot sized to receive the blade dovetail. The aspherical LED lens has a radially symmetrical structure with respect to the central axis. Author-generated document classification information is analyzed and assigned a first taxonomic noun to characterize the document.

1459828445-dc14faad-a782-4395-b453-ad7755159c07

An improved process for the preparation of codeine from morphine comprises the steps of a) reacting morphine with a methylating agent in the presence of a hydrocarbon solvent at a temperature of 100 to 215 C. For this purpose, the device compares the sensor signal to a first comparison level, and an idle state is ascertained if the first comparison level is undershot. The sensed current is derived from a variable impedance controlled by a sense amplifier coupled via a current feedback resistor to the common output node between a high side power switching device and a low side power switching device of the converter. In response to receiving the proximity data indicating that the mobile device is proximate to the user, the processor may identify a position of the mobile device in relation to the user using the acceleration data. Besides, the sliding movement range defines a pointer movement frame.

1459828446-dfe9d446-1844-4b33-b697-f7b7fc73e318

Mechanisms are provided for replicating transactions at a source database node on a target database node of the data processing system. The tunable laser produces a laser beam tunable over a range of different frequencies. The transition portion optionally provides a buffer zone, or transition zone of air at a greater spacing from the water barrier. The outer facing surface may likewise be encapsulated and secured to the encapsulation of the inner facing surface. A user can insert a doll simulating a human baby into the doll-containing portion; via one of the side abdominal openings; and push the doll through the secondary opening to simulate childbirth. A host processor recognizes the communication quality on the basis of the bit error rate thus counted.

1459828447-4d067ffc-94ae-4453-88c9-8fbf93e5bd3c

The present invention relates to a surgical lamp comprising both a first light source and a second light source, where the first light source is capable of emitting light across a broad first spectral range and the second light source being capable of emitting light having an emission peak in a narrow second spectral range. Upon selection of a displayed target object by a user, a pop-up menu appears

containing a \u2018Set Attributes to. Certain embodiments implement communication systems and methods that translate text between two or more languages. A database is searched in accordance with the Raman data set in order to identify a known Raman data set from the database. In addition, the device comprises an improved handle portion which enables the physician to quickly and easily apply suture.

1459828447-66bec659-e725-4752-a498-9b33df784ed2

A concentrated, homogenous, stable, water-soluble fertilizer suspension comprising: water-soluble mineral nutrients of at least nitrogen, phosphorous, potassium, calcium, and magnesium; and an organic stabilizing additive; and wherein the pourable, aqueous suspension has water-soluble mineral nutrients amounting to at least about 80 percent by weight of the suspension. Integration may occur with Lightweight Directory Access Protocol, an operating system authentication, custom account repositories and others. The system includes a frequency converter that is located external to the compressor housing and a frequency decoder that is positioned inside the compressor housing. The present invention assures that encrypted broadcast content is delivered to only authorized devices, allowing authorized remote devices to receive encrypted broadcast content while preventing unauthorized remote devices from doing so. Each process is assigned a Universally Unique Identifier that uniquely identifies the process no matter the computing device on which it runs. The fuel H<sub>2</sub>O oxidant mixture is brought into contact with a catalyst composition comprising a dehydrogenation portion, an oxidation portion and a hydrodesulfurization portion, resulting in formation of a hydrogen-containing gas stream.

1459828447-762c4754-3bd7-4be0-930d-18b80a428c67

An immunochemical assay device for determining the presence of NT-proBNP alone or conjunctively with Cardiac Troponin I comprising a base member, an array disposed on the base member, and at least one assay indicia zone. The processes are executed in order scheduled by the scheduler by concentrating on a specific core processes obstructing the consecutive execution such as an external interrupt and an internal interrupt. The switching processes can thus be carried out, at any time, by an appropriate choice of interval beginning and interval end, whereby a free-wheeling arm for both current directions permanently exists, the only requirement being the creation of a current interval for each phase in multi-phase systems. Furthermore, a holder combined connector has a connector housing 102, and a front holder 105, the connector housing 102 has a resilient terminal locking arm 113 in a terminal accommodating space, and the front holder 105 is coupled to a connector main part 104 of the connector housing to define the terminal accommodating chamber. A session is established for carrying the page mode message by message session relay protocol.

1459828447-b6cba337-8168-46b8-85b8-38d9b9367bbb

An electrical switch for electrical tools having an electric motor operated by a DC voltage. The methods and algorithms of the invention utilize population models that incorporate genotype information for genes encoding drug metabolizing enzymes for one or more compounds of interest. During a trading period, the eVWAP price is therefore determined from not only trades, but also unmatched bids and offers. A comparison relationship between the calculated regression values and the sample measurements is defined and optimized, wherein thickness of each layer is an optimization variable. In one embodiment, the droplet has an optically curable liquid adhesive that is polymerized under exposure to UV light. The payee may open an online account or identify an existing online account to complete the transaction as well as provide identity confirmation for the payor.

1459828448-53e3e145-9921-4ad5-af18-d5c9dd62ed8b

Manipulation of elements in a graphical user interface is aided by allowing the graphical user interface to treat certain mouse button actuation and releases as holding the mouse button in an actuated state. This viral agent is effective to

elicit an immune response in a chicken to very virulent strains of Marek's disease virus without causing a significant degree of pathogenicity in the inoculated bird. As such, when cutting objects from the left or the right, the angle and orientation is selectable by an optimal push button direction, the structure of present invention thereby increasing art design knife utility and, furthermore, enhancing their industrial practical value. The transfer station can include a pre-process station configured to identify and/or align the microelectronic workpieces. Therefore the device can fabricate a large number of inexpensive high-density microarrays.

1459828448-65633466-07ae-415b-bbed-6d4b3d5c4c70

The invention provides a method of disabling malicious or unwanted software on a computer system using a plurality of rules, wherein the plurality of rules automatically disable functions originating from malicious software. A wire or other conductive lead is connected to a circuit in a manner that makes the connection more resistant to mechanical stresses such as movement or rotation of the lead relative to the circuit. The method then determines whether the TBMs of both the volume x and the child volume are set.

1459828448-d71fc714-a658-496a-92a0-ce00a75c9ebb

Disclosed is an exhaust valve capable of correctly opening/shutting an exhaust port of a cylinder based upon variation of the flux density of an electromagnet. A receiver circuit includes a differential input having a first and second input link, a differential output having a first and second output link, and first and second switching elements in electrical communication with the input links and the output links. The pan is formed by four sides each of which is integrally defined by a web bridging the width of the frame, an exterior flange projecting outwardly and an interior flange projecting inwardly with the pan held in place by adhesive between the exterior surface of the frame and the exterior flange and between the web and the corresponding surface of the frame.

1459828448-f349b747-21dc-4a4e-8450-f0bf561a4ee2

An energy supply device for a mortar fuse includes a housing, a driven rotary shaft including a cylindrical shaft surface rotatably disposed in a stationary cylindrical bearing surface in the housing, and a fan connected to the shaft for rotating the shaft in a single direction of rotation in a speed range of 30,000-50,000 rpm. The system of microwave transmitter and receivers are scanned around, and can also be positioned up and down the axis of the patient's head. The image material is printed during a temporally successive relative movement, occurring in the x and y directions, between the inkjet print head and the sheet carrier. The position wherein brake block and object make mutual contact, when a braking force is exerted which exceeds the spring force. In this way, data setup and/or hold times may be improved. The motor is provided with: a stator having cores and coils; a rotor having permanent magnets arranged in a ring shape on the radial inner side of the stator, facing the cores and coils; and a fluid dynamic bearing which rotatably supports the rotor with respect to the stator.

1459828449-262b7f64-64e2-42d3-8cec-46d6597861bb

A capacitor assembly has a substrate, a first conductive auxiliary layer on the substrate, a capacitor dielectric, a second conductive auxiliary layer and a contact electrode. The conductor width of at least one of the coil conductors provided inside the non-magnetic body sections and the coil conductors provided on both main surfaces of the non-magnetic body sections is greater than the conductor width of the other coil conductors in the laminated body. The resource policy indicates that a network resource manager associated with a wireless communications network is authorized to use the resource policy to control the resource usage of the mobile device to support a resource threshold level of the wireless communications network. A partition is formed in the center portion of the cavity of the body member to divide the cavity into two sub-cavities. Furthermore, an

access doorway is disposed over the processing stations to facilitate jam clearance. The structures can include a mixture of copolymers, for example, collagen and glycosaminoglycan.

1459828449-3d0e214e-51ea-47e8-b002-01c751061c48

The invention relates to very small-sized color image sensors. A tracing-result collation processing unit collates the optimized tracing result and a time chart as a basis of a sequence processing for an external apparatus and detects shift of the optimized tracing result. The method is characterized by the use of presses positioned one after the other.

1459828449-3f225c62-3737-4620-b025-f37e1b727826

An energy management system and device for use in an automotive frame, rail, or other structural component of an automotive vehicle. The method for synchronizing the animations includes setting attributes of views independently with each view being associated with a process. A display member is coupled to the strip and is viewable through the storage tube.

1459828449-a2152869-14ad-43e2-87aa-a8925325b02f

An IF signal output from an IF amplifying circuit included in a tuner is converted to have a band width for transmission by an SAW filter and has unnecessary signals removed therefrom. Disclosed and claimed are antineoplastic compositions containing cocoa polyphenols or procyanidins and methods for treating patients employing the compositions. A coupling piece is movable mounted in housing and is supported movably corresponding to the driving movement transmitted from driving shaft of the foot care apparatus.

1459828449-de3f2f52-1e75-4398-a53a-c9664b657ece

A portable structure supports a subsurface imaging system and is moveable over a given imaging site. In the disclosed embodiment, the integrated function member is provided as a lever-type structure that constitutes part of the access door assembly by means of which access is gained to the fastener drive track along which fasteners are fed to the driving portion of the tool. The ultrathin film of calcium phosphate crystals can be coated on the surface of the solid substrate while substantially maintaining surface roughness of the solid substrate. Each of the pull-down transistors is the other type, p-type or n-type. The invention is characterized in that said molding tools have pairs of respective conical support surfaces, through which the tools are centered and aligned with one another, each support surface being formed by a portion of tools deprived of transverse mobility. Further, the micro lock valve needs relatively low electric power to drive a number of the micro lock valves, and decreases noise due to an operation thereof.

1459828450-44aba1d3-4f59-4f93-9f4c-91a72949e581

A particular system includes a processor and memory storing instructions that are executable by the processor to cause the processor to perform operations. The invention is characterized in that said optical source comprises a light source emitting simultaneously in said plurality of emitting wavelengths. A modularized component assembly for an inflation syringe allowing independent components to be tested independent of the other components of the inflation syringe.

1459828450-8aee3668-4991-42f0-92e6-504ce5de37af

A lid mechanism includes a divided lid for closing an opening extending in a longitudinal direction in a closed position, and a lid operating mechanism disposed below the opening closed by the divided lid. The peripheral wall is formed with an aperture. Connected to the core logic, the first CA logic block uses a first CA function associated with a first CA provider.

1459828451-0a8834ef-ec2a-423b-be22-c4a6fba06ade

A three level nestable stacking comprising a base, a pair of opposing sidewalls, a

pair of opposing endwalls and at least two bail arms. A brake stroke sensor includes a force-receiving plate, a second plate movable relative to the force-receiving plate, a spring disposed between the plates and operatively connected to the pushrod, a strain gauge bridge mounted on the force-receiving plate and a microcontroller capable of converting the strain gauge bridge signal into digital data. A protruding end of the pin has an axially adjustable holder mounted thereon for releasably and tightly suspending a fractional weight therefrom, between two spaced flanges secured to and radially extending from the pin. A radio transmitter front-end generates a transmit signal based on the filtered up-converted signal. During the copy-out process, pixels are converted from YUV format to an RGB format.

1459828451-8042f120-227e-4fae-9848-f94c51220c35

The plant contains high temperature fuel cells which form a battery in which electrochemical reactions can be carried out with a fuel and a gas containing oxygen while producing an electrical current and a hot exhaust gas flow which transports waste heat. Before the first step, the airbag is folded through a preliminarily-folding step to fold back a front edge side region to the vehicle body side wall along a folded line in a transverse direction. The top ring may be adapted to apply a liquid displacement force to the membrane in a direction perpendicular to a plane of an aperture of the inner ring to cause a change in a radius of curvature of the membrane. The cable is coupled to the first metal element. Then, each resinous interface is driven through the respective fibrous layer to impregnate the fibrous layer and form a dense, resinous layer between each fibrous layer and adjacent polymeric layer. The automated solar cell fab is generally an arrangement of automated processing modules and automation equipment that is used to form solar cell devices.

1459828451-f0f535b4-7b95-43fa-8b1f-19d04f035025

The presently disclosed and claimed inventive concept relates generally to liquid-based coatings for writable-erasable surfaces, products that include such coatings, and methods for making and using the same. A portable cart is included with a chamber for storage of a plurality of mattresses. The implementation can track one or more columns in the physical tables that are used by the active view and identify a change to the physical tables in a transaction log of the database. If the intermediate device does not receive at least one of a receipt indicator or one or more subordinate supplemental receipt indicators before the expiration of the timer, the intermediate device sends the generated supplemental receipt indicator to the next superordinate device. The screening center provides an interactive system for determining whether a subject has encountered or handled a substance that may pose a potential threat, e.

1459828452-08090a13-0782-442a-896c-648e85ae5bb2

Access to a bus is granted to one of a number of requesting communication circuits that each submitted a bus control request during a request period of an arbitration period in response to the entries in a priority table. The monitoring device measures an aggregate current supplied to a plurality of components of the HVAC system and transmits current data based on the measured aggregate current. The first contact pattern and the dummy gate pattern define upper and lower electrodes on the variable resistance pattern, respectively. Additionally, the deckboard may include a locking channel configured to couple to the j-shaped upholstery channels. A method of making a pipe that includes selecting a polymer composition having a substantially single peak in the LTD curve is described. One end of the pin penetrates the guide groove while the other end of the pin engages with the stopper portion.

1459828452-418333c2-eb43-4fe8-a163-aa22fae5019a

A light reflected from a semiconductor die is used for enhanced control of substrate removal from the die. The method includes: a 3rd Generation Partnership Project network entity sending outer Internet Protocol packet header information to

a Broadband Forum access network entity; and the BBF access network entity scheduling a data packet matching the outer IP packet header information according to a Differentiated Services Code Point of the data packet. Rearward protruding wiring flanges provides support for low voltage wires and cabling. A collimator constructed of a radiation attenuative material is arranged on the side of the detector facing the object. Further, a fibrous product is described incorporating encapsulated long persistent phosphor particles.

1459828452-e910476d-2c90-414b-a3f1-8bb802a1c3d3

Messages can be sent to a pet using a hand-held remote transmitter and a receiver that is attached to the pet. In one embodiment a computer machine is configured to receive a query as computer machine input, automatically determine at least one concept contained within the query and automatically normalize the at least one concept contained within the query, thus creating at least one normalized concept. By comparing the selected segment of the expression pattern with expression patterns of a group of candidate genes or the like, genes having an expression pattern with at least a partial similarity are searched from the group of candidate genes. The distributed service creation and execution environment enable the generation, provisioning, and execution of applications across private and public telecommunication networks in order to provide novel telecommunication services via the serial or concurrent invocation of one or more distributed applications. The light homogenizing relay device makes at least one copy of the light beam, and delivers the light beam and the at least one copy to a light receiving surface of the input coupler, thereby effectively creating a larger input beam while retaining the angular spread of the initial light beam. The variable viscosity fluid is responsive to the application of an electromagnetic field to exhibit increased rigidity in the presence of the electromagnetic field and reduced rigidity in the absence of the electromagnetic field.

1459828453-a13523ce-0f3f-4d6c-a6fa-22cca2b5e71a

A 6F2 memory cell structure and a method of fabricating the same. Performance information associated with a network service is collected from multiple service monitoring points. In this way, a network may use the locally stored CSG subscription information for a given access terminal to determine whether to allow that access terminal to access an access point in the network. The multiplexer selects a stage based on a branch indicator, an instruction wrap indicator, and a carry indicator. Thus, the use of such materials in the context of a front electrode of a photovoltaic device reduces light reflection due to the high refractive index, and increases transmission into the active semiconductor film due to the higher transmission characteristics thereof, thereby improving the efficiency of the device. Additionally, the system supports and augments a convention being held in a physical or venue-based center.

1459828453-cedb46a3-59be-421d-8541-8a46af839f81

In one embodiment, a voltage-controlled oscillator is provided having an output signal having a frequency responsive to a tuning signal. Each range for a particular pilot may be a default range, may be entered by the pilot and/or may be automatically determined from experience and may be subsequently edited by the pilot to change a range and to add or delete parameters describing a situation for which a display should be provided. The tool computes specified business metrics representing business measures of quality reflected by the model. In yet another embodiment, fluid and/or electrical conduits are mounted to an outer surface of the door liner. A nozzle extends from the substrate at a spaced apart location from the actuator support and the heater. A major portion of the fluid flowing over and rearwardly of the upper wall is reversed and captured due to internal and external pressure differential in the chamber to reduce drag, and simultaneously act against rear surfaces of the dynamic surface element to define a propulsive force assisting movement of the body.

1459828454-1cb0c8e9-6c91-4574-bb22-5b567037defb

The present disclosure is directed to systems and methods for a multiport connector assembly, used in telecommunication systems, that is designed to reduce electrical port to port crosstalk noise. The carriage guide can be functionally linked with the gear mechanism of the spool. The differential signal is converted into a digital signal by an AD converter. A pulling device is attached by a line to the roller quadrant. The electronic circuit includes a circuit sequentially controlling the current of each of the phases producing automatic switching of powering sequences of the phases on the basis of the absolute position of the reduction unit output shaft.

1459828454-44a19423-9c07-44cb-85d5-dc5bfdcfbd50

The present invention concerns a powder metal composition for producing powder metal components comprising a Co-based pre-alloyed powder, with irregularly shaped particles comprising at least 15% by weight Cr and less than 0. The first operation may restore system state and basic operational data to a system sufficient that the system may begin performing a set of basic operations. The first FET and said second FET are approximately equal sized FETs.

1459828454-f422bdc8-b572-4a83-a783-c66ce46c1eb2

One or more RFID tags are integrated into a fire hose to facilitate an individual's exit from a structure. The ultraviolet irradiation unit is supported by the X-axis driving mechanism on a rear side. This is made possible by operating with a pre-computed frequency focusing matrix that transforms the data from various frequency slots that are spread across the entire wideband region into a common narrowband frequency for the array outputs. The microneedles are formed with one or more channels of a certain dimension such that passive capillary flow drives a flow of the drug compound. The line width of each alignment mark and the gray level in each pixel column of each gray level portion is measured and analyzed to produce a local tone reproduction curve for each pixel column and associated line width. The intermediate layer a composite of at least two dissimilar materials that is radially oriented and transversely isotropic so that the layer provides unique performance properties when the ball is struck with different clubs.

1459828455-45f4f0d6-fd4b-4527-81a0-c0ed38c4839d

The present invention relates to a bipolar battery having at least two battery cells comprising: a sealed housing, a negative end terminal, a positive end terminal, at least one biplate assembly arranged in a sandwich structure between said negative and positive end terminals, and a separator, including an electrolyte, arranged between each negative and positive electrode forming a battery cell. The detection circuit includes a voltage-measuring circuit for measuring the output voltage of the piezoelectric sensor, a time-measuring circuit for measuring time, and a judging circuit configured to judge the entrapment. A swivel joint is connected to the mounting strap. The written compressed image data is changed in sequence. The PMGD has an average pore size, pore density and thickness that are optimized to control the flow of the gas at the desired flow rate and distribution uniformity at a relatively short distance downstream from the PMGD. The first and second inductance circuits couple to each other in parallel.

1459828455-7c58728e-b837-4205-a179-4b63603ea1d3

In general, the present invention provides a computer apparatus, power supply control method and program for reducing the standby power requirements in a computer supporting a wake-up function. Sequencing numbers are added to the headers of a plurality of data packets which are transmitted over a plurality of data transmission paths. Otherwise the cache mechanism creates a local cache file and satisfies the request from the server, and also fills in a sparse cached file as reads for data in ranges that are missing in the cached file are requested and received from the server. The printer is configured to print the interface onto the surface by printing the visible data and the invisible coded data substantially

simultaneously, using the printing mechanism, in response to actuation of the actuator.

1459828455-9742183b-cbf5-435e-92fc-f983f201a0ae

A surface cleaning apparatus includes a housing with an on-board reactive oxygen species generator which produces reactive oxygen species in situ from fluid stored within an on-board supply tank of the surface cleaning apparatus, and further delivers the generated reactive oxygen species to a cleaning pad attached to the housing of the surface cleaning apparatus. The fixture is adapted to secure to the base of the liner to both unlock and lower the heated liner, such as a silicon carbide liner, at an controlled rate. If the visibility is determined to be poor from information from the sensors, the driver assistance control based on the output information from the forward recognition apparatus is suspended. External terminals for host interface assigned to the other interface circuits are used for double duty to output the interface control signals.

1459828455-e5944482-9af9-463f-aa2a-056ac91c95c2

Provided is a positive photoresist composition comprising a resin which contains specific repeating units and whose dissolving rate toward an alkaline developing solution is increased by the action of an acid and a compound which generates an acid upon irradiation with an actinic ray or a radiation. At a side axially opposite from one side where an outer ring rib of a clutch release bearing is formed, there is provided a first seal member externally fitted to an outer ring to be fixed thereto. The airbag includes a left half airbag to be inflated at a front left side of a vehicle occupant and a right half airbag to be inflated at the front right side of the occupant. Various features of the methods and apparatus are disclosed. An environmental radiation monitor is also provided. Data segments in the system that are not identified or referenced in the active-data-segments set may be removed.

1459828455-e7dc853e-9cde-43cc-8f8d-69565ab6375e

Systems, devices and methods are described for determining attributes identifying media items from other media items. A method according to the present invention includes providing a bias voltage to a back gate of at least one transistor in the SRAM cell, and dynamically controlling the bias voltage based on an operational mode of the SRAM cell. In one embodiment, this proximity analysis is triggered by a detection of movement in a trailer. According to one embodiment, a plurality of discrete fasteners are provided to pass through the support device spaces and the first and second tubular structures.

1459828456-16320e86-3b81-46c4-86a8-06ce999433c7

A monitoring apparatus and a monitoring system monitor a person who removed an output sheet for a print job or a copy job from an image forming apparatus that can be used by a plurality of users. The arrangement according to the invention comprises a detector unit, a communications device, a server and a database connected therewith, and a data presentation means. The task group is assembled with other task groups having identical priorities in a task group queue. The routers include both working data ports and protection data ports with each port including associated transmit and receive terminals. The optical divider means includes at least one aperture extending at least in sections at a specified angle different from 0 degrees to the thickness of said optical divider means.

1459828456-84fff81a-149f-4c20-8a6e-80da3fef8ab8

A holographic HMI allows data and commands to be entered into electronic equipment. The method includes providing a continuous medium that adds a polymer material to the continuous medium. In this manner, when a high voltage is applied to a drain region and 0 V is applied to the gate electrode, the trench bottom surface lower region is depleted, thereby increasing the breakdown voltage in the OFF state.

1459828457-23e60daf-7c6d-4c69-b06c-5fb1b72c5faf

High quality factor inductor elements with dynamically driven, conductive, patterned shields are disclosed wherein a conductive, patterned shield structure layer is provided between the inductor element and the substrate. The method also includes wirelessly transmitting an identification data and/or an integrity information associated with the security seal and/or the utility meter to the external transceiver upon activating the tamper monitoring circuit or being queried by the external transceiver through a transceiver of the tamper monitoring circuit. If a target of interest is detected then an indication is provided, preferably in the form of an audible alert, allowing those nearby time to take cover.

1459828457-a1365ce0-77b9-4a66-9a40-26bf1a5e6dad

A cylinder rod with wear-resistant surface markings is provided. Motion sensors are placed in an area to be protected. The second magnetic body rotates relative to the first magnetic body to selectively locate between an initial position parallel with the second magnetic body and a target position contacted with the switch. The device further comprises a pressure sensor arrangement, arranged to detect and determine the differential pressure between the internal cavity and the exterior of the housing. Further, the digital data playing device is prevented from rising in cost due to the use of simple encryption for data downloaded to the playing device. A compound link is a link that represents travel along multiple links of the electronic map.

1459828457-c6789969-bbc9-4def-ac3f-b0dd466970aa

According to one embodiment, a nonvolatile semiconductor memory device includes first and second stacked structures, first and second semiconductor pillars, first and second memory units, and a semiconductor connection portion. The client node requests access to a resource. A sensor may be cooled by a heat sink such as a pump directing an airstream or a coldfinger. Channel tunes and the channel tune times of the normalized log data can be compared to expected air times of television advertisements on channels, and an impression values, e. The matrix section 12 comprises a first material and the light-emitting sections comprise a second material showing a eutectic relationship with the first material.

1459828457-e8af393c-49d3-47ee-8197-c4610e347463

A dynamic longitudinal connecting member assembly includes an anchor member having an integral or otherwise fixed elongate core of circular or non-circular cross-section. The power supply adapter is provided with a power transmitter for the wireless power transfer to the power supply unit. A shaft couples the mass to the rotor, with the shaft allowing the mass to move vertically up and down. The support may include a base that may include at least one first hole configured to receive a shaft for rotating the display member.

1459828458-08780d2d-284c-47dc-9999-558856c2f4d5

According to one of embodiments, taking in facial image data for a user, extracting feature points of the face of the user from the facial image data and then coding the feature points, and registering the facial image data on a destination management table so that the facial image data is associated with a special identifier and/or the coded feature points. The transport roller can be controlled such that the transport roller receives a leading edge of the original fed from the feeding means at the fixed position, i. The target object is associated with a network adaptor for a network protocol at the remote station. One pixel of an image is formed by a plurality of light spots having different focal positions in at least a sub-scanning direction. The ratio of the maximum signal power to the minimum signal power and the ratio of the maximum noise power to the minimum noise power are pre-determined based on the signal modulation format type and filter passband characteristics.

1459828458-181fa594-951c-413e-ab35-0f6fcd162cee

A method and apparatus for resizing a trunk in a network are disclosed. The radiating plate is formed on the substrate and the radiating plate has a first radiating area, a second radiating area and a slit formed between the first and the second radiating areas. The demodulator demodulates the broadcast signal, and the known sequence detector detects the known data sequence from the demodulated signal. The piston is operatively connectable to the plurality of segments and actuatable for moving the plurality of segments between a disengaged and an engaged position about the tubular. The blade member is for providing support to a plurality of cleaning members and a cleaning blade. The third doped region has the first type conductivity.

1459828458-a17858d4-eb0e-482b-83ca-454862733c13

The present invention relates to measuring devices used in measuring acceleration and, more precisely, to capacitive acceleration sensors. The attenuated type phase shift mask has a reference area allowing a light radiated from a light source to pass through and an amplitude and phase modulation area allowing a part of said light to pass through. The processor, when executing the code comprising the management module, is configured to perform the method below. Using an electro-optical waveguiding fiber in this configuration allows the voltage between two widely spaced points to be accurately measured.

1459828459-7e8eaf2c-e46b-45eb-a37c-b1b817ccfde7

An adjustable aperture apparatus on a bulk material transfer chute that transfers a flow of bulk material from a discharge conveyor to a separate receiving conveyor is automatically closed when no bulk material is being transferred by the transfer chute from the discharge conveyor to the receiving conveyor. Weight compensation means are provided for the vertical displacement, so that the drive can be at least partially relieved of the weight of the functional device. The annealing step primarily removes O and secondarily removes C and S, especially when performed under vacuum, an inert gas, or a reducing ambient such as ammonia plasma. Each of the brackets has a slot that receives a connector, the connector traveling in the slot between inner and outer positions. , by measuring the volume of nitrogen expired after end-passive expiratory switching of the inspired gas from room air to 100% oxygen during the PHA. The first reference leg includes a first transistor having a first size parameter coupled to the current source and a first diode having a second size parameter coupled to the first transistor.

1459828459-8ea10660-36a9-41ca-b157-aaf96fae01f5

A laser spark plug for an internal combustion engine includes at least one element for guiding, shaping and/or generating laser radiation, a combustion chamber window and a housing. In general, the jacking apparatus includes a jacking member which may pivotally couple to the frame of the vehicle. The connected component comprising segmentation tags of preselected image types. A third external contact element and a fourth external contact element, both electrically coupled to the second electrode of the semiconductor chip.

1459828460-063f4ad6-86da-4a51-8898-743ac010741a

Rendering electronic chart objects is provided. The system includes an image reduction system for minimizing size of at least one original image using a plurality of different reduction strategies to generate a plurality of minimized images. Shifting from one gear to another is controlled by a shift controller. User controls allow navigation among buffered designated channels during reception.

1459828460-141f5567-a374-45ec-8e6e-e066837540cf

A surgical microscopy system having an illumination system is provided. The invention is suitable for use in DWDM based optical ring networks, and in particular, in networks constructed having a logical star over physical ring topology. By substituting a post-filter and a perceptual weighting filter of a

prior art with one transcoding filter, the calculation amount of the transcoder is reduced, and speech quality decoded at a receiving end is improved. The absorbent article includes a fluid permeable cover disposed over an absorbent member. Each symbol of the two dimensional constellation is associated with a respective m bit label of the m input bits. In case of a failed acquisition, performing a second acquisition of the modulated signal as a function of a second search frequency interval, narrower than the first frequency interval, and a second reception sensitivity, greater than the first sensitivity and depending on a power of a side lobe of the modulated signal.

1459828460-7162f439-24af-4f1a-9335-404879e426f3

The invention provides a package type semiconductor device and a manufacturing method thereof where reliability is improved without increasing a manufacturing cost. Several blocks are positioned in two spiral rows on the periphery of the drum and are secured to the drum by welding. A first conductor line is placed over the semiconductor chip.

1459828460-b7f9f45a-8820-4a80-86d5-f60f95e92128

A system and method for stacking a predetermined number of nestable objects is disclosed, including several alternative embodiments. A device incorporating teachings of the present invention may include a motion arm extending through an opening in the housing of the device. At a second time, the control circuit performs first control of generating or updating and storing correspondence information. Once over-voltage is detected, the over-voltage indicator pauses detecting, asserts a high level in the indication signal, and periodically resumes detecting until end of over-voltage is detected. simultaneous precipitation, of the said actinides in oxidation states and and a fraction of the singly charged cation. Scheduling functions include full internal scheduling, calendar scheduling in communication with an external scheduler, and external calendar scheduling.

1459828461-a7c45b41-9266-49d6-aaa8-4929e4487894

This invention relates to a hearing device for compensating hearing impairment of a user. For each data set, it may be determined whether the associated paper financial item is a bank of first deposit item or a non-BOFD item. The implementation of the filter circuit is thus simplified, both making the circuit less expensive and giving it a lower power consumption.

1459828461-b564c127-b8ef-4ed4-93df-d99aa69cc86b

A query interpreter may be configured to query a model repository to obtain one or more elements of at least one model associated with a software application and stored in the model repository. The error correction circuitry performs both block error correction in a first data domain and sector error correction in a second data domain. When the handle is reciprocated, the wrench bar drives the pawls to push teeth on the toothed rod, and then the toothed rod is elongated outwards. The receiver output signals generated by the at least one receiver block is indicative of the position of the web of material as the same is moved along the travel path between the transmitter block and the receiver block. A control signal is supplied from the data processing apparatus to the memory card through the control line. In further embodiments, the traffic manager may rewrite a routing table and DNS mapping to implement the preferred source site and path as the default source site and path between the OSP and the destination prefix.

1459828461-be7ad5ca-6b55-4dd2-97f1-5f4667aa0d93

A method for generating a scalar quality metric value for a design solution includes reflectings one or more qualities of the design solution with respect to two or more domains in the system. The method includes providing a diaphragm patch ring. The hybrid yarn filament is arranged in electrical communication with itself or other hybrid yarn filaments during construction of the sleeve to provide uniform shielding against EMI, RFI, and andor ESD. A request to store or retrieve keymap

information for a data object instance may be routed to a particular computing node based on a consistent hashing scheme in which a hash function is applied to a portion of the composite key of the data object instance. The lithographic mask, along with etching processes may be used to transfer a pattern 450a into a layer of a semiconductor device.

1459828461-f520006e-0d25-42fa-9a55-befd66be378d

Systems and methods are provided for offset correction of images from a flat panel detector. Channel components at known OFDM symbol locations are interpolated to other OFDM symbol locations. The web is folded and shaped into a package with a header which includes the semi-circular perforated pattern and the lines of perforation. To perform the translation, the management application identifies the vendor of one or more devices that are affected by the zone control command.

1459828462-13e300e9-b5dd-4747-a5f0-1d925a6e8fab

A policy based service aware engine is provided to dynamically and/or statically provision a traffic navigation processor at a visited network according to service profiles of the home network. These are either separate substrates or a unitary substrate. Alternatively, a switch from n-pass to m-pass mode may occur during a printing operation but with a uniform print medium advance throughout.

1459828462-3d072830-2883-4daa-aea9-cba629497275

The crosslinked material of the present invention is obtainable by crosslinking a propylene resin composition through irradiation with an ionizing radiation wherein the propylene resin composition comprises 100 parts by mass of a propylene resin comprising 15 to 99% by mass of a propylene polymer having a melting point, as measured by a differential scanning calorimeter, of 120 to 170°C. The pigment dispersion solution includes a colored pigment, a dispersant, a binder resin and a solvent, and further includes particles of white pigment. The composite sheet provides a barrier to air and liquid water infiltration while having high moisture vapor permeability and good thermal barrier properties. In maintaining the sleep mode, the processor operates such that all input signals that request the handheld computer to power up remain active but so long as the battery voltage remains below a predetermined voltage the interrupt signals to power up selected applications and devices are masked.

1459828462-a6d03fee-3d84-4856-b7ed-4073954c0a4c

The invention relates to a device for supporting and stabilizing an injured person. The polyurethanes are particularly useful for personal safety equipment and in the construction of automobiles. Image data is constructed based on signals received by the probe and a time-intensity curve is generated from intensity values of the image data. In the subject methods, dry reactants that include calcium and phosphate sources, as well as a monovalent cation dihydrogen phosphate salt, are combined with a setting fluid and the combined reactants are mixed to produce the settable composition. The higher of the two pressures determines the position of a 32 directional control valve which separates the collector line connecting all air spring units from the air pressure accumulator or which connects it to as small a chamber volume of the supply system as possible. The security level needed may be determined based on whether the entities are in the same network or in different networks and/or on the information being transmitted.

1459828462-fd0700f2-a184-42dd-9b3d-d0d27401fb15

Methods of forming a write pole are disclosed. The apparatus comprises, generally, an anode, a cathode, and a selective anode shield material flow assembly. The orbital bonding tool head in turn supports via a novel parallelogram linkage an ultrasonic transducer having fitted therein a downwardly protruding ultrasonic bonding tool, the parallelogram linkage enabling the tool tip to be displaced only vertically in response to reaction forces exerted on the tip in translating the tip downwardly into contact with a workpiece. The area underneath the intermediate

section and above the bottom of the trailer defines a storage area that is not blocked or limited in size by the width of the chassis beams. The coating is composed of at least one layer comprising a cubic c-N-phase without a co-existing amorphous phase.

1459828463-262057de-1836-4c7f-b7d4-68a807a0ba14

An improved intermediate scaffold joint comprising a frame, a first mounting member, a second mounting member, and a vertical stub. Die cutting and matrix removal steps, all carried out in-line in a single pass, produce a multiple layer label. Each segment of the image, as defined by the tile delineations, is sent separately to a data processing unit for processing. When a monopole antenna is used in place of the loop antenna, by combining this with a wire-shaped conductor orthogonal to this, it becomes possible to receive a circular polarized wave by a configuration providing a power transfer part between the two. The third item of data is compared with the first item of data and the second item of data. The movable assembly includes a second magnetic field generator and two guiding holes.

1459828463-5fcb157d-9266-416c-a72b-65cb972d97b5

Described are diol-derived organofunctional silanes in which the silanes contain cyclic and bridged alkoxy groups derived from hydrocarbon-based diols and methods for the preparation of the silanes. The end user can grow the plant in his own way while checking the growth progress on the image even from a remote place. A test device is maintained by the controller, and has a predetermined criteria which determines whether the input signal should be sent on to the controller or not. A Peltier module is fixed to the bottom plate. Die analysis, including, for example, critical timing path analysis, is enhanced by this ability to controllably heat the die. A match with the stored password indicates authentication.

1459828463-65178f34-d052-4a03-941d-a4b5144105c3

A crystallization apparatus includes a light modulation element, and an image forming optical system that forms a light intensity distribution set based on light transmitted through the light modulation element on an irradiation surface. The photo analyzer can then create stacks of the similar photos and determine a representative photo from the similar photos in each stack. Network alternatives may be provided for establishing the second call in response to determining that the quality of the first call is degrading. At least one tie bar is attached to and extends between the die pad and each of the outer and inner dambars. Stencil apparatus can be used to create a design on the tooth using a covering compound.

1459828463-a5cda64a-f1f7-49a8-8956-d3fd72ecba76

Method and apparatus for implanting radially expandable prostheses in the body lumens rely on tacking or anchoring of the prostheses with separately introduced fasteners. The disc-shaped body has two concentric or coaxial recesses defined therein. Tensile stress in a center layer of the film is reduced by increasing N<sub>2</sub> gas flow to the nitrogen plasma, resulting in a Ti:N stoichiometry between 1:2. The training sequence generator further includes a symbol generator to generate a plurality of training symbols satisfying a predetermined constraint such that the training symbols are insensitive to synchronization error and a training sequence forming unit that forms the training sequence from the training symbols generated by the training symbol generator. A method and computer program for performing conditional execution are also claimed.

1459828464-13300708-f26c-4cf3-a18a-19029c68ffba

An indium oxide based material containing carbon, and a method for preparing the same are provided. The walls of the inner pouch are composed of an ultra-thin, heat-sealable film impermeable to body wastes comprising a plasticized biodegradable polyester or copolyester externally covered by a soft, porous, water-disintegratable cover layer of biodegradable and water-dispersible fibers. The coils in the respective active parts are connected in series or in parallel.

Advantageously, the imaged base coat can subsequently be coated with a top coat or stain to modify or enhance the properties or appearance of the design.

1459828464-640f92fd-7a63-4aba-a2a8-b3b02aa9e9f4

An object of the invention is to provide an optical disc in which the influence of recording interference is reduced to make it possible to narrow the interval between adjacent recording tracks and increase the recording density of information. Responsive to determining that a bookmark record including the URL does not exist, an address and a network type for the URL can be determined. To maintain the focal point inside the lamella, the bubbles that result from the photodisruption are measured using a wavefront detector.

1459828464-c479c98a-1f0d-432a-a6fc-9093b21d4510

An article and method for controlling the sign and magnitude of dispersion forces, such as the Casimir force. The items may include upholstered or non-upholstered sports stadium chairs or other soft-covered items such as leather jackets or golf bags without detracting from their appearance, even if the panel is removed. At ambient temperature said compound containing reactive hydrogen is a solid material, a powder, a granule, a flake or grind or a mixture thereof which is preferably ground.

1459828464-d62e4445-f79e-478e-9ddd-2c3cab755e01

A unit and method for remotely monitoring and/or controlling an apparatus and specifically for remotely monitoring and/or controlling street lamps. The object of the present invention is to mitigate the effect and to prevent damage caused by the lack of strength in thinned semiconductor substrates. The piston divides the interior of the housing into two fluid-charged chambers. In one embodiment, the pressure at the secondary structure is less than one atmosphere over all diameters of the moving recording medium. The compositions which harden into highly resilient solid masses having high strengths are basically comprised of a hydraulic cement, an aqueous rubber latex, an aqueous rubber latex stabilizing surfactant and silica hydrophobicized with silicon oil.

1459828464-e8900c36-00d0-4e44-acae-77a2f3e6ea5e

Five electronic control units control vehicle devices using CAN protocol. The state machine generates a state signal indicating a state of the IO interface in a next clock cycle. A connecting strap preferably extends circumferentially around the first and second bodies and releasably secures the first and second bodies together when the first body is in the first position.

1459828465-0a63acfb-663f-42f0-9db0-a65f03f704e5

A polyimide resin composition comprising a polyimide resin and at least one 1H-tetrazole selected from the group consisting of 1H-tetrazole, 5,5-bis-1H-tetrazole, and derivatives thereof, and having an excellent rust preventing effect on copper and copper alloys. In some embodiments, the molecular profiling can be used to identify treatments for a disease, such as treatments that were not initially identified as a treatment for the disease or not expected to be a treatment for a particular disease. The wings can take deformed-deployed configurations when the winged body is towed at a relatively high speed through the water.

1459828465-a57e62d1-ccbe-45c9-b393-3436d3a41f08

A radio frequency identification tag is coupled to a circuit board to track the specific operating and environmental conditions of each manufacturing stage as the circuit board passes through the manufacturing stages. The arrow shaft provides an accurate and easy fletching thanks to fletching indication patterns formed on the outer circumferential surface of the arrow shaft body, and also provides an easy aligning of fletchings to any position of the arrow shaft body with the fletching indication patterns depending on characteristics of users. The alternate feedwater injection system includes a water storage tank, an injection point into the primary

system, a pump capable to transfer water from the water storage tank to the injection point and ultimately to the reactor core.

1459828465-cd2d9851-b054-439c-a47c-8fddd12e809c

An image forming apparatus 1 comprises a toner cartridge, a display portion 33 for notifying a toner near-empty, storage portions 34, 37 for storing, as data, a toner amount housed in a new toner cartridge, a toner consumption amount when the toner cartridge is used and operating time of the image forming apparatus, and a control portion 31 for executing a program for notifying a toner near-empty. The piston cooling device is provided with a piston for an internal combustion engine, in which a circumferential passage and a cooling passage having an inlet passage and an outlet passage are provided, and an oil jet for injecting oil from an injection port to the inlet passage. The invention also provides antiseptics that are useful as general surface disinfectants and sterilizers, fluid disinfectants and biocide preservatives. The information handling system can also include a UPS controller coupled to the power circuit.

1459828465-dcd0bc28-5495-45dd-891b-9496dfc4393d

Dynamic generation of target files is described. To help expel the material from the barrel, the syringes of the invention include sealing means that are configured to seal the stem of the plunger to the barrel. The cloth may have a first configuration wherein the cloth is retracted substantially into the cover member, and a second configuration wherein the cloth is extended substantially out of the cover member without becoming detached therefrom. A second TEOS-03 film having a relatively small water content is formed on the first TEOS-03 film through second TEOS-03 CVD where the ozone concentration is relatively high. The synthetic jets are arranged within the lighting system such that they are secured at contact points. The first and second results are then combined to substantially remove the offset error.

1459828466-7b4ecdaf-933b-42fe-8203-047e8a51c56d

A method and device provides features for the temporary \u201cparking\u201d of sutures with respect to a cannula. In particular, the present invention includes a pre-transmission processing module which is structured and configured to generate a partially processed signal. A first memory device is coupled to the processor for storing the digital signals representing the pump motor operating parameters. The airbag further includes a connecting member for connecting the left half airbag and the right half airbag at facing portions thereof.

1459828466-8c9a22fd-57c0-45cf-968e-9255d97ae69f

The present invention describes novel, cost-effective and rapid processes suitable for recycling and degradation of specially designed plastics, which are instantly degradable synthetic polymeric plastics having the characteristics and properties of conventional forms of plastics. In one embodiment, a boron doped diamond cold cathode is formed into the cantilever with an associated accelerating electrode and secondary electron collection electrode. This bit string or a compressed version of this bit string is transferred in real-time over a management channel to a first central processing unit in a network node where the bit string is compacted or processed.

1459828466-a0237461-8b66-415c-ae2e-9677ee19a705

On the front surface side of a cooler, a filter mounting portion provided with a filter abutment surface with which a filter is brought into abutment from the front side of the filter mounting portion is provided. The control system also includes an actuator control module that regulates an engine speed based on a desired idle speed when an engine idle mode is enabled and a balancing module that balances torque produced by cylinders of an engine based on the engine speed signal when the engine idle mode is enabled. In one embodiment, an imprint is created by a person stepping onto a foam member.

1459828466-ada9367e-2c03-444f-83f3-2edc577e361f

The present invention discloses a composition of a stable suspension of a poorly water soluble pharmaceutical agent or cosmetic in the form of particles of the pharmaceutical agent or cosmetic suspended in a frozen aqueous matrix and method for its preparation. Additionally, the apparatus can include a high efficiency pressure controller for controlling the output of the vacuum pump. In the preferred embodiments, elements of a same precoding matrix for antennas of same RRH are all zero or non-zero. An upper member in the fluid-metering assembly can be moved to stabilize, steer, and change TFA within the drill bit.

1459828466-b467a505-0574-4da9-80a0-502a42d0747a

The present invention relates to a locking system designed for packages intended particularly for packing make-up comprising refills without the use of adhesives. The vehicle has a rear frame section with two wheels that is connected to the front frame section such that it can tilt. In one embodiment, each of the elements comprises a center part and peripheral part having a higher refractive than the central part.

1459828466-b9a6130f-7ea3-463b-9341-4d632a0e8c99

A coating such as liquid milk chocolate is applied to articles such as confectionery bars. A fuel assembly comprises spacing grids comprising cells formed by orthogonal crossing plates. A dielectric layer and an upper metal layer patterned using the same mask are provided on the lower metal layer.

1459828466-d0eda8cf-9af0-4c7a-80a7-75b04fa68ce2

A method of manufacturing a printhead assembly for an A4 pagewidth drop on demand printer includes a number of printhead modules situated along a metal channel. , with said contactor performing the contact in liquid-liquid counter-current between a heavy phase and a light phase, with said heavy phase being able to be either an oil-rich phase or an alcohol-rich phase. A guide opening extends through the cross member.

1459828467-36b8443c-26c2-4ec4-95f5-9fda5a929be1

A cover restricting mechanism is adapted for use in a foldable electronic device. Other schemes include a rear-addressing scheme which uses a retroreflecting surface to enable greater viewing angle and contrast. The macro data includes a set of execution entries, each of which includes data for a user interface task for a user interface object and a time for the user interface task. The computers replicate the objects in the directories and update the individual linked values of the attributes. The control system configures the impedances between the sensing electrode and the shield electrode, is configured to measure current to the sensing electrode in each configuration, and is configured to calculate a measure related to the impedance from the sensing electrode to ground.

1459828467-4f73a6b8-f57f-4bae-b275-78c9594688dc

Provided is a process for adsorptive separation of p-xylene from an aromatic hydrocarbon mixture comprising other isomers of xylene, and a device used therein. The device may also include regions for causing transport of charge carriers through the superlattice in a parallel direction relative to the stacked groups of layers. The running carriages may be moved between a front end position and a rear end position in a differential manner.

1459828467-83791f32-15e0-49b7-8f6e-6ea3bcde3048

A plurality of optical members for use in ultraviolet region are mutually stuck. A second deceleration and reduction of the gas phase occurs at the outlet of the second nozzle. The nitride particles are present in a volume fraction in the range of 0. If the calculated WSI is greater than the encoded WSI value, a unit of integrated WSI is accumulated. The length of sample delay buffers within the

equalizer, in combination with the input sample rate, determines the maximum secondary signal delay accommodated by the equalizer.

1459828467-fbe6451f-8f29-4a04-a4cb-09dd2a9c9763

Polynucleotide sequences encoding eukaryotic Rrn3 polypeptides are provided. The capacity of the power gating transistor is determined by first estimating a capacity necessary to meet the demands of all design elements connected to the transistor. The deletion unit determines, from among a plurality of broadcast programs recorded on the storage unit, a broadcast program which becomes a target of deletion, based on an audio signal or a rating of each broadcast program, in cases where a video recording capacity of the storage unit becomes smaller than a predetermined value. The methods and systems can use the time dependent addresses and profiles to distinguish legitimate accesses from unauthorized or malicious ones.

1459828469-321de105-1636-4f1d-9a6e-abfea9f9b275

The present invention is in the field of electrophotographic printers and copiers. Upon receiving a request to access the user account, a determination of whether the user account is in a throttled state may be made. Based on the maximum permitted rates and the burst access thresholds, each source node in the network then controls, at the burst level, the traffic accessing the network and reserves for each admitted burst the burst peak packet rate on a predetermined route, without communicating with other nodes in the network. A final rank corresponding to each of the plurality of digital images is then determined based on the one or more ranks assigned by the one or more crowdworkers to each digital image of the plurality of groups. The control unit 11 also refers to the end pointer for confidential print jobs and moves the confidential print job A to the end of the confidential print jobs.

1459828469-a6170a57-49cc-4ca1-8e73-e0dabf1be7d5

A method and an apparatus for data communication using digital image processing are provided. The at least one fastener includes a bolt extending through the tapered edge and the flared edge, and the bolt is arranged substantially perpendicular to a longitudinal axis of the first and second wall sections. Under the condition of satisfying schedule limitation and power limitation, the method can, by uniting schedule and resource allocation, efficiently optimize system performance with less computing complexity. A cross-correlation module is configured to calculate first and second cross-correlation values of the uplink signal RZ for values of 1 selected such that the sum of the received power from the first UE and the second UE can be accurately estimated.

1459828469-dd3542cd-a9ec-4846-88fa-1833ca273522

A device for warming a shoe is disclosed. The signal terminal duos have two signal terminals. The transformers have secondary windings, each of which is divided at the middle point. The chamber is useful for allowing wet samples including living cells to be viewed under an electron microscope. In particular the present invention relates to the use of a polymer-based hydrogel consisting of at least one water-soluble polymer in a sensor for enriching a dissolved glucose-binding protein, wherein the at least one water-soluble polymer is capable of interacting with the glucose-binding protein and wherein the glucose-binding protein is present in a complex with a ligand.

1459828470-5c7b92c0-159a-4cb2-8f9a-77bd467859d6

A Raman amplifier system is provided for amplifying optical signals that are transmitted via a transmission medium, the series circuit being composed of a standard single-mode fiber arranged on a transmit side, and a second optical fiber arranged on a receive side. Each wheel support structure is mounted to the chassis by a transversely extending support shaft which is slidably mounted within a bearing block. Reverse link multicast long code covers are assigned by a base

station controller and transmitted to the mobile station on a forward channel as derived from the multicast IP address.

1459828470-ef84b864-2474-40b5-b129-e58a4208076e

A variety of structures, methods, systems, and configurations can support plasmons for logic. The compounds are useful for the treatment and/or prophylaxis of diseases that are associated with the activation of the glycogen synthase enzyme, such as diabetes. The user's computer is connected to an advertiser's location in response to extracting a representation of the audio signal including at least the unique coded information. If this limitation is satisfied, both cones can be created with a single machine set up operating from one side of the integrated hub. A first insulating layer made up of an insulated multiple high nitride ceramic layer of low thermal conductivity made of a chemical compound of at least Si, plural transition metals and nitrogen is formed on the heat insulating layer, and a second insulating layer made up of an SiO<sub>2</sub> layer of high insulation characteristics or an Al<sub>2</sub>O<sub>3</sub> layer is formed on the first insulating layer. The lead frame has at least one cooling surface, which is connected in a thermally conductive manner to a thermal contact of the integrated circuit or circuits.

1459828471-4ff70679-a734-43eb-84ec-ec7da99ccf81

A transmission terminal is connected to a management device via a network. The apparatus also includes a mechanism for controlling a flow of inflation fluid through the vent opening. The compacting surface is defined by a series of angularly spaced salient points and a corresponding series of compacting faces. If a liquid leak is not detected for a period of time, the wetness sensor can enter a low power state, extending the life of the device.

1459828471-cdec6b26-14df-4375-a32c-98670aad9a17

A driving circuit includes first and second switches coupled in series, a delay generating circuit and a delay controlling circuit. The opening feature may include an integral flap separable from the remainder of the package to form an access opening to an interior of the package. In some embodiments, the system includes multiple sensors where differences in the capacitive measurements of the sensors can be used to determine information about the radiation such as e. The first members include spaced alignment formations arranged to align the placement of articles on the surface.

1459828472-19f78263-017e-443e-b34e-b85580018b56

A crankshaft, for use with a variable compression ratio engine having a connecting rod and a rod bearing, includes a crankpin adapted to be coupled to the connecting rod with the rod bearing disposed between the crankpin and the connecting rod. In some fiber lasers and amplifiers having large cores problems exist related to energy being generated at multiple-modes, and of mode hopping due to limited control of energy levels and fluctuations. The values thus measured are inspected for conformance to an absolute tolerance range. A display device is capable of receiving a plurality of electrical signals from the thermal scanner generating and displaying a graphical image of the formed mat temperature profile. An ecology valve for use in the fuel system is also described.

1459828472-3372dc54-5818-46e7-be05-e22de9a90aa4

A non-volatile memory and a manufacturing method thereof are provided. One or more rods is disposed below a bottom cap of the reactor pressure tank. The data is organized into groups which represent a collection of information including one or more data fields. The surface energy applicator is operated during each print cycle to alter the surface energy of the blanket for each ink image formed on the blanket.

1459828472-b39cc57e-23fc-441f-91d7-f014e88f5525

A combined battery and wireless-communications apparatus and method. Upon entry of

a request to establish communications between calling and called electronic devices, the system initially looks towards a primary service provider. The speech recognition and synthesis systems and input device are operatively coupled to a processor and storage devices having a plurality of different types of data stored thereon.

1459828473-50c28567-4059-4c1d-b1ec-c7383bc3da79

Provided herein is a method and system for segmenting work implemented in a contact center server. Typically, a densitometer employs a light source that is configured to transmit light across the gap and a detector, opposite the light source, configured to detect light transmitted from the light source, across the gap, for calculating the optical density of the fluid. In particular, therapeutic agents include naked or formulated nucleic acid, polypeptides and chemotherapeutic agents. Specifically, the drain current  $I_d$  of a transistor for supplying a current to the OLED is controlled in a signal line drive circuit thereby keeping constant the drain current  $I_d$  without relying upon the value of a load resistance. A data in/out streaming state machine controls streaming bulk data through the bulk data-in and data-out pipes, while a status streaming state machine controls streaming status packets through the status pipe. When the profile is set as the active profile and an incoming call is received, an automatic response is provided to the incoming call in accordance with the setting.

1459828473-b79eeb32-4828-4c33-bb17-897075a9a092

A method and apparatus for securing, loading and singularly dispensing bags in a bag bundle from a dispensing hook includes a bag bundle formed from a plurality of stacked bags. The multi-speed ram advancement system includes a hydraulic pump connected to the hydraulic conduit system of the frame; and a conduit tube extending into a hydraulic chamber inside the ram and fixedly connected to the frame. The acceptance and dropping is repeated until the attack is defeated. The evaluation unit evaluates whether a converged calculation result is a pattern exhibiting a desired current-voltage characteristic of the cells. PCC value denoting the number of projections on the film per a unit of area along a mean roughness plane and the three-dimensional surface roughness SRA satisfy the following relationship:  $PCC\ value \geq 7000 - 45000 SRA$ .

1459828473-e18262c8-1cc8-49f7-8983-c86c1a7d7b2c

A method for immobilizing biological polymers such as DNA or proteins, on a solid support, by ionocovalent bond, for making biochips, and the resulting chips obtained by the method. In the preferred embodiment, three serial communications ports are interfaced such that any two may be interconnected for communications. In addition, expansion of a target range of the user's interest is quantitatively grasped as distance information, and when the distance information satisfies a predetermined condition, the search condition is updated to reflect the expansion of the target range of the user's interest in the search condition.

1459828473-f8cfbaf8-f6c3-4fcf-b48e-4b100f554e48

A garment includes an outer garment having a skirt portion with an inner side and a pair of elastic tethers having first fastening elements, and an undergarment having a front panel and a pair of second fastening elements. Applications of those processes include the detection of single nucleotide polymorphisms, identification of single base changes, speciation, determination of viral load, genotyping, medical marker diagnostics, and the like. The present invention further provides polymeric materials and optical devices made using these compositions. The weighting coefficients are initially set based on an MMSELS type of signal processing criteria, where the reference signal is the Training Sequence Code.

1459828474-217de84f-c95e-476a-b008-bcfbb098811e

A variety of sugar maple which combines unusually dark green summer foliage and bright red fall color with an upright branch orientation, straight trunk, and

narrowly oval to oval canopy shape. The method provides for constructing N-phase coupled inductors as both single and scalable magnetic structures, where N is an integer greater than 1. Means are provided for preparing an emission surface of the target positioned in the standby position to have a predetermined morphology. The mechanism builds keys to index the data and stores the keys and the data in a Virtual Storage Access Method store having Key Sequenced Data Sets maintained separate from the log record store for the DB2 Log. A suction nozzle is secured to the base portion and in fluid communication with the recovery tank. Furthermore, a process for the production of the cells according to the invention is provided, as well as the novel use of a composition which can be used as active material for the memory cells.

1459828474-e753f5e6-813d-47a6-9caa-4627e80ca9f9

A motor control device according to an embodiment includes a first subtractor, a speed controller, and a phase compensating speed observer. Thus, in the case that the door rotation restricting means is in the operating state, even if the door is pushed by the accommodated baby from the inside of the hood under the state wherein the door is not fixed by the door fixing means in a closing state, the door does not rotate in the opening direction beyond the operating angle and the angle of the door does not exceed the operating angle. The table of nodes includes at least one table entry. The invention can be used to temporarily replace the normal data input and output of an IP core with stimuli and responses used for a variety of purposes. The shaping circuit divides the frequency of the pulsing signal by a second predetermined value and shapes the pulsing signal into a clock signal with a predetermined duty cycle, and outputs the divided and shaped pulsing signal as an output clock signal.

1459828475-12f3225b-da66-47f3-9e42-2f0462cadbf1

A high-altitude aircraft powerplant including an engine, a two-stage turbocharger having an intercooler and an aftercooler, a cryogenic hydrogen fuel source, and a cooling system including a hydrogen heat exchanger. The  $\text{Al}_{203}$  layer has a thickness ranging from about 2-9  $\mu\text{m}$  and is composed of columnar grains having a lengthwidth ratio from about 2-12. Also, the refrigerating apparatus restrains a refrigerant from leaking between an impeller and a diffuser, and increases the efficiency of the turbo compressor. The stability of the physical properties of the produced vinyl polymer hydrogel can be enhanced by controlling the amount of covalent crosslinks. The conditioned clock pulse is resent through a node to the correction block and leak detector where it is reevaluated.

1459828475-462ea478-9c00-49f6-a718-0e193e773a4a

A non-volatile semiconductor device has a memory cell array having electrically erasable programmable non-volatile memory cells, reprogramming and retrieval circuits that temporarily store data to be programmed in the memory cell array and sense data retrieved from the memory cell array. The diameter of all coaxial holes in the housing on the male rotor side, and the diameters of all coaxial holes in the housing on the female rotor side, decrease from the open to the closed end of the housing section. A determination unit receives a result of the detection from the detection unit and determines occurrence of a trouble of the layered composition portion based on the received result of the detection. The jaw with clamping screw locks the micrometer at the proper angle and position with the anvil over the well center.

1459828475-7727a040-46d3-4197-84c6-b321596e40c9

A femoral implant for fitting to a resected femur comprises a section having a frustoconical external form, a stem part extending away from the section to a distal end of the implant, and a femoral head extending directly away from the section to the proximal end of the implant. That is, at least a portion of the band is bendable by a user such that the band returns to its original form when released by the user. The method also includes applying a solution to the conductive

surface, the solution comprising at least one charged particle. The one or two symbols that include the control information are monitored. A compound represented by the formula I: wherein each symbol is as defined in the specification, a pharmacologically acceptable salt thereof, and a medicament containing the compound as an active ingredient. The dressing tool is an essentially cylindrical gear wheel, having an abrasive coating on the surface that effects the dressing, which is brought into engagement with the grinding worm to move relative to the grinding worm in axial direction of the same to profile the flanks of the grinding worm.

1459828476-3dcf2d8d-039b-4ccc-aa6d-e9f121ad39f9

Methods and associated hub arrangements are described for use in diagnosis and recovery in high performance digital loops such as, for example, those seen in Fibre Channel systems. This process essentially eliminates exploding vias due to vias extending beyond the edge of metal lines. The modular tower is constructed from sections.

1459828476-5d3497a7-31c5-47d7-8945-32547d777781

Embodiments disclosed herein provide systems and methods for an in-ground sprinkler to controller a liquid flow rate through a chamber, while reducing or eliminating leakage. RFID transaction device includes a transactions counter for tallying the number of transactions attempted or completed with the RFID transactions device. The pocket is made by forming mirror image indentions in the land portions of the two sides of a sheet metal workpiece such that, when the two sides are folded together, the indentions cooperate to form the pocket. the reliability of submember is enhanced;.

1459828476-d98fed1e-9c10-4794-a587-9c56c7b6aa7e

A device configured for capture of activity data for a user includes a housing, a sensor, a motor, a memory, and a processor. Accordingly, the control unit can be shared among a plurality of types of uninterruptible power supply devices. A drain region of the drive transistor and a source region of the select transistor are asymmetrically arranged. A fuel accumulation bore is provided between inner circumference of the cylindrical valve body and outer circumference of the nozzle needle. Also disclosed is a polarization-maintaining double-clad fiber comprising one or both of at least one circular axially extending stress inducing region and an inner cladding comprising a circular outer perimeter. The plurality of DSL systems are ranked based on a ranking characteristic different than the common static characteristic.

1459828477-61c67361-3566-4ee1-846f-8ecd08a6cd07

Improved vocal signals are obtained in headsets and similar devices by including a microphone inside a chamber formed at least in part by the wearer's ear. The system comprises a computer system including a processor, a memory coupled with the processor, an input coupled with the processor for receiving a series of image frames from a camera, and an output coupled with the processor for outputting a path of a pointer. The node names are represented as node patterns and grouped into node pattern sets. The set of extension cables may provide electrical connection between the terminal block and one or more terminals disposed on a back plane associated with the shelf unit. The method includes transmitting a sample of the multi-dimensional symbol using K transmit antennas. The particulates formed by milling are shot off from the outlet on the sidewall of the outer disk.

1459828477-7e1cf9c4-1ef9-4197-862e-a52a3d0d291c

A position sensitive radiation spectrometer for identifying, quantifying, and locating a radioactive source in a target. One of the two power supply lines is connected with an externally located main power source, and the other power supply line is connected with an externally located backup power source. The data streams are synchronized using a navigation file, which comprises descriptors pointing to parts of said data streams, wherein said descriptors define the arrangement in time

for said data streams by means of data sub stream paths.

1459828477-e3d9ddcc-34ae-4348-a33a-c08a556f64b8

A shrink film includes an internal layer including a styrenebutadienestyrene block copolymer; and first and second outer layers including an olefinic polymer. The photo mask blank permits the production of a phase-shift photo mask having a high transmittance at an exposure wavelength and a low reflectance as well as a low transmittance at a defect-inspection wavelength. According to a second operation, a process to add video material or delete video material specified from the video materials belonging to the group is performed. It is possible after detection of the strength of each beam to introduce a correction, reflecting the signal-to-noise ratio. The light emitting device package includes a package body, an electrode formed on at least one surface of the package body, a light emitting device mounted on the package body, and a phosphor layer enclosing the light emitting device while having a uniform thickness around the light emitting device.

1459828478-4f6fac3c-56c7-4ff5-a34e-25f0e0a41e60

A semiconductor device includes a trench isolating elements, a memory cell transistor and a peripheral circuit Vcc transistor having a thermal oxide film of a first thickness, and a peripheral circuit Vpp transistor including a thermal oxide film and a thermal oxide film formed before trench formation, having a second thickness greater than the first thickness. The body is of material varying in length through application of electric and/or magnetic fields. Comparison of the user's preferences with the various profiles allows the user only to be informed of those persons that it is likely to be interested in. A cable-receiving passageway extends through the bushing to permit one or more cables to be passed therethrough. The difference between a current elevation and the reference elevation is determined and this difference is divided by a floor height to obtain a floor number. Then, the job created in this manner is activated.

1459828478-bf247853-69d9-48ce-aa66-9baf271a2e21

A method of providing caller information can include receiving a voice signal, detecting portions of the voice signal that are inaudible using a perceptual audio processor, replacing the inaudible portions of the voice signal with digital caller information, and transmitting the resulting voice signal specifying the digital caller information. In a preferred embodiment a plurality of users interact in the three-dimensional, computer-generated graphical space where each user executes a client process to view a virtual world from the perspective of that user. The display track may be lowered or pivoted to properly display the item, motion of the display frame and track may be controlled by computer. This drive signal is applied to a fluid dispenser to cause fluid ejection. The femoral hip prosthesis elastically deforms when loaded during use to apply dynamic compressive loads and displacement to the calcar region of the resected proximal femur.

1459828478-f5b59b21-ac94-4371-87e7-650c6217e297

A liquid crystal panel includes a signal transmission section and a flexible printed circuit. When the terminal is a PC, moving image data is sent directly from a moving image buffer memory to a transmission image memory. A plurality of lips integral with the plurality of prongs and extending upwardly from the lower end portions thereof, respectively, receive bacon strips therealong. The open reservoir and reaction chamber are each connected to the pump chamber through the channels. The second fin structure is formed by the first semiconductor material layer as a lower portion and the semiconductor oxide layer as a first middle portion, the first semiconductor material layer as a second middle portion beside the first middle and the second semiconductor material layer as an upper portion. The at least one controller may, for each of the cells, determine a capacity of the cell, determine a duration of time to supply cell load current to reduce the determined capacity of the cell to a value approximately equal to a minimum of the determined capacities, and cause the cell to supply cell load current for the determined

duration of time to balance the battery.

1459828479-154e5cbc-a1d1-473d-a54b-5b35d0fe90cb

Method and system for implementing a backup in a cluster comprising a plurality of interconnected nodes, at least one of the nodes comprising a cluster resource manager, and at least one of the nodes comprising a policy engine, the PE maintaining at least one dependency associated with at least a first resource executing on at least one of the nodes. A cylindrical part without threads formed thereon is provided on the leading end side of a metal housing of a spark plug and the thermal stress applied to a mounting hole is mitigated by avoiding close contact with the mounting hole of an engine head. Power consumption is reduced from approximately 35 watts to 10 watts. Means are also provided for determining from the retinal wavefront data aberrations in the optical system.

1459828479-ad9808b9-21df-4cef-8ace-80f0cb65f4ae

Protecting elements are respectively connected between a control terminal Ctl and a ground terminal GND of a logic circuit L, between a point Cp and a ground terminal GND, and between a power supply terminal VDD and a ground terminal GND thereof. The system further includes a process air line branching off from the engine bleed air line such that the engine bleed air is supplied to the process air line and connecting to an input side of a turbine. Knowing the compressibility factor of the gas, the temperature, and the diameter of the pipe, the wall thickness of the pipe may be calculated for the pressure range of the gas at the selected temperature. The wire unit includes a pair of second pivot parts pivotally retained at aligned pairs of the second and third pivot holes to permit relative rotation between the wireless transceiver module and the coupling base about the second pivot axis. The methods semi-automatically or automatically delineate an item in an image, receive a 3D model of the item, matches said item to said 3D model, and send the matched 3D model to a 3D printer.

1459828480-24d744fd-3e64-4ed5-a8f5-5fb873c274b7

A light emitting device having excellent characteristics such as light emitting efficiency and the like and electrical equipment provided with such a light emitting device and having high reliability are provided. A number of electrical contact points with which contact may be created via electrical contact elements are provided on one side of the sensor element. The pendulum movement of the pipe cathode is preferably such that the pipe cathode is rotated by a certain first angle in a first direction and subsequently by a certain second angle in a second direction, the second angle differing from the first angle. The processing unit produces a second image data according to the first image data and produces an image parameter according to the second image data.

1459828480-88cc912d-357a-4c9a-803d-2ba6901fa94d

The invention is directed to neurological lead extensions without set screws, set screw blocks, or set screw inserts. A movable contact section includes a plurality of movable contacts and has elasticity. A thermal barrier is disposed between the one or more photovoltaic cells and the building, isolating the two from one another. 1 \u03bcm, and which is ejected at an incident angle of equal to or less than 80 degrees with respect to the other surface of the metal plate, and at an ejection pressure of 0.

1459828480-9c458dcf-9182-408f-be08-20d67efa7648

Consistent with one example embodiment, communications systems, using a serial data transfer bus having a serial data line and a clock line used to implement a communications protocol, incorporate programmable loading of a logic value into parallel slave device registers. A portion of the wastewater is diverted from a sewer main. An integrating analog to digital converter circuit receives the generated current flow voltages from the I-V controller and performs measurement cycles thereon. When the connecting element is in the rotating portion, the cover

is rotatable with respect to the base. The server then requests a storage system for each file having an elapsed time less than or equal to a pre-determined time limit using an internal-retry request and requests from the storage system each file having an elapsed time greater than a pre-determined time limit using a fail-fast request.

1459828480-feb7ab38-431e-4039-adb4-aa52cc49ee03

A dual electrode arrangement, is provided, wherein two, preferably unidirectional, electrode configurations flank a nerve junction from which a preselected nerve branch issues, proximally and distally to the junction, with respect to the brain. The sensor chip is inserted into a chip housing, the bumps making contact with corresponding connecting leads belonging to the chip housing. Different numbers of the delay elements are configured to produce different asynchronous delays and to strobe sequential pipeline elements of the memory device. The cages accept large, flat objects such as drywall panels or plywood supporting them for safe transportation. A centroid calculation can be included to bias the voltage-controlled oscillator to push the equalizer coefficients back to the ideal position.

1459828481-03b53640-2499-4872-9811-8180fad5828f

A semiconductor device includes a first insulating film formed above a semiconductor substrate, a fuse formed above the first insulating film, a second insulating film formed above the first insulating film and the fuse and including an opening reaching the fuse, and a third insulating film formed above the second insulating film and in the opening. The search index can be divided into partitions with a partition assigned a first capacity utilization threshold and a second capacity utilization threshold. Consequently, a system developer or integration programmer can focus on functions of the interfaces required for the integration and no longer have to deal with the construction and processing of messages of the interfaces.

1459828481-29167607-b13e-4cfd-8ccc-a46f0215120b

A micropower apparatus and method for milliohm resistance detection includes a drive circuit and a monitoring circuit. The method includes combining in a solution a DNA-containing biological sample, a salt, a cationic surfactant, and a DNA-binding carrier, the solution having a salt concentration higher than the DNA precipitation inhibition-initiating concentration, to lyse the DNA-containing biological sample and to bind DNA to the DNA-binding carrier while in the solution to form a bound DNA-carrier. The positioning device is disposed on an interior face of the sidewall for removably securing a combination amplifier. Customers search the database, and if previously registered and accepted by the vendor, the customer can reserve a defined quantity of G-S in accordance with set-aside parameters, request a quote, and/or purchase G-S from the vendor. This event is detected as a transient current by a voltage clamp amplifier. The sheet material may also be provided with a self-latching structure.

1459828481-ea4def94-b45b-4e45-9767-7755ddfb7595

A system and method for coordinated manipulation of multiple displayed maps, even when the maps use different internal coordinate systems. Guide information for time periods in the near future is transmitted more frequently than guide information for later time periods. These systems and methods may, in another embodiment, provide data in response to a query made by a user to an electronic form that was previously associated with the electronic form, the user, and the query. A sensor receives the secondary beam and provides analog signals having properties that are characteristic of the secondary beam. The first transceiver is able to receive, over at least a subset of the set of wires utilized for the downstream multiplexed transmission, an upstream transmission comprising a second direction of the bidirectional data channel. The mounting portions are fixed to the side plate.

1459828482-97d18855-60e3-4f9d-9c19-fff9cd384aef

A method for displaying a plurality of windows on a display screen is described. Embodiments of the invention provide fully programmable hardware in which all of the states of an RE are instantiated and all of the states are fully connected. The subsequently falling coins form additional rows vertically above the previous rows in a well-ordered manner by gravity assist and judiciously spaced guides on the sides. A mechanism is provided within the passageway for exerting a bias force against the pressure responsive element which is sufficient to close the inlet opening to fluid flow absent a pre-established level of fluid pressure exerted on the pressure responsive element.

1459828482-b954fc72-6be6-4061-9c04-610ab3722295

Method for redirecting outbound VLAN traffic away from an inactive external port of a switch. The method includes the following steps: formation or application of a function layer onto the substrate, removing the function layer from the substrate at the chip positions at least in the region of contacts to uncover the contacts, tacking chips onto one chip contact side of the function layer at the chip positions and contacting the chips with the contacts via contact elements. The forceps are fabricated of a non-heat treatable metal and the gripping platforms are manually adjustable. This apparatus includes a video input port, for receiving video data for a current video frame, and a video input buffer, for storing video data from the video input port.

1459828482-bf65aff1-5b60-4178-8fd6-143383612940

According to one aspect of the invention, a method is provided in which one or more write commands and their corresponding write data are received from a first device. The solution contains varied amounts of glucose, pyruvates, amino acids, vitamins K5 and C, antioxidants, fatty acids to supply the specimens with the chemical ingredients and uptake requirements required to recover and prosper during and after the cryopreservation process. A high priority task scrubs a deduplicated data object when a priority attribute indicates that the deduplicated data object is used by a critical source data object. A cap layer may be positioned over and in contact relationship with the support member. The transmission has a device that detects the clutch torque transmitted by the friction clutch of the active transmission path, which is coupled to the output shaft, and, when the clutch torque falls below threshold value, initiates a disengagement of the active gear ratio.

1459828483-22d25897-3141-4dc1-981e-84eeab6909c8

An apparatus comprising a first quantizer circuit, a memory and a second quantizer circuit. Electronic appliances such as computers equipped in accordance with the present invention help to ensure that information is accessed and used only in authorized ways, and maintain the integrity, availability, and/or confidentiality of the information. An adhesive is applied to an outer periphery of the upper member and to an upper periphery of the lower member, and a protective ring is positioned around the outer periphery of the upper member and the upper periphery of the lower member. , DPMFDPMS signals, output from Micom, the controller, are all \u201cLow\u201d and \u201cLow\u201d, a main power switch is turned off. Then a first reliable region that comprises at least one intra-coded coding block is determined, and the first reliable region in the video sequence is encoded such that creation of an information dependency between the first reliable region and coding blocks outside the first reliable region is prevented.

1459828483-382e9bdb-125f-4606-bed0-5b411c6c9fba

An induction furnace includes an induction coil, an electrically non-conductive crucible having an inner diameter disposed within the induction coil, and an electrically conductive member disposed below the crucible and having an outer diameter which is further from the induction coil than is the inner diameter of the crucible. A diffraction optical element is disposed in a light path of a first

light beam of a first wavelength  $\lambda_1$  and a second light beam of a second wavelength  $\lambda_2$ . Either the cathode or the anode or both include metal oxide coating layers on electrode active material particles forming the electrode or a metal oxide coating layer on the surface of an electrode layer formed on a current collector. The electron emission unit includes a first electrode, a second electrode, and a plurality of electron emitters. Alternatively, the storage system can also generate a first set of metadata associated with a first set of stored data, generate a second set of stored data which is a copy of the first set of stored data, generate a second set of metadata associated with the second set of stored data, and compare the first set of metadata and the second set of metadata.

1459828483-548daaae-564d-4a02-b346-280dafa57fc4

A thin layer substrate has a plurality of micron sized electrically conductive whisker components which are arranged in parallel and extending from one surface of the substrate to another surface to provide electrically conductive paths through the substrate. In a preferred embodiment, the invention is a static frequency divider with a divider ratio which can be switched over, which includes first and second divider D-type flip-flops which each have two inputs which can be alternately activated by way of control inputs, in order to prevent the occurrence of metastable conditions. The measuring device further comprises an adapter enclosing the beam path for coupling the measuring device to a laser system which provides the laser beam. The device distributes a second group of the audio streams in the video communication session, while muting the first group of audio streams in the video communication session.

1459828483-f76abafe-b333-4201-8d7f-fa9a128aaaa6

A wick trimmer apparatus is herein provided and more particularly, a wick trimmer with a measuring foot that facilitates the effective cutting of a wick to an appropriate length. The wild indicator symbols may also be associated with a card or plurality of cards within a display device. A spectrum tailoring module is then used to tailor the spectral profile of the optical pulses. The tape and mandrels operate together to minimize cracks and pores in the toroids and provide an added advantage of maintaining high tolerances in the internal cavity dimensions as well as the cavity-to-cavity alignment.

1459828484-4917d267-310b-487f-9856-0a293c93a154

A system includes a server and a controller embedded in a device. In this way, redundant word lines may be selected without repetition until all of the redundant word lines have been selected. The balloon pump can include tapered longitudinal ends and/or be segmented into a plurality of pumping chamber subsegments, each pumping chamber subsegment separated by a flexible power conduit link, where the diameter of the pumping chamber subsegments are independent of one another.

1459828484-c2b0a177-a2bc-465f-b43c-3e736d894c07

A method for treating progression of a refractive disorder in a human eye. The nonwoven web can be a three-dimensional, fluid pervious, polymeric web. The wire maintains the strap in a desired geometry that is different from a previous geometry of the strap.

1459828484-e4692ad3-ad38-4600-afa0-2decc3290e8e

There is provided a pest control agent comprising a compound represented by formula as active ingredient. Furthermore, the control unit is operatively connected to the temperature adjustment unit. For example, the magnetic recording tape may have a coercivity of greater than or equal to 2000 Oe with a magnetic flux modulation characteristic having a one sigma standard deviation of less than 0. Therefore, in the dynamic LED display screen, the refresh frequency can be increased to N times of the original refresh frequency while the original resolution is maintained. Glue is filled in the inner gap and the outer gap.

1459828485-648124b1-7315-4327-91ee-b0249b988e5d

A relay is described to facilitate communication through the telephone system between hearing users and users who need or desire assistance in understanding voice communications. The diagnostic information includes location-specific event records, counters and IEGM signals. A related method for preparing such a composition is also described, as well as a system for use in performing such a method, and articles incorporating such a composition.

1459828485-82848560-a145-44e2-8ad0-c630c1343647

Methods and systems are provided for remotely securing data in a wireless device. The user terminal receives the same content distributed from a broadcast content server by the PtP channel. The request manager retrieves a management definition object and a perspective that corresponds to the view request, which the request manager uses to generate a view that includes nodes corresponding to an enterprise's objects.

1459828485-9e580345-6271-45dc-89a6-9f876118c7da

A bypass valve for directing fluid flow, where the bypass valve includes a valve body with a notch in at least one end thereof and a spool seated within the valve body. Systems and methods of symbol correction in prediction decision feedback equalization architectures are described including systems and methods that include an enhanced Viterbi decoder and novel methods of symbol correction to obtain better system performance. A transfer chamber transfers the semiconductor wafers. Preferably two air outlets are located proximate to an upper end of the vertical housing section.

1459828485-a96eb412-6a20-4a44-9814-722847f78875

CD playback apparatus for reproducing information from unfinalized CD-R disks which have no index information stored in a table of contents area which scans a disk coarsely to detect the end of the recorded area approximately and scans the disk finely in the area of the detected approximate end, to detect the end of the recorded area with greater accuracy. The communication returns to normal mode when the network detects that the link quality has improved. The optical imaging system is particularly advantageous when embodied as a microlithographic projection exposure system.

1459828485-cc61e63b-2b83-4e97-83c5-d861211d5a49

Power consumption may be reduced in a media device including a first processor coupled to the non-volatile memory, either directly or indirectly, allowing the first processor to generate a pointer structure. According to the invention, the activity of the solid biocide can be maintained by additionally treating the liquid with the composite material, which absorbs from which the liquid and/or contaminants simultaneously releases active ingredients for sterilizing and/or reducing the contaminants in the liquid. Customer data encrypted with the at least one encryption key can be received such that the customer data is uniquely associated with both the client system and with the customer. A method of adjusting a pedestal includes leveling the pedestal, translating the pedestal, calibrating the pedestal height to a preheat ring level, and checking the level and location of the pedestal while rotating the pedestal. The metallic material gas is not in contact with the catalytic material, and the catalytic material is not degraded.

1459828486-76879789-e2e1-4666-b5a9-5af60a23f5bc

A gas seal assembly includes a pair of mutually rotatable sealing members, each of which has a front face adjacent a gap between the two members which constitutes a leakage path through the seal assembly. The circuit configuration utilizes a voltage drop across a connecting line, in particular a bonding wire, which is connected in series with the power switch for the purpose of determining the load current. As provided herein, at least one of the actuator arms is a depopulated actuator arm which retains less than two transducer assemblies. The closing of the

casing covers will safely engage an interconnection with the lamp's electrodes through the electrode cover assembly. Preferably, an RF subsystem conducts multiple reads of a transponder on a passing vehicle and forwards the read information to the MVIC unit. The system may include a first client network device having a first client module and a second client network device of the plurality of client network devices.

1459828486-a4701249-b18e-4a9e-945a-121944b96321

An alternating current power generation system including an alternating current generator comprising an exciter, a brushless permanent magnet generator voltage source configured to generate a first voltage at a first frequency, a second voltage source configured to generate a second voltage at a second frequency, and a coil. The stroker tool has a pump, a driving unit for driving the pump, and an axial force generator. The method includes scanning the pixels associated with the graphic primitive in one of the plurality of blocks into which the graphic primitive extends, repeating the preceding steps until all of the pixels associated with the graphic primitive have been scanned in each of the plurality of blocks into which the graphic primitive extends, and outputting the pixel data. The positioning of the biological element is determined by comparing the intensity thus measured with at least one reference value. The heat-dissipating member provides a first heat-dissipating path for the first electronic component. Furthermore, triple junctions, at which the conductive stem pins, the insulating base member to which the stem pins are joined, and vacuum intersect, are positioned inside the recesses and put in concealed-like states.

1459828486-ca387cb9-7e57-4367-8ffd-fd21a37ce4f5

The invention relates to a glove, especially a disposable glove. The microfiber cloths each have an opening through a center portion thereof, and a shaft of the rotor assembly extends through the opening. A vision system may also be provided and associated with the machine vision system such that the vision system views and captures an image of the object when lit by the lighting system. The present invention is further directed to a method for treating fibrosis in a subject in need of treatment, comprising administering to the subject an amount of eba<sup>1</sup> or an eba<sup>1</sup> analogue effective to treat the fibrosis. 1 mole %, based on the amount of monomer units in the polymer, contains monomeric units each covalently bonded to a pendant, optionally alkoxyated, hydrocarbyl group having from 6 to 40 carbon atoms, said pendant, optionally alkoxyated, hydrocarbyl group being connected to the backbone of said hydrophobically modified polymer via a non-ester containing linking group.

1459828487-03f3a83e-e8a5-4664-b88b-114276cf75ec

A laser cooling system includes a substrate, an REO layer of single crystal rare earth oxide including at least one rare earth element positioned on the surface of the substrate, and an active layer of single crystal semiconductor material positioned on the REO layer to form a semiconductor-on-insulator device. A supporting section is located above the recessed portion such that a hollow space stands between the supporting section and the recessed portion. The method and apparatus deploys a plurality of proxy servers within the network. For example, one system includes a controller operatively coupleable amongst a leftmost landing gear, a rightmost landing gear, and an intermediate landing gear of an aircraft.

1459828487-2b4624bb-7cb1-47e6-ac7a-8675012d0f87

The invention provides tools and techniques for clone brushing pixels in an image while accounting for inconsistencies in apparent depth and orientation within the image. The closure has a base, which includes the additive reservoir; a spout mounted on the base; a plunger positioned in the additive reservoir, and an outer cap. And an annular seal is disposed within the aperture for radially sealing between the first structure and the second structure. Some of these pre-packaged programs are locked-out to the patient, and can be activated remotely via a server

by the physician. The error detection circuits generally function as active low pass filters and generate error signals for the feedback circuits. possible that a user who is accessing a node within a peer group has also access to any other node of the peer group, without being requested for authentication.

1459828487-6538a63e-6bee-4734-b641-693b3896da31

There are provided a plasma display device in which dark contrast can be enhanced without deteriorating an image quality and a method of driving a plasma display panel. A locking spindle is disposed in the latch operating tube and has a locking tongue extending radially and outwardly through the outer drive tube to interlock with an outer rose when the locking spindle is pressed by a push button to move to a locked state. The tip guard has a cavity contoured to an exterior surface of the oscillating spray tip with an opening at a front end of the tip guard thereby enabling pressurized water to exit from both the oscillating spray tip as well as the tip guard. The filter is mounted at the end of the passage to close the passage. To promote adhesion of the ceramic coating, the component surface or the intermediate layer surface may be subjected to a surface roughening treatment prior to depositing the ceramic coating.

1459828487-ebb05053-fee1-4a5f-ac8a-2aa91dc6c1ea

A staircase combination of the gang socket includes a plurality of integrally formed tubular sockets each having a bottom partially connected to the upper rim of the next socket and so on until a last socket partially connected its upper rim to the bottom of the socket positioned at above. The apparatus includes a generator to generate an event information table and an extended text table. An electrical device can be formed to overlie the body contact. Beehive weight data can be obtained in a continuous fashion, without requiring any moving of the beehive or of the apparatus, and without any other type of disruption.

1459828487-f71989b4-6cab-4482-9656-b295a0b42177

A loader conveyor adapted so as to receive a wafer carrier from a transfer conveyor and adapted to terminate at an intersection with a processing system, is provided. The circuit layer includes at least one mounting area having a first electrode, a second electrode and a heat conductive section spaced from each other. A multiplier  $w$  and adder+correct the generated syndrome using data based on a coded word which is stored in an  $n$ -bit buffer and starts from the second start position  $ci+n$ , and a NOR detects the start position of the cyclic code sequence with the code length  $n$  on the basis of the modified syndrome. Toner scattered from the developing device side and headed to the density detecting member can be reduced, and ozone near a post charging device can be removed. In one embodiment of the present invention, the first sensor is designed to detect surface movement of the water in the pool caused by an object entering and disturbing the surface of the water. The flywheel rim liner has a modulus of elasticity  $el$ , and a density  $\rho$ , and a liner ratio  $Rl$  equal to  $El/\rho$ .

1459828488-02ef39e4-ce54-4859-869c-e629ff7dae9a

When the condition for starting an engine is satisfied, the controller executes the lock switching control in which the wheels are forcibly locked by the brake device and the parking lock mechanism is released to unlock the driveshaft, and then the controller executes the cranking control in which the engine is started by the motor-generator. After dispensing, the plunger may clockwise rotate about the syringe barrel until the mating members and the corresponding mating members are unlocked lengthwise each other. The collar presses down on the circuit and the punch presses down on the bridge with enough force to form the bridge break.

1459828488-049b186f-260d-45cd-a58a-714b439c9604

A two-phase switched reluctance motor in an embodiment includes a plurality of salient rotor poles that each have asymmetric reluctances about a central radial axis of the respective rotor pole. The front glass member has light transmission

properties at least partly, and the substrate opposes the front glass member through a vacuum space. The conductive pattern is disposed within the trench of the substrate. In response to information received from the target storage system indicating one or more data chunks that are missing at the target storage system, the missing data chunks are then transmitted to the target storage system.

1459828488-5b1fc5c0-5848-42b7-a048-ba500fb00705

A system for steering a beam includes a main reflector that receives a signal from a subreflector and reflects the signal in a reflection direction. Under neutral or mildly acidic conditions, including those found in vivo, the free amino group-containing biologically active substance is released from the conjugate by hydrolysis of an amide bond. When the difference exceeds a threshold value, the operations of the left and right actuators are stopped, whereby an excessive load is previously prevented from being applied to a main wing structure or the flap operating system. A block load module is configured to load data of at least the block size of the non-volatile memory device. The console includes signal analysis circuitry, which analyzes the processed signal using the combined calibration data provided by the probe adapter.

1459828488-6a7d2210-a41b-44e4-b507-01ef5ef891c6

A frame member has two spaced apart parallel rings that are fixed to one another at a first location. The mask assembly is intended for use with a cathode ray tube. The content may be generated by an OLAP based channel database system, and the output may also be communicated to individuals via spreadsheet programs data, pager, telephone, mobile phone, fax, personal digital assistants, HTML e-mail, WAP and other formats. With the aid of the working laser beam, a second optical projection is projected onto a second projection surface that is located outside of the monitoring zone. Each of the output shafts is locked to a servo motor and are free to rotate with respect to one another.

1459828488-8b87e2cc-7e46-4581-be9c-f44d9fafff9e

An earthmoving scraping device has a bowl-shaped frame with walls and a frame floor that define an interior for transporting material and a walking beam system for the rear wheels thereof that includes a suspension arm pivotally connected between the back end of the frame and a beam, the beam having first and second axles on separate sides of the beam. The passageway includes an inlet and an outlet spaced apart along the longitudinal axis and defines a K-factor of about 5. Each codeword in the superblock is projected onto an orthogonal complement of a correspond transmitted codeword using the projector matrix to obtain a corresponding distance metric of a generalized likelihood ratio test codeword. The sleeve extends past said end portion with a clearance therebetween and extends beyond said end surface. Through this procedure, it is possible to reduce the terminal handover signal load generated by the base station. A diffractive optical element is positioned to intercept the beam of scattered radiation and is adapted to deflect a first portion of the beam by a predetermined offset relative to a second portion of the beam, and then to optically combine the first portion with the second portion to generate a product beam.

1459828489-1f03c3b3-74ce-4633-b5fa-c580c6d09d09

There is described a method of controlling a basestation in a cellular wireless communications network, the method comprising, within the basestation, autonomously and dynamically adapting a maximum value for a total transmit power of the basestation, such that interference between the basestation and other access points in the vicinity is minimized. The methods and systems provided can effectively monitor and manage the resources and events of each of a plurality of computers within a fluidly changing network environment. The spring is arranged between the side walls. The control unit has two main types of recordable data contained within: structure data for identifying one or more elements upon the overlay, and audio data that corresponds to the elements of the overlay.

1459828489-50748c06-28ed-4e41-a175-c62964f75643

Methods, systems, and apparatus, including computer program products, for organizing music tracks based on shared metadata. This composition may be used as a care product and/or a make-up product for the skin and/or for keratinous materials. The root turn may have a generally rectangular shape and may account for reduced pressure losses relative to conventional curved root turns. Various fittings can be used to engage at least one of the cylinders of the channel to fix the channel in position relative to a second, third and/or fourth channel to form the column, beam or rail. Then, the reinforcing fiber substrates are received together with the metal bushing in the molding die and then the thermosetting resin is poured into the molding die.

1459828489-75c789f8-5a03-43a3-a5c5-381f071b12fc

A swinging seat includes suspension members having coil springs of nonlinear response so that the seat has a desirable bouncy feel for a wide range of weights supported on the seat. Two new parameters are defined for inclusion in the service logic of application servers and serving Call Session Control Function servers. The receiver then chooses a first set of indices corresponding to combined channel model parameters from among the first plurality of combined channel model parameters having magnitudes passing a combined channel model parameter threshold. These main language and sub-language are previously stored in the memory. The vehicle speed sensor is disposed higher than the center of the axle and near to the outside of the vehicle with respect to the center of the axle.

1459828489-ada4247a-8145-4634-9c0c-21f9301a569f

The invention relates to a catalyzer for burning at least part of a fuel/oxidant mixture flowing through the catalyzer, in particular for a burner of a power plant installation. The memory array is arranged in rows and columns, and can be further arranged in addressable blocks. The pressure sensor is configured to sense the pressure of the fluid within the inflatable portion of the gastric band.

1459828490-12fd5782-0234-481b-9f63-2de9567c9a1a

A method and apparatus is provided for compensating for variable overlap between segments of a page width print head system to reduce visually perceptible artifacts due to misalignment of adjacent overlapped segments. The smart chip, or electronic circuit, includes at least a unique identification number or data specific to the particular temperature measuring device stored thereon. The publishing leads to dissemination of the asynchronous content from the result server to the subscribed clients, and removal of the asynchronous content from the result server. The decision unit serves to decide whether the temperature increase corresponding to the current density and the data rate acquired by the acquisition unit is within a permissible range.

1459828490-9cf4ac6f-9f88-4320-808c-9fb9bd4d6fd7

A method of operating the torque converter lock-up clutch in a power transmission of a working machine comprising at least one hydraulically actuated lifting device. The at least one vasoconstrictive agent is added in amounts sufficient to reduce or prevent vasodilation. The head has a thickness defined between two lateral sides thereof and is substantially larger than a longitudinal length of the holding space, i. When load voltage is changed, the detected current phase value is adjusted with the result that the drive frequency  $f_0$  is adjusted.

1459828490-c84c80ac-5316-4cdb-a420-bf6991568888

The invention provides an arbitration method and an arbiter circuit by which equal arbitration of output cells can be achieved with a comparatively simple configuration even where a very great number of queues are involved. A high density optical recording medium according to the present invention adopts a combination of two different super-resolution layers of mutually complementary optical

characteristics with increasing light power. Each threat while interacting with its surrounding generates a unique threat signature. Displacement of the latest partial image with respect to the already acquired partial image is caused in the retrieval range and a difference between the already acquired partial image and the latest partial image concerning the inspection region is found every displacement. Each of the individual cells has conductive appendages for conducting information to and from the individual cells. The retaining element is adapted to retrieve nuts from the ground and includes a plurality of resilient pieces arranged in rows on a sleeve.

1459828491-a4dc973f-e923-48dc-82bf-8651aa68ba2d

An electrochromic device, such as a window or mirror, is disclosed that includes first and second substrates each having an inner surface spaced apart from one another to define a chamber, first and second electrodes carried on the inner surface of the second substrate and disposed thereon to be electrically isolated from one another, and an electrochromic medium disposed in the chamber. A power supply control means controls the gate and drain power supplies at the rise time so that an output voltage of the gate power supply rises earlier than that of the drain power supply. A reversible peristaltic pump pumps the infusion fluid forwardly into the patient blood vessel and reverses its direction to pump blood into the testing chamber to perform a glucose level test. When the user's face is directed rightward or leftward, while the user's line of sight is directed in a direction laterally opposite to the face direction, a head shake recognizing section 22 recognizes that the user has shaken his or her head.

1459828491-d8443dd1-7b51-4253-b78b-827c693498a8

A security device for monitoring personal property using a wireless interface to a communication network is presented. The mobile terminal estimates signal quality of a forward link during a first power control group period and determines a power control bit based on the estimated signal quality. A pressure medium applied through passageways in the substrate flexes the dome in an elastic manner so that the dome does not contact the contact pad. The specific set of object classes includes a \u201cFunctional Router\u201d class, representing an abstract model of a dummy router, which describes a set of interconnections between at least two modelled functional components, each instance of the \u201cFunctional Router\u201d class being called a modelled functional router. A cooperating tool assembly is provided to operate the bicycle storage assembly and to pivot the upper track with respect to the lower track to load and unload bikes. , a bolus port, as well as provide a versatile suture structure to enable the pump to be properly secured within an implantation site.

1459828491-e3c6218f-842e-4dd6-8091-0e7ffac4cf3a

A computer system for easily fixing a generated conflict, and a method thereof are provided. For instance, a macro base station may instruct a mobile station to engage in a synchronization operation that synchronizes one or more timings of a femto base station with one or more corresponding timings of the macro base station. Each of the pixels has a PD and a microlens. The insertion of the logic element is performed such that the arrival time of a signal to the input of the inserted logic element occurs before half of a clock cycle and the propagation time of the input signal from the inserted logic element to the destination element is less than half the clock cycle.

1459828491-e51342ce-9e6e-4550-aada-4fcff3b5e6f4

A method and system for delivering data over a network to a large number of clients, which may be suitable for building large-scale Video-on-Demand systems. The access device is actuated to a second configuration having an enlarged cross-sectional area at the distal portion thereof such that the distal portion extends across at least a portion of each of two adjacent vertebrae. The prank call server assigns a unique global identifier to each 911 call detected on the 911 emergency

call system. The jetspray nozzle is capable of cleaning photo masks or wafers without the use of chemicals.

1459828492-2058fc49-43ba-44ce-85a0-5620315d55ff

Operations of a relay are disclosed. Other embodiments may be described and claimed. Some methods use NMR in conjunction with another experimental method, such as, capillary electrophoretic techniques for the analysis.

1459828492-476b5d48-3d7d-47c2-b26d-7f1bc1db7ac6

A process cartridge configured to be detachably mounted in an image forming apparatus. In the subject methods, a heart valve is first in structurally modified. The readout apparatus set to a second mode reads a sensing current of a current type touch panel through a current to voltage converting unit and an inverting amplifier, so as to save a chip area.

1459828492-5ad0f813-ea34-4ca8-bdb3-1bf461f8772d

Disclosed is an optical network unit of an access network for converging broadcasttelecommunication by employing IEEE 1394. The telephone and telephone answering device monitors received calls to automatically detect for the presence of embedded secondary information. The feedback value or the reference value or both are generated using noise shaping. The method identifies major thirds and major sevenths in the harmonic context and raises their pitch slightly.

1459828492-7d5688e4-bc93-414f-a0ca-8f169f957912

A fixing device of an image forming apparatus includes a heat roller and a pressure roller. The multi-mode mobile station may become engaged in one or more communication sessions via a first wireless network. The noble metallic tip of the ground electrode possesses excellent oxidative and volatile resistance compared with a noble metallic tip of a center electrode.

1459828492-f1bd7980-0738-4f77-acac-f51587dc787a

Stress enhanced transistor devices and methods of fabricating the same are provided. Accordingly, the raw material of the lead element is injected into the container from a rear end of the adjustment member through the center hole, and solidifies into the lead element, and the lead element is supported on the front end of the supporting shaft at its rear end, and moved in accordance with the movement of the supporting shaft. The method still further includes transmitting the digitized command from the controller to the base station, confirming the command to indicate transmission of a desired control signal by the base station, and transmitting the control signal from the base station in response to the command. A workpiece carrier is provided, wherein the workpiece carrier is configured to hold the second workpiece above the heater, and wherein a diameter of the workpiece carrier is associated with the electrostatic clamping plate annulus. For carrying out a measurement, the waveguide can be immovably fixed relative to the light source and the means of detection.

1459828492-f7d8c60b-daac-49f4-a95b-21499848d99e

Systems and methods of monitoring thin film deposition are described. The device includes a substrate and a polymeric layer including poly or poly supported by the substrate. The feature comparison means disposes the feature points extracted from the existing mark in the predetermined space, and judges that the existing mark is capable of being used as a marker which is detectable from the image, when the number of feature points that coincide with the singular features is equal to or more than a predetermined number. In still another embodiment of the invention there is provided a method of fabricating a semiconductor structure including providing a semiconductor substrate, providing at least one first crystalline epitaxial layer on the substrate, and planarizing the surface of the first layer.

1459828493-75667dd2-2f49-4107-bc11-cd0ce562018e

Illuminated display case for collectibles that can simulate the look and feel of a collectible's theme. In the content use eligibility determination process, a user device performs a checking process of checking a property selection list as the content usage condition information against a property list as user device attribute information. Therefore, the circuit structure of each of the shift registers does not need to be designed a large compensation capacitor therein to substantially restrain the coupling noise effect caused by the clock signal, and thus permitting that each of the shift registers can be collocated with a small compensation capacitor to enhance the output capability thereof. The intercepted browsing starting location is searched in the database. The p-side nitride semiconductor layer comprises, from the active layer side, a p-side wide band gap layer containing a p-type impurity and a three-layer structure comprising a first p-side nitride semiconductor layer, a second p-side nitride semiconductor layer, and a third p-side nitride semiconductor layer.

1459828493-80fa69a8-8ee0-46cd-a20a-9a3222cf7d9e

A thermal printer that includes a thermally conductive sacrificial member disposed between the thermal print head and the web. The system includes one or more gateway devices and a plurality of nodes segmented into one or more routing domains. The first element group 10a and the second element group 20a are connected in series. A linkage adjacent the piston carries a stop; and an actuator is responsive to an end of brake activation signal to cause the linkage to engage the stop with the piston when the piston is retracted from its applied position to its retracted position so as to prevent the piston from moving from the retracted position to the knock-back position. Thus the electric field within the orifice is substantially the same with or without the resistive material.

1459828493-d7dd9980-6da6-4dc6-b340-ca0ab7e64090

A system reads an identifier from a hand of cards to identify the cards. The software is provided with all of the options on an installation medium and when the software is first received only a basic version is installed. A first switch circuit connects an output of the input circuit to the input of the latch circuit. In the trap column, the sample component is condensed while being trapped therein. Lightly doped drain implants are provided in sourcedrain regions of the high voltage transistor in the substrate. The washer is also simple to manufacture in a cost effective manner and easy to assemble in the field.

1459828494-05de80e3-ce7d-4b0f-bfaa-5156ebce03be

A treated substrate with improved availability of a beneficial component for transfer to a target surface and methods for making the same are described. The present invention automatically computes a set of digital band-pass filters matched to the imaging device specifications along with corresponding step-size magnitudes. The computer then sends a signal to one of the conductive traces of the conductor, at one of the ends of the cable, while at the same time monitoring for a signal at the other contacts of the conductor that are in contact with conductive traces of the cable. The curved sheet may define an air inlet of the interior volume. The cord gasket ends also may be secured in a pocket, one or more notches, or in a retaining region. The invention is also directed to methods of determining the effect of a candidate agent on any subject's risk of developing bone or joint disease.

1459828494-ebd9f77e-9f4a-40f2-ae07-d2b19e052dee

An aspect of the present invention includes a method of lithography to enhance uniformity of critical dimensions of features patterned onto a workpiece. The multilayer main body has a first side, a second side, a third side and a fourth side. In certain embodiments, the system is capable of open- and closed-loop operation. The first frame member is rotatable relative to the second frame member, so as to cause forward or backward movement of the second frame member. Furthermore, in the case where a plurality of external devices are connected to the

TV in a multi-connection manner, they are automatically set in a CEC operation. A closeout member coupled to the support rod circumscribes at least an exposed portion of the pivot joint that is aligned with the opening of the headrest.

1459828495-1b450a10-39c7-4d87-ba3c-8e7e8763179f

A turbocharger for an internal combustion engine, particularly suitable for use in a work machine, is provided with a turbine having a low pressure region of minimum static pressure. Thereafter, the first mold 7 is moved along an arrow A direction relative to the second mold 8 fixed to an anchor block, by which the titanium material 20 substantially immovably retained in the groove 13 of the first mold 7 is bent and pushed into a through hole 24 of the second mold 8 by the first guide portion 15, thus being plastically deformed. Using different filtering criteria, some or all legal and/or illegal memory access software instructions may be redirected to mapped memory locations enabling control over memory access functions. Information about the modified portion that is determined as having been referenced to is displayed on a display. The data prompts that are presented relate to the tax documents identified by the user and therefore, are relevant to the taxpayer's specific situation. The scanning device is capable of scanning a user-fillable configuration sheet marked by a user of the electronic device and creating the scan data, with the scan data including one or more configuration indicia.

1459828495-3caf53e8-74c4-403a-86e7-89c31cdc9d54

Methods, devices, and systems for treating the support structures of the body, particularly for incontinence, take advantage of two mechanisms to enhance the support provided by the fascia, ligaments and tendons: first, the invention increases a modulus of elasticity of these tissues, and particularly of the fascial tissues. Once the portable memory device is plugged into a computer, the presence of the device is automatically detected, and thereafter the application programmable interface calls are mapped to access the virtual registry file and the execution files, thereby allowing the execution of the application residing on the portable memory device. The swivel bearing is guided by a tie rod, which is supported on a soft rubber bearing. One of the first and second memory addresses is provided in response to the control signal. The improvement is characterized by a selectively actuatable filter, e.

1459828495-b60f29fa-184e-4910-90a7-544d8d8fa659

Apparatus and methods are disclosed for processing samples on the surface of supports that are contained in support housings. A pulse generator generates a sampling pulse  $S_p$  by detecting a zero cross point of the phase-shifted signal  $S_2$ . A broadcast path is selected from a plurality of generated broadcast paths.

1459828496-2fabbb0d0-706f-4da5-9f5c-7ad89b8a0208

A computer program product embodied in a computer-readable medium is configurable to accomplish execution of an application that is specified and encoded in a markup-based descriptor language. In particular, isolated nucleic acid molecules are provided encoding the pancreas-derived plasminogen activator inhibitor protein. A camera system measures the positions of the points. Sliding portions of the base extend horizontally yet continue to transfer all load weight onto the casters. Because the first and second ports transition in opposite directions, coupling noise is cancelled on a neighboring port that is horizontally adjacent to the first port and vertically adjacent to the second port. As another example, functions of the electronic device can be restricted.

1459828496-6eeb46b0-bd0e-459a-95f1-d82cc72522ac

In a vehicle occupant restraint system provided in association with a vehicle seat for preventing a vehicle occupant from slipping forward under a seat belt in an impact situation such as a vehicle crash, a pair of support members are provided on either side of the seat frame, and pivotally support a pair of arms across which a cross member extends. The invention relates to a method and system for displaying a

series of selected frames to generate a display of surroundings within the vicinity of a cable break. The pretreatment is first to contact the catalyst with the process reactants used in a process for alkylation of aromatics for at least two hours at conditions to produce an alkylated aromatic product and then with a gaseous stream containing oxygen at a temperature and for a time until there is no oxygen consumption. The driving wheel rotates about a central axis resulting in rotation of the parts carrier about an offset axis, which is offset from the central axis. As a result, the gear teeth can be effectively lubricated while minimizing instability in the meshing state between gears. The container and applicator member are configured to be received within an interior space defined between the base member and cap member.

1459828496-9f5f1fb4-2c0b-44a0-9c94-711349bb93fd

A device for applying labels to a label carrier including a movable rack, which defines a plurality of magazine sites, each of the magazine sites being configured for accommodating a label magazine that is suitable for accommodating a large number of labels. The optical cores are spaced apart from one another by an interposer material. Furthermore, the present invention provides systems and methods for identifying an asset within a group of assets.

1459828497-794f1b8a-a5c7-463e-806b-099918cc69d0

A capping device includes an external outer cap adapted to be removably fixed to the exterior face of a container neck, and an internal insert adapted to plug the opening of the neck. The first leg of the 5-pass serpentine flow circuit provides the cooling for the airfoil leading edge. In multiple-dimension partitioning, a database object is divided into partitions based on one criteria, and each of those resulting partitions is divided into sub-partitions based on a second criteria. A multilevel digital output is provided which represents levels of signal in the digital domain and reduces the number of discrete components required to achieve a particular amount of gain. The keywords and/or key phrases that best match what was originally spoken are then used as a final text query for a search engine. The composite material typically takes on a honeycomb structure of an ultra-hard material and cores within the pores of the honeycomb structure bonded to the honeycomb structure.

1459828498-70a7adb2-7ad1-445f-bd95-199ad26609e4

A gob deflector has an entry end for receiving molten glass gobs, an exit end for directing the glass gobs into a blank mold of a glassware forming machine, and a curved portion between the entry and exit ends. A locking device is connected to an end of the body, wherein the locking device has a larger diameter than the cylindrical opening in which the body is configured to be inserted. Each image processing module has an image processing engine and a control section. The LED fixture is electrically connected to an output of the power supply unit and the data input cable, and includes one or more LED assemblies disposed on a circuit board, a data signal output, and a power output. A blade assembly comprised of a cylinder and blades extending from the cylinder is rotatably mounted to the shaft.

1459828499-5d470af3-47de-4c33-99b2-0ddd373086b5

The skin layer provides a neat appearance since it is integrally formed with a one-piece member, and prevents foreign materials of the prior art two-piece member from being introduced into the gap. In a region interposed between a power supply line and a ground line each placed to extend in a first direction, first and second cells each having a transistor and an intra-cell line each for implementing a circuit function are placed to be adjacent to each other in the first direction. In other embodiments, the invention encompasses the option to receive a virtual machine file set of the acquired information for additional viewing and examination by the customer. A second data packet is then created having information forming the first data packet and also a second segment of information identified by a second code. The automatic gain control module adjusts, based on a signal strength

of the input signal, the gain of the variable gain amplifier during the respective cyclic prefix preceding each of the plurality of orthogonal frequency domain multiplexing symbols.

1459828499-b9d22bb1-e3c8-421a-a0ad-4145ace8da80

A printhead maintenance assembly for an inkjet printhead, that has a capper to cover the array of nozzles when the printhead is not in use and, a cleaner for engaging the nozzle plate and wiping across the nozzles. The folding seat combination provides selective positioning of seat, footrest, and backrest components, respectively each between upright and downward positions thereof, to alternately accommodate easy transport of either of additional passengers or materials. The projecting wall projects from an opposed surface of the flange portion away from a distal end of the flange portion. This new and distinct variety has shown to be uniform and stable in the resulting generations from asexual propagation. Invention methods effectively treat bacterial or fungal infections of the nail by utilizing a low viscosity composition having the ability to penetrate through and underneath the nail plate, thereby attacking the infection at its source.

1459828500-351a7a80-4d4f-4446-bbbe-6014455028d6

An elevator includes a set of hoisting ropes supporting a counterweight and an elevator car moving on respective tracks, each hoisting rope having a substantially round cross-section, and a hoisting machine engaging the set of hoisting ropes via a traction sheave. A conical first tapered guide extends from the first entry structure into the first compartment, and a second tapered guide extends from the second entry structure to the second compartment. To facilitate installation and inspection, an air sampling tube is provided with a starter cap. A pivot mechanism is coupled to the other one of the two ends of the steering shaft to create a pivoting axis.

1459828500-649ef191-f633-4450-8899-79be16ab6bbd

A pet fountain includes a water reservoir, and a spout connected with a water discharging end of the water reservoir. An off-line authentication client pre-stores a plurality of pattern element sequences each adapted to form a presentation pattern, and a plurality of verification codes created by applying a one-time-password derivation rule to the respective presentation patterns and subjecting the obtained results to a one-way function algorithm. The system comprises encoder logic at each source processor that operates to associate a unique segment identifier with each of the packet segments before they are transmitted. An insulating layer and an overlying metal layer extend from the surface of the epitaxial layer into the half-trench. The processing system is configured to determine path-losses between the apparatus and a plurality of wireless nodes, to group the plurality of wireless nodes into sets based on the determined path-losses, and to exchange data with at least one of the wireless nodes in one of the sets. The headlamp can be used in several beam modes using a conventional reflection mirror and a discharge tube.

1459828500-b05a795c-1ca7-4771-a83c-f8aafbd2699f

Compositions and methods of making urethane based nonionic associative thickeners are described herein. The matched broadcast program is stored in a broadcast program storage unit. Each of the n data blocks includes at least one of data portions, pointer portions, and control code portions. The connector assembly has discrete first and second passages that prevent communication between the fluid in first passage and the fluid in the second passage. The method of fabricating a high performance photodiode comprises forming a photodiode in the n-well region of a shallow trench, and embedding a dielectric material between the ILD oxide and the photodiode having a refraction index higher than the ILD oxide. The interface has an electronic device for frequency-locking the third frequency onto the first clock frequency.

1459828500-cd908584-cb99-45aa-9d32-f7dabdbfcd7e

A scalable architecture is disclosed for delivery of real-time information over a communications network. Physical characteristics of memory cells in the memory support different sets of data levels. An ionization source in accordance with the subject invention can be used in conjunction with mass spectrometry or other sampling techniques. The first sub-assembly includes a beam splitter sub-assembly that includes a beam splitter and at least one lens.

1459828501-1c967567-6cf6-4920-89a2-17bf11d06ff6

A method and system for debugging using replicated logic and trigger logic is described. In particular, the software generated is capable of causing a particular action to be taken which will result in the transfer of the received data from one format to another in response to certain conditions being met. Further, the rivets and the sleeve pipe are arranged in the same axis. An open position allows for treatment of the well bore while an open to screen position allows for receiving fluid from the well bore.

1459828501-6a3b82d5-e2c7-454b-b30b-d90661353f30

A Wire Bonder has a capillary clamped to a horn. In order to provide the coupling device to permit the routing and the imaging of light in the most confined of spaces with as little loss as possible, it is proposed that the reflecting surface is curved, and at the same time, the coupling device is easy to align and inexpensive to manufacture. Each player would wear a transmitter which the sensor would detect as it crossed the plate, illuminating the lights and sounding a buzzer to indicate when the device is detected crossing the plate. In addition, the agricultural implement system includes a sensor communicatively coupled to the fluid control unit and configured to output signals indicative of the penetration depth of the ground engaging tool.

1459828501-8fed110c-4ada-4444-8c90-0f0ea7737414

A method for operating a convertible top of a motor vehicle. The movement control screed is structured as a control joint for absorbing movement between the first and second masonry coatings and also as a weep screed for accommodating drainage of water from behind the masonry coatings. The video environment is affected by at least one of a position and a movement of the at least one karaoke performer. The liquid space is in connection through a throttle element with a second, fluid-filled liquid space, which adjoins the first liquid space in the direction of the longitudinal axis and is closed by a piston fixed in the outer tube towards the free end of the outer tube in a liquid-tight manner. The method includes executing one or more JH\_SBOX\_L instruction to perform S-Box mappings and a linear transformation on a JH state and executing one or more JH\_Permute instruction to perform a permutation function on the JH state once the S-Box mappings and the L transformation have been performed.

1459828502-394c0697-75f6-4d6a-8358-3f01d7a57c78

A meshed HVDC power transmission network comprises at least three HVDC converter stations interconnected in a first closed path by at least three transmission lines. The requests are sent out to multiple modems and responses return from the modem units to the computer program. Typically, they are mounted by seating peripheral flanges of the lamps and separately electrically connecting the contact elements using slide-on contacts and/or spade lugs or the like secured by screws. An end portion of the body of the fastener is deformed radially outwardly into engagement with the support. The set-top box can connect to the television network on its own.

1459828502-5dacec80-a996-46e9-9cfd-797763ffbe46

A sheet stack loader includes a loading table to support a first folded sheet bundle, an elevator to lift the first folded sheet bundle from the loading table,

and a conveyer to convey a second folded sheet bundle into a space between the loading table and the first folded sheet bundle, wherein the space is created by the elevator. These compositions are used for topical cosmetic applications, particularly to lighten skin. The chamber output passes through a second solenoid driven cutoff valve. The forwarding device transmits the first coherent IO transaction to an external IO device, waits for the first coherent IO transaction to return from the external IO device, and completes the first coherent IO transaction. The prodigiosin can treat or prevent diabetes mellitus without any side effect. In one embodiment, the context switching system includes a context switch requesting subsystem configured to: detect a device request from a thread executing within the multi-thread execution pipeline loop for access to a device having a fulfillment latency exceeding the pipeline latency, and generate a context switch request for the thread.

1459828502-9dc17b94-669c-4d4a-add6-73c40bca6c16

A solar power system includes a preheating device for heating first heat transfer fluid and second heat transfer fluid in separate tubes. The starter system includes a first gear coupled to the engine, wherein the first gear rotates at a speed of the engine. The cover can by cutting away a portion of a housing of the electronic device. The stored information may be information relating to the specific subject or general information regarding normal and abnormal conditions of the eye representative of toxicity.

1459828503-7164b268-a355-45d8-9a29-68183659da2b

The present disclosure provides in a first aspect a mode-locked laser for generating laser pulses. The client device accesses a web application via the internet and transmits a request containing complex scripts to the cloud computing server. In another embodiment, the tax calculations may be executed client-side, while administration of tax compliance data and reporting are facilitated by the central server. The first and second conveyor sections support the longitudinally moving conveyor and the second conveyor section is laterally moveable in relation to the first conveyor section. The surface of the shoulder that points in the direction of the projection is form-adaptable.

1459828503-8d37c22b-39d2-4cc1-b5e1-7b02b6f66722

Methods, systems, and apparatus, including computer programs encoded on a computer storage medium, for distributed forensics analysis. With no fire door key available, the fireman can use the ejection of water from the fire hydrant to open the fire door and enter the fire area for fire fighting. The disk surface has servo information and user data stored thereon. In the third step, the common key  $k$  is calculated as  $k:=f$  for each subscriber  $T_i$ .

1459828503-b0fcd3b9-2b22-4ead-885f-a6e6c956855f

A fuel pump module and method for mounting such to a fuel tank having a limited mounting depth, includes a reservoir, a modular flange, and a compressible coupling element, wherein the modular flange and the reservoir containing the fuel pump are connected offset to each other vertically, by means of the compressible coupling element. A pair of annular seals are each engaged with a respective one of the pair of end rings. This configuration prevents particles generated during wafer transfer or during deposition from adhering to the surface of the semiconductor wafer.

1459828504-425e9a43-f217-41f0-9acb-f29f25401cb3

The present invention provides a nonaqueous electrolyte secondary battery including a positive electrode, a negative electrode and a nonaqueous electrolyte. An inner bag inflates with gas supplied from an inflator. A plurality of reflective members are at least one of formed within an outer layer of the wall member and disposed on an outer surface of the wall member. In other words, data is transmitted from the sender's local loop, through the telephone switching system, and to the receiver's local loop. Also disclosed is a method of reducing insulin resistance in a patient

by administering a compound identified using the method of the invention, and particularly, by administering an antagonist of melanocortin stimulating hormone biological activity.

1459828504-5d1fb682-2b2d-4daf-a87d-34a422a68e4c

A valve stem adaptor is provided for a valve stem assembly having a body with a first end and a second end and having an elongated shaft portion with a first end and a second end and having a passageway extending through the shaft. One process of resolving identity records and detecting relationships between entities may be performed using a pre-determined or configurable entity resolution rules. In another aspect, methods may include tuning to a non-serving channel based on determining that the resource availability opportunity exists. The insulating film which is formed on the capacitor electrode has a trench which exposes part of the capacitor electrode and has an upper surface.

1459828504-b2502bd5-9c7e-42d9-b89c-55f534ae0a10

A system and method are provided for microlithographic writing on photosensitive substrates, and especially high precision printing of patterns, such as photomasks, for semiconductor device patterns, display panels, integrated optical devices and electronic interconnect structures. The switching regulator includes an input switching device, a driver, an inductor, a first output switching device, a second output switching device and an output node. The connection elements each comprise two sheet-metal parts, which are symmetrical to one another, the stop surfaces and the welding surfaces being implemented as edge profiles of the sheet-metal parts, and the welding surfaces being oriented essentially horizontally. The spacer contains an anterior end, a posterior end, a first lateral side, a second lateral side opposite to the first lateral side, a first surface that engages with the first endplate, a second surface that engages with the second endplate. The invention also provides for therapeutic compositions as well as a method of blocking blood vessel growth, a method of promoting neovascularization, a method of promoting the growth or differentiation of a cell expressing the TIE receptor, a method of blocking the growth or differentiation of a cell expressing the TIE receptor and a method of attenuating or preventing tumor growth in a human. A power cycler module turns each sensor driver board on and off such that only one sensor driver board is powered-on at a given point in time.

1459828505-03403d5d-deb6-404b-b317-454717742e38

A system and method provides for one or more of tracking of an object and providing automatic access to applications or data. The object pose normalization method includes: determining a pose of a non-frontal image of an object; performing smoothing transformation on the non-frontal image of the object, thereby generating a smoothed object image; and synthesizing a frontal image of the object by using the pose determination result and the smoothed object image. The method also includes determining associated schemas and rule files with the profile and applying said associated schemas and rule files to the multi-language document. A transfer assembly includes a plurality of transfer suction cups which lift the injected eggs by causing a reduced pressure in a ring around the injection hole while maintaining the injection hole at atmospheric pressure, thus avoiding negative pressure in the egg.

1459828505-0a5b2b79-4e46-41da-b7ce-2dd1e7ed141d

A method and an apparatus for preparing and culturing cells, particularly bone marrow stromal cells. In accordance with the subject method, a probe beam of light illuminates the wafer having the dopants implanted therein. The floating gate is disposed on the tunnel oxide layer, and is constituted by a first conductive layer on the tunnel oxide layer and a second conductive layer on the first conductive layer.

1459828505-3057cd05-f0af-426f-9cb7-02390b943247

The present invention is method for forming a sandwich structure having a pattern of particulate material enveloped between a carrier material and a cover material. The first bulk acoustic wave resonator includes a first electrode and a second electrode and is arranged flatly on the substrate. This first member allows for support, helps an individual move the speaker rack into different positions easily, and acts as a place to hang towels, clothing, and the like.

1459828505-78bb7bc5-2836-46f7-a7fb-6bc7c3f947d3

The present invention discloses a remediation system and method of use thereof for degrading contaminants, including chlorinated organics, volatile organic chemicals, and polycyclic aromatic hydrocarbons. By providing the digital information on unused memory space of a computer system, and providing a process for authorizing access to the information, the information can be efficiently and cost effectively transferred to users. In addition, an interconnect substrate INT includes a connection terminal TER. A pair of walls are positionable at locations outside of the ends of the opening such that the pair of walls and the eyelid are operable to form a fluid seal at least partially around the opening of the catcher.

1459828505-bbc992ff-d962-4955-ba47-562cac6e25fa

For use in a mobile ad hoc network, a first MANET node for routing data packets using Layer 2 information. The method includes specifying clear project schedules that are readily testable for various projects and using labor categories for project schedule tasks requiring labor resources. The capillary device receives input heat that is used to change phase of liquid received from the condenser into vapor for driving the turbine.

1459828506-ce4387aa-8580-4488-8813-c33d1b4c6691

A method for manufacturing a sensing device, such as a bolometer device or other devices. The inner bag 12 comprises an upper and lower chamber 27, 26 and the chambers are divided at a constriction part formed in the middle of the inner bag by a partitioning member 72. A current deviation is compensated among each respective string of the LED array using at least one constant current circuit connected to each of the respective strings. Following dequeuing the string for processing, a pointer to the one command block of the string that was in the common queue is included in a string head pointer list.

1459828507-2c2b59bc-534a-4f98-8ba1-36e2d80c138b

A method for providing information which is performable by a display device is provided. In one example, a bypass desuperheater control valve may be employed. A piezoelectric actuated switch assembly positioned adjacent to the second conveying path selectively engages the pusher elements to divert the selected article to the second conveying path.

1459828507-66839860-585d-4113-b8e3-07ca34dfba7d

A method of making a twist-on wire connector including a method of making a sealant containing twist-on wire connector by in situ formation of a shell around the coil wherein a sealant may be injected into a cavity in the coil prior to removing the shell from the mold to form a ready-to-use sealant containing twist on wire connector without further steps outside the mold. These compositions may be used as food additives, tablets or capsules for promoting health in cases of cancer, pre-menstrual syndrome, menopause or hypercholesterolaemia. The capacitor circuit shunts electrical noise to ground but allows a temperature signal from the temperature feedback device to be received by the system controller. The interface also includes a first input area for receiving commands from the resource administrator for deriving a value for at least one of the access information items. Advancement and retraction of a lancet may be controlled by a feedback loop monitoring the position and velocity of the lancet embodiments of the lancet driver can be configured to follow a predetermined tissue lancing profile. There is also at least one cooking utensil support associated with each of the cooking utensil

openings to maintain the working end of a non-fork cooking utensils above any waste collected in the waste collection tray.

1459828507-809a6c2f-c0b2-41f1-93b8-138152f1162d

An apparatus for sealing a doorway, more particularly, an all purpose gasket structure capable of sealing a doorway against the entry of water, smoke, and fire. A method for handling URA information for a wireless communication device, the device configured to be operable in a mobile telecommunications system, the method comprising, at the device receiving a message to enter a new state, and initiating a URA update procedure dependent on the message not comprising a URA information. Subsequently, all the data from the auxiliary memory is copied to a predetermined spare area of the medium. Finally, liquid reservoirs for the media to be dosed, which are in fluid communication with the liquid columns on the nozzle orifices are provided. The fastening of the switching magnet to the valve housing may thereby be performed in a simple and cost-effective manner. The guide groove has a bow shape made up of an arcuate intermediate curve, and the left end curve and the right end curve which are curved opposite to the intermediate curve, so that the force to be transmitted to the tray changes continuously.

1459828507-e60ca9fe-3bfb-4617-8475-4da4b1884cb3

A water absorbing agent of the present invention has an internal crosslinking structure obtained by polymerization of a water-soluble unsaturated monomer. The shaft has a longitudinal axis and a first diameter. A sense amplifier includes a clamping circuit adapted to connect one of a digit line and an IO line to a fixed logic level in response to an erase signal during a refresh of the selected block of memory cells. The openings are spaced along a central axis of the face of the furnace enclosure member. , an inputoutput trigger voltage spec. Hence, it is possible to reduce the size of the first pumping device and the second pumping device.

1459828508-1440bd27-dffb-44d6-addc-f3ef221b6320

A drive circuit is disclosed including a first feedback circuit designed to generate a first feedback signal from a first voltage to be controlled and a first reference voltage. The connector includes a insulative first housing fixed in a state of being inserted into a through hole, a first terminal held by the housing to face the through hole and connected to the electric circuit. An apparatus includes means for decoding a bitstream based on a property of the subset of bits and the encoding process.

1459828508-a44d63cf-f0e3-419f-bb85-65705f8fd34c

A system is provided for reading and writing sectors which may be realized as either a disk device to the local operating system, or as a virtual disk device to a virtual machine. A host system executes threads to transmit commands through a human interface device interface. The arrangement can be affixed between two abutting walls, between two parallel walls, or also in front of a single wall. The emulsion is preferably combined with a water soluble, rapidly biodegradable microbial food compound and can also be combined with microbes useful in the remediation process. The second valve member has a closed position seated in a second annular valve seat and an open position spaced apart from the second valve seat.

1459828508-a9b5422c-3a9c-4d43-bc43-b6224fcf90bf

A hose assembly including an elongated flexible metal hose attached to a hose fitting having a fitting body defining a passageway for conveying material. The first groove is longer than the second groove and the flap remains connected to the pipe wall at two bridges. One of the shelves holds the monitor and is adjustable to align the monitor with a touch screen panel that is sealed in a window in the front panel. Forensic samples are identified by comparing a sample from an unknown source with a sample from a known source. A variety of types of information may then be

ascertained based on the determination as to the shape and/or displacement of the surface of the object, such as the value of some physiological parameter of a patient, internal and external pressure of an object, acoustical vibrations sensed by a microphone, positions of fingertips on a keyboard, etc. The pedal is formed as a resilient body that is supported by the support structure and the detection mechanism is adapted to generate a signal corresponding to a degree of flexure or change of degree of flexure of the pedal for controlling an operation of the vehicle.

1459828508-e759971e-f2a1-4059-919e-f475e62dc436

A parallel redundant power system and a method for control the same, wherein the power system is composed by UPS modules with outputs coupled in parallel to supply power to a load through a bus. A box end has a groove for receiving the locking ring therein when the pin end is inserted into the box end. Further, the present invention provides a low power consumption semiconductor device and a manufacturing method of the semiconductor device. The material can be removed by laser ablation, etching, or other processing approaches. When the hard disk's idle time meets a dynamically computed power control idle timeout, the disk driver is commanded to power down the device. The ladder system allows the stand to be quickly and efficiently mounted without additional hardware or tools.

1459828509-02813d16-c669-4ddf-afb3-aa7c17e63168

In one form of the invention, a radiation resistant latch has an overall output node, and first, second and third sublatches. A method for detection of perturbations in a medium is also provided. The monitor/control unit then generates a metric value  $\frac{1}{n} \sum_{i=1}^n \text{metric}_i$  for the route selected and adds it to one of identical metric values, which are assigned to routes to the same destination, that corresponds to the route selected.

1459828509-732c280a-4152-422f-abc0-e57663be3e9d

An optical pick-up device that records and/or reproduces information on an optical information recording medium, through the use of holography, can prevent deterioration of recording and reproduction accuracy due to vibrations from exterior or fluctuations in the relative positional relationship with the recording medium. Each radially urging portion has a projection bent radially inward of the disk. Since the starting points of supplying the sulfuric acid, the hydrogen peroxide, and the ultra pure water are different, it is possible to minimize the heat generation due to the reaction between the sulfuric acid with the hydrogen peroxide.

1459828509-bf882c3b-74a2-4efe-b316-804520c2a461

A method of biasing a laser that includes determining a threshold current of a laser and setting a bias current for the laser as a factor of the threshold current. The first means of the present invention provides a mandrel mill comprising a plurality of rolling stands in which two grooved rolls R11, R12 are disposed, respectively, the mandrel mill being characterized in that the roll diameter ratio for the first rolling stand and the second rolling stand is set at a value of 4. The inclusions function as crack initiators during the fabrication process as well as crack arrestors preventing the propagation of the cracks farther into the matrix material. Measurements using a pair of source positions separated by  $k$  pixels establishes the relative response of the  $i$ th pixel with respect to the  $th$  pixel. A fluid sensor is in fluid communication with the passageway. An opening is provided at the rear end to provide an exhaust opening for air that is forced into the conduit, out the perforations and through the bagged material.

1459828509-cb65fa0f-6369-4ffc-b7f6-c424b42cfa8d

A flat mop is used with a disposable wiper. Sharable, actionable labels and codebooks of labels may be defined by a user. The forming device has first and second folding members having angled folding edges adapted for contact by

respective opposite side margins of the web as the web is pulled past the folding edges. Reorientation of the cords can be achieved without stretching them beyond their elastic limit.

1459828510-369e9916-4fd3-4401-8a39-8eca1f2d35d1

A method for making broadband cholesteric liquid crystals with improved bandwidth. A gate dielectric film formed between a floating gate and a control gate of a flash memory device is formed by laminating an oxide film and a ZrO<sub>2</sub> film. The sensor generates a signal in response to a condition inside the body cavity. According to the aforementioned structure, the persons around the portable telephone will permit a user to use it in the noncommunicative mode. The low pass filter receives and outputs the 1-bit PWM signal.

1459828510-7adcd901-a1d4-4aa0-83c3-96600cb74612

Embodiments described herein include an electronic transaction service network service). The arrangement comprises a translator operable in the virtual machine. The digital content is not released to the element if the scaled value does not satisfy the security requirement. The solid core has a deformation, when compressed under a final load of 130 kgf from an initial load of 10 kgf, of from 2.

1459828510-825f728f-1d6f-42f6-971f-c9c144052855

A rotary type rake having a plurality of finger wheel rotary raking elements mounted on a frame and movable thereon from one to the other of a raking position to rake material on the ground into a windrow and a retracted raised traveling position. In some embodiments, the organometallic precursor is a ruthenium-containing, tantalum-containing precursor or combination thereof and may be deposited by atomic layer deposition, chemical vapor deposition and/or physical vapor deposition. The body includes legs and axially guiding grooves thereof provided on its inner circumference.

1459828510-9f7c6c5b-48ab-405e-910c-9cf183b66e26

Systems and techniques for converting an analog input signal to a digital code are described. Embodiments of the instant invention include a monitoring system comprising an activity monitor and a content transfer and display means, wherein the activity monitor comprises an event identifier and a timer. A first matable half and a second matable half of an openable-closeable connection are connectable to secure the containers in either a primary configuration or a secondary configuration.

1459828510-be188e91-d7b5-49d1-8b02-9a2062340647

An analysis device is provided comprising a housing having at least two housing parts, a measuring unit and a processor provided therein for purposes of the functionality of the analysis device and generation of analysis data, wherein the device comprises a lock element for producing a generally fixed mechanical connection between the at least two housing parts. The apparatus includes a clamp comprised of at least two clamp parts. The sliding panel is slidably mounted between the mounting slots of the body and has a distal end selective protruding telescopically from the distal end of the body to abut a plane.

1459828510-f23b5135-7eaa-4e27-b921-649db7bef38f

A delay buffer includes a first shift register receiving input data and having a shift signal input port. A method of treating a well in a cementing operation comprises pumping the spacer into a well ahead of a cement slurry, thereby minimizing or preventing commingling of drilling fluid and the cement slurry. The scanned image is corrected for a divergent distortion based on the divergent distortion angles  $\theta_1$ ,  $\theta_2$ , followed by a correction of the scanned image for a shape distortion in a sub-scanning direction. At least one of the electrodes includes an aluminum fluoride layer facing the other of the electrodes.

1459828511-8539d268-4b99-4d64-b018-4eb97e8ad0ca

A photosensitive resin composition and a photosensitive dry film which are excellent in both sensitivity and stability and are well-balanced in tent strength, resolution and plating non-staining are provided. The tab protection member is provided with tab through-holes and a closing plate section for closing an opening in the male connector housing. The exposed, ruptured cervical air sacs are treated with an antibacterial agent, thereby reducing pathogenic bacteria.

1459828511-aa5113c7-e298-4396-bc88-29895d1a7b3b

A printing unit includes a support structure. The transceiver includes a modulator that utilizes DMT modulation methods for communication over the transmission medium, a demodulator for receiving DMT signals, and a channel equalizer that operates in the frequency domain. Wiring of the optical fibers is configured to connect two single-fiber optical connectors inserted into adjacent single-fiber optical adapters and fiber holes in the upper tier and the lower tier in the same row of the multi-fiber optical connector. The tube is put into the furnace while supplying an atmospheric gas into the tube from the front end of the tube moving direction with one of these gas supplying devices and a gas introducing pipe, which is arranged inside the furnace, and this tube is maintained at 650 to 1200° C.

1459828511-bc017741-9b5b-4382-aae2-97a6f86b9854

A method used in a transmitting device comprising a non-linear amplifier and a digital predistortion circuit. A composite lens has a first lens component and a second lens component. The sign includes at least one optically transmissive layer secured to the reflective layer such that the reflective layer is positioned between the optically transmissive layer and the body portion. In one embodiment, the three-dimensional tool space moves with or is linked to the virtual person's body so that it travels through the environment with the virtual person's body.

1459828511-dc0cbb48-c1e5-470f-8d26-a93c33495e0a

In an embodiment, a bicycle saddle fit system comprises first and second supports, a substrate coupled to the first and second supports, and a measurement gauge coupled to the substrate. The miniaturized satellite transceiver includes an integrated GPS receiver configured to receive communications from the GPS satellite, a satellite modem configured to transmit and receive communications from the communications satellite, and an operating system. Consequently, the curve of storage modulus  $v$ .

1459828511-fea9bc13-fe09-4033-886a-43fb95bf5603

A gas separator is configured to separate gas from a two-phase fluid. Data to be analyzed is loaded from an external source the computer displays the data in response to user input using a variety of methods including data tables, slices of data spaces, hierarchically navigated data spaces, dynamic slice tables, filters, sorting, color-mapping, numerical operations, and other methods. Thus, when an entity or layer changes, the impact to the performance can be asserted, and later validated through the specific measures. The pump includes a housing having an inlet and an outlet. A member to be heated sandwiched between the conveying members is moved in direction  $d_1$ , and passes through the opening in direction  $d_1$  non-parallel to microwave traveling direction  $d_2$ .

1459828512-16001097-e741-4dcf-83b9-64251f7f8b7f

A dynamic range compression apparatus that uses a look-up table is capable of dynamic compression that compresses the peak input value to the full output range, even when image signals with variable D-ranges are inputted. The garment includes a front panel; a back panel; and at least one tummy control panel formed of a low-stretch, high pre-tensioned fabric attached to the inside of the front panel beneath the waistband of the front panel. The control circuit includes a memory storing the characteristic information and variably sets at least one of the limiting voltage, the voltage-limiting time period, and the constant current in

response to the characteristic information.

1459828512-79bce5d6-96e7-4ae0-8aa0-ecb352683b2b

A tire for a vehicle wheel includes a carcass structure, a belt structure, and a tread band. The present invention also proposes a base station and a user equipment which will be used to implement the inventive multiuser multi-input multi-output scheduling method. The cut is fastened in the larger circle of the aperture member. The preferred arrangement includes friction enhancing surfaces on the corresponding portions of the socket and the wedge to facilitate maintaining the load bearing member in place. \u201cSimultaneous\u201d stimulation involves sequentially stimulating the patient with the multiple stimulation settings such that the patient receives the cumulative effect of each stimulation setting, while not perceiving the transition from one stimulation setting to another.

1459828512-9137ed5f-2a4c-49be-9dee-a096df23fa02

Apparatus and methods for oscillation suppression are disclosed. The optical disc device comprises two types of holding mechanisms that form either a single disc mounting space or a cartridge mounting space according to a shape of a single disc or a cartridge to be mounted in the tray, and hold the single disc or the cartridge in the respective mounting space. A dividing wall is in the passageway and has an upstream end in an outboard half of a span of the airfoil and has a plurality of vents.

1459828512-e55113ef-f1b9-465f-88b7-19a71695374d

A method of tracking a vehicle including receiving vehicle information at a call center from a telematics unit via a wireless network, determining whether the vehicle information is associated with a vehicle station identification for a missing vehicle on a vehicle tracking list and initiating vehicle tracking based on the determination. A side plate is connected to an end of the box and a coil spring is disposed to the side plate. A dispenser is coupled to the bottle and arranged to communicate with dispensable product held in the collapsible bag. Hydraulic lines are fed to either side of the piston to effect actuation in either direction. Upon determination by the device determination section that a USB compatible device is connected, the DC-DC converter supplies power to the USB compatible device. The preformed shape includes a first arc, a second arc, a third arc, a fourth arc, and a generally straight terminal portion.

1459828513-0a1af8a4-f33c-4dff-a006-cfcba32da053

In an embodiment, a multi-carrier signal is received over a channel. A mounting device is secured to the wall of the manifold. The criteria when the occupant enters the vehicle is different from when the occupant exits the vehicle.

1459828513-1dae5703-9761-49b3-a478-ba8f7dd5cef3

A transition encoded dynamic bus includes an encoder circuit at the input to the bus and a decoder circuit at the output to the bus. The circuit includes a plurality of phase locked loop circuits for generating a plurality of spread spectrum waveforms. The first dispensing rib and the second dispensing rib define a dispensing orifice. The tube structure has a proximal end and a distal end. The orifice tube has an orifice formed through the orifice tube body and the flange, which has an inner diameter smaller than the inner diameters of the first and second return tubes, so as to control pressure and speed of the hydraulic fluid flowing through the orifice from the first return tube to the second return tube, thereby reducing noise.

1459828513-26c5a0ff-1213-447c-be66-cc10e2221e76

A method and apparatus for making an RFID article such as a label, tag, ticket, envelope, carton, inlay, etc. The duty cycle and overlap of outputs of the positive and negative power supplies are controlled, and an overlap that achieves a desired offset voltage is determined. If multiple requests are identified for the streaming

file during the time interval of interest, then determining, from the determined segments of the streaming file accessed by each of the multiple requests, at least one unique segment of the streaming file that was most recently accessed within the time interval of interest. This is followed by concurrent transformation of the data in multiple execution threads. The dial desirably is also preformed and then attached to the keyboard. The at least one module includes a charting module.

1459828514-3cb89c5f-52d3-4a95-a0ce-981ae32273df

A transfective liquid crystal display and method of fabricating the same. The magnetic field sensor measures two components of the magnetic field produced by the magnetic field source. Since the auxiliary wiring line is formed in the same layer as an electrode that constitutes a TFT, the electric resistance of the wiring line can be reduced effectively and waveform rounding of an applied high-frequency signal can be reduced without increasing the number of manufacturing steps. For second input chroma values above the threshold chroma value, each second input chroma value is mapped onto a respective one of a plurality of second output chroma values such that a first non-linear relationship exists between the second input chroma values and the second output chroma values. A polishing pad support is positioned to carry the first polishing pad proximate to the carrier and is also configured to carry a second polishing pad having a polishing surface with a second shape configured to remove material from the first face of the workpiece while the workpiece rotates about the axis. The device includes an n-type semiconductor resistance region formed in the surface of a compound semiconductor substrate, and a p-type buried region formed between the n-type semiconductor resistance region and a substrate region 21S of the compound semiconductor substrate.

1459828514-6c0f17e7-951c-4447-88f6-d0376848bd12

The invention provides a process for selecting wheat plants and generating wheat lines which exhibit genetically-controlled glyphosate herbicide resistance in the absence of genetic engineering, wheat plants that are glyphosate herbicide resistant, and the naturally-occurring genes that confer glyphosate herbicide resistance exposed by the selection process. The beads are encoded to indicate the identity of the receptor attached, and therefore, an assay image and a decoding image are aligned to effect the decoding. The system may further include a reporter to notify a congestion source of the layer 2 endpoint buffer based upon the buffer data packet occupancy and/or rate of change in the buffer data packet occupancy. The base and photoluminescent panel are flexible in a transverse direction allowing the wall marker to be stored in roll form in an unassembled configuration. The selected synchronizing signal is used to generate a control signal that synchronizes a stereo viewing device to the selected video stream. A selector function uses selection criteria to select accounts and events from the relational database in order to generate a number of inputs for profitability calculations.

1459828514-b424abf4-3dd6-4ee1-80f6-10617ecc7d7f

There is disclosed a semiconductor storage device comprising a trench capacitor wherein a high dielectric-constant insulator is used and formation of a depletion layer in a capacitor electrode is suppressed. The method initiates with defining a pipeline of processors communicating with a distributed network and CPU of a host system. At the same time, with four-stage pipeline to just enough to meet the speed requirement, the hardware cost for the new designed Viterbi decoder is reduced compared with single-staged decoding. A camera lens module and a hinge assembly are selectively disposed in one of the first and second hinge housings. According to the present invention, a polarizing plate, which exhibits excellent polarizing properties and durability, has high surface hardness, and may be formed as a thin plate, may be provided. An electrical power source, which may take the form of a battery, is disposed within the device and a selectively activated light source, which may take the form of an LED, is operably coupled with the power source.

1459828514-ce88ded9-95e8-4275-8a8a-569ae5a94f82

The present invention relates to unsupervised, supervised and reinforced learning via spiking computation. A preferred embodiment of the invention includes an enhanced notification server that receives a notification of the message from the voicemail server, queries the availability of an instant messaging client via an instant messaging presence server, and forwards the notification to the instant messaging client via the instant messaging presence server if the instant messaging client is available. The unsymmetrical part of the lead frame is visible through the observation hole. The pulse forming network includes wedge-shaped capacitor modules that, when juxtaposed, collectively form a substantially annular shape having generally cylindrical inner and outer surfaces.

1459828515-4cd99492-9a0c-4846-a678-8eb7a0449ae9

An extension of an inverse inference search engine is disclosed which provides cross language document retrieval, in which the information matrix used as input to the inverse inference engine is organized into rows of blocks corresponding to languages within a predetermined set of natural languages. The variable tension risers allow several subsea wellheads, in water depths from 4,000 to 10,000 feet, at lateral offsets from one-tenth to one-half of the depth, to tie back to a single floating dry tree semi-submersible platform. To simplify conventional modulated battery chargers, the PLL or other methods of phase correction are removed, reducing most of the calculation requirements for adjusting the phase angle, thereby reducing the piece count and ultimately cost and complexity. In order to encapsulate CDPD block data using the TIAEIA-136 standard, an encoding step is performed on the sending end that includes constructing a CDPD block comprised of CDPD data, assembling an TIAEIA-136 frame leaving the data fields of the frame empty, and placing CDPD block data in the data fields. The method further includes generating a desired motor torque signal for controlling a power steering motor in the parking assist operational mode utilizing the controller, based on the desired front road wheel angle signal and the parking assist request signal.

1459828515-9d63408e-f106-41da-a5ee-83b1ee180cdc

The present invention provides a pixel which utilizes a charge multiplying photoconversion element. For example, a computer-implemented method for generating a recommended query for a conversation system in response to an original user query, wherein at least a portion of the original user query is not understandable to a query interpretation process, includes the following steps. An impregnation holding member holding a lubricant is embedded in the embedding portion. The base includes a base opening. The present invention proposes a simple and flexible scheme for the adaptation of the performance of a communication device in the random access procedure in the case of certain events.

1459828515-b36d6d90-d1f5-4d2c-a26e-b775fb4cccb7

A trampoline has an enclosure which includes a wire ring; a plurality of connectors connected to the wire ring; and a plurality of support poles. The device can inter alia be used for the diagnosis of alkali metal polarisation in a polariser for inert gases. A user interface for inputting purpose parameters specifying a document variation and a selection engine for utilizing the current values of the purpose parameters for generating customized versions of the document.

1459828515-d527e421-c68b-4b3f-a201-d3603133fd6c

During engine braking of a turbocharged internal combustion engine, the exhaust gas pressure increases and this is used to pressurize the seals between the turbocharger shaft and the bearing housing so as to prevent oil leakage into the compressor housing. The second fastener is suitable for affixing to the first fastener when the bottom surface of the panel is placed upon a bench and the strap is extended along an underside of the bench toward the front side of the panel. The proteinaceous substrate includes one or more proteins and an adhesion modifier, and may also include one or more of: a pasticizer, a carbohydrate, or other modification agent. The gain setting may be used to generate the headphone

correction filter.

1459828516-6006a458-6fdb-45a8-8029-4d226f417ed2

Transparent sheets of acetate carrying a band of adhesive on the reverse side adjacent to one edge can be used for making notes on text and illustrations. The second memory structure is operable to identify a repeated issuance of a forward program redirect construct, and issue a next program instruction already stored in the second memory structure if a resolution of the forward branching instruction is identical to a last resolution of the same. The LED lighting device according to the embodiment includes a lower case; a light source unit disposed on one side of the lower case; a light guide plate disposed in parallel with the light source unit; and an upper case disposed on the light guide plate and coupled to the lower case in an attachable and removable way. A first rolling bearing is disposed between the first rotary shaft and the case and rotatably supports the first rotary shaft. Also included are an analogous NAND-gate based circuit, a circuit combining the NAND- and NOR-aspects, a circuit with a ring oscillator where the inverters may be coupled directly or through inverting paths, and circuits for measuring the bias temperature instability effect in pass gates.

1459828516-fb2dbd77-6929-49bd-bcf6-18107214a69e

The present disclosure provides a method for improving image on paper registration in an image printing system. The steering rack is secured transversely to the bogie beam and is longitudinally spaced apart from the landing gear axle. The split keyboard is configured to receive input that is shown on the rectangular display. And the scanning and exposing may not end until the speeds of the wafer stage and the reticle decrease to zero. The control circuit 20 in the power supply device 10 which outputs different direct current voltages includes a voltage setting unit 22 for determining the setting level of a second direct current voltage V<sub>BGP</sub> which has a potential relationship with the setting level of the first direct current voltage V<sub>CC</sub> which is one of a plurality of the different direct current voltages.

1459828517-03ad68b5-b220-437b-8e99-459f841832e8

The present invention provides organoselenium compounds comprising dibenzoselenophene, benzobiselenophene or benzociselenophene and their uses in organic light emitting devices. The plurality of U-shaped magnetic circuits being comprised of a first stator segment, a second stator segment, and a plurality of stator yokes. The first bumper element includes a protruding portion interposed between the seat bottom surface and the seat suspension, the protruding portion supporting a portion of the seat from the seat suspension. A ratcheting system coupled to the master grip to receive the alignment of the master grip and coupled to the slave surgical instrument, to control motion of the slave by continuously reducing the alignment error, as the master grip moves, without autonomous motion of the slave surgical instrument tip and without autonomous motion of the master grip. The flow drill screw also includes a stud extending from the shank along the longitudinal axis and away from the first shank end. The deflated balloon portion is withdrawn from within an expanded medical device a predetermined distance before the remains of the ruptured sheath begins being removed from between the expanded device and a vessel wall.

1459828517-2f075e1c-0aec-4782-9cf6-744ab6200d7c

A method for processing data may include receiving packetized data via at least one of a plurality of input ports in an Ethernet switch. The surfactants are of particular advantage in resolving crude oil emulsions of the type encountered in desalter and similar apparatus designed to extract brines from the crude as they partition to the aqueous phase in the desalter. The hard mask is then removed from the gate structures in the non-core region.

1459828517-f9d79431-103a-42b0-b122-2fa9d8636f64

A terminal and a method for prompting service failure in the video telephone

service are disclosed, and the terminal comprises a processing module, a storing module and a setting module which are connected orderly. The nanowire catalysts are useful in a variety of catalytic reactions, for example, the oxidative coupling of methane to C2 hydrocarbons. The object management system preferentially selects the distributed data storage units for performing the file access requests according to the external inputs/outputs with which the file access requests are associated. Loops are provided on each side stringer, and the cord extension segments are each passed through one of the loops before being cinched to tighten the cording against the boot. A set of first fill elements are uniformly arranged along the boundary outside of the \u201ckeep out\u201d distance, and a set of second fill elements further from the conductive line than the first fill elements are arranged in a pattern that would be uniform, but for having some fill elements missing from the pattern. A tag at the side of the reader is aligned in the direction of travel by rails on the conveyor.

1459828518-12011985-ff3e-4429-b7b8-ced5367f2173

A reinforced composite material based on aluminous cement and tabular alumina or corundum, reinforced with glass-fibres, method of preparing the same, its use for preparing manufactured products, as well as manufactured products formed in this way and their use. The sign system includes a support for maintaining a sign system at a predetermined orientation. Each light guide portion of the plurality of light guide portions is surrounded by light emitting regions of the plurality of light emitting regions.

1459828518-65a92798-005a-4907-9d95-93e17e785916

A patch for a therapeutic electrical stimulation device includes a shoe connected to the first side of the patch, the shoe including a body extending in a longitudinal direction from a first end to a second end, and having first and second surfaces, the first end of the shoe defining at least two ports, and the first surface of the shoe defining a connection member. A DC bias potential which is different in magnitude from the DC self bias potential is applied to the coil from a DC voltage source. A digital residue signal of the output of the one or more initial pipelined analog to digital converter stages is sampled.

1459828518-87365777-dfc9-4ddd-b0a6-944bc0fc1f0d

The present invention provides 3-benzyloxy-2-aminopyridine, 3--2-methyl-9-hydroxy-4H-pyrido1,2-apyrimidine-4-one, 3--2-methyl-9-hydroxy-4H-pyrido1,2-apyrimidine-4-one and 3--6,7,8,9-tetrahydro-9-hydroxy-2-methyl-4H-pyrrido1,2-a-pyrimidin-4-one useful as intermediates for the preparation of paliperidone. A determination is made as to whether access to a resource is permitted, by at least comparing the collection of multiple user credentials to a threshold combination of user credentials to be satisfied to access the resource. The method may then determine the longest edge or major edge of the triangle and also determine the direction or axis of the longest edge of the triangle. The module support may also be hung on a wall or column using hanging elements, e.

1459828518-ba72f3a8-22a4-4bb7-bf88-c9715dd3952e

A semiconductor package has a substrate having a first surface, a second surface, and a through hole opening. A user may specify or create source code using a programming language. A testing process is performed to ensure functionality of the wireless handheld device. Yet another aspect of the invention is a dual dispenser including a mechanism for dispensing the soap, a mechanism for actuating the dispensement of soap, a mechanism for accelerating the dispensement of air freshener and a mechanism for actuating the mechanism for accelerating the dispensement of air freshener. By using such a cyclic design, an organization will not need to stock different parts for each band and thus significantly reduce the inventory cost. The shaft holder bracket has means to secure the elongate shaft from rotation and sliding.

1459828519-da2cb772-bf16-4375-a09e-9c43f91e65e6

A pack for carrying school books and other items, with the weight substantially balanced between the front and back of the wearer. First and second signals corresponding to at least two beams may be generated or received. , R3 constitutes linear or branched chain alkyls, or a group of the general formula  $\text{R}_3\text{X}$  Where X is preferably H, n is 0 to 3 and the dashed lines represents an optional double bond. The connection members comprise first connection members 21a and second connection members 21b.

1459828519-eabd51dd-6f32-457e-b895-f6fc1c1c5142

A system and method controls injection of a reductant agent in a selective catalytic reduction system. The method includes positioning a part having a part axis relative to a measurement axis at the part inspection station and scanning the positioned part with an array of planes of radiation so that the part occludes each of the planes of radiation over a measurement interval of the part to create a corresponding array of unobstructed planar portions of the planes of radiation. Here, the DAI information includes at least one DAI value, in which varying combinations of the number of downlink control channels and the priority value are overlapped and mapped. A label may then be generated representing a first measurement parameter observed from ones of the plural cellular sites at one of the selected geographic locations, the label including a relative ranking by cellular site of the first measurement parameter.

1459828520-20e258a4-2358-40c3-a746-59be7486ea5d

Provided herein are isoindoline compounds, pharmaceutical compositions comprising one or more of such compounds, and methods of their use for treating, preventing, or managing various diseases. An upper arm and a lower arm are mounted to the mounting bracket for pivoting motion about a first vertical axis. The light-blocking layer has a first opening portion formed in a storage capacitor region. The gussets may be offset from the center of the bumper beam and overhang the edge of the beam. The first and last freezer packages in the stack are proximate to the first and second electrodes, respectively.

1459828520-3f5002e6-2739-40db-b8c4-42eb0020c824

A wireless end-user device has a wireless wide-area network modem and supports multiple wireless network types. The load-bearing element, with a patient tabletop mounted on it, can be leveled by a continuously adjustable leveling device. The thermal insulator is formed from a pouch-covered thermal insulation material. The return beam is directed onto a multichannel detector. This allows the printhead to use smaller heater elements with lower power requirements.

1459828520-51da42f2-5657-4610-998a-2063ad2f4f03

A workpiece is implanted to affect growth of a compound semiconductor, such as GaN. The JRE comprises a Java Virtual Machine and Java runtime libraries components and is capable of executing a player application for presenting content that can be presented through a Java program and downloaded from a content server to the client. An optimization function is determined based on the input image and the regularization strength for each pixel thereof and assigns a value for each pixel, by which the determined optimization function has the minimum value, to the corresponding pixel of a restored image to be generated. Multiple phase-to-phase signals may be encoded and transmitted between different pairs of the power cable conductors, or the same data may be encoded and transmitted in multiple phase-to-phase signals in either a single-ended or differential manner.

1459828520-f4e21bf5-0b78-42a3-9d30-1da6290b0ce6

Footwear including removable and replaceable outsole members may include: an upper member; a midsole member, having an exterior surface not designed for performance use in direct contact with the ground, fixedly engaged with the upper member; and an outsole member designed for performance use in contact with the ground removably

attached over at least a major portion of the midsole member. A splice trigger is received at a pre-conditioning encoder. Of fourth to sixth IDTs, the fifth and sixth IDTs are connected to a second balance terminal. When a newly created object is being added to a full cache where each object is enrolled in a transaction, one or more active objects may be passivated from the cache based on various criteria to make room for the new instance to be added.

1459828521-8e725c43-2bbb-47c1-b3bb-66ef57fc049d

A wavelength multiplexed holographic system includes a wavelength tunable blue-violet laser and a controller for wavelength multiplexing. An intermediary located between a client and a server receives a response from the server to a request of the client to setup a media stream. An actuating member is slidably received in the handle for actuating the detent member to engage with the driving shank. The present invention includes a removable sensor assembly.

1459828521-a3443797-cd12-42bb-99a9-c21e9cd45948

A communication system is proposed for transmitting at least one of the data, the program, and a combination of them from a host facility to a communicator such as a communication terminal device. A grip member with a first pivot coupling selectively couples to a second pivot coupling on the frame and a pair of stabilizer legs are suspended below the frame so as to balance the camera on the grip member. The face plate of the controller, in one embodiment, has a recessed portion with terminals for connecting the low voltage conductors. In another embodiment, the insert is embedded in the blade lamination with an inner part stuck to the body of the insert.

1459828521-be9c69d5-1bc1-4241-a249-b2d32488342c

A water-saving toilet is disclosed. In at least one embodiment, first image data is reconstructed in each case from the measured data sets such that a series of first image data is available. Each of such fasteners has male and female members detachably and directly mated along a width of the body and between the longitudinal sides respectively. The upper end of the pillar is covered by a cap and sidewalls of selectively etchable materials so that gate and source connection openings can also be made by selective etching with good registration tolerance. This allows for contactless testing of the integrated circuit, whether the circuit is in die form, wafer form, or packaged form.

1459828522-0f273ae8-aec5-47a9-ba18-58593764d407

An apparatus for helping to protect an occupant of a vehicle includes an inflatable vehicle occupant protection device inflatable between a vehicle surface and the vehicle occupant. Components to be cleaned are stored within or supported by a dedicated cassette before they are placed in a receptacle of cleaning liquid. The second section extends in a spiral along the axial centerline of the drum adjacent to the first section.

1459828522-e1af0803-6333-4ece-897b-1dd9d9e4505b

A semiconductor device includes a semiconductor substrate having an active region and an isolation region. The method further includes determining a transformation between the first image and the second image. The heat transport structure is formed as a cavity or at least one fluid passage arranged radially, in parallel, as a matrix, or a serpentine channel.

1459828522-ec10e626-0088-4a46-b07c-08a4a43b5db3

A regulator assembly is provided for use in a respirator system to supply a regulated flow of air to a respirator head piece. The front panel is partially surrounded by an air intakegas exhaust system. The magnet can rotate about a rotational axis of the cylindrical shape. In one embodiment, the media control valve of the present invention includes a valve body having a media inlet and a media outlet. In an embodiment in which the data processing system is implemented

as a multi-node system such as a NUMA system, the first portion of the main memory is in the main memory of a first node of system and the second portion of the main memory is in the main memory of a second node of the system. A first flow of the fluid travels through the annular gap, and a second flow travels through the longitudinal channels.

1459828522-f9e9130a-05fc-4e50-b265-c4707e706c40

Some embodiments include semiconductor processing methods in which a copper barrier is formed to be laterally offset from a copper component, and in which nickel is formed to extend across both the barrier and the component. A laser source illuminates the target and the Doppler shifted return beam is incident upon a window system at an angle and is transmitted therethrough. A cradle on the front blade and on an outrigger of the crane is used to transport a pole. Responsive to loss of the power source, the UPS may be used to maintain operation of the generator as an induction motor while the prime mover accelerates up to a speed sufficient to drive the generator as an induction generator.

1459828523-598d1427-fbe9-4bb5-b4ec-6d6a95fd1b4d

Anti-reflective compositions and methods of using these compositions to form circuits are provided. In one method, both a predicted predicate value for a predicate and a confidence value for the predicted predicate value are determined. The identification cells harboring certain strains of HCMV, such as HDu, will provide a novel mechanism to identify cells that are at risk for undergoing oncogenesis. One or more annular sealing ridges extend aftwardly from the plate rim.

1459828523-66c31feb-20b8-42da-a542-1cca0a3d2831

Various methods and systems for testing electric automotive drive systems are provided. Control unit 100 sets the target shifting required time based on parameters indicative of the state of engine 1 or the transmission, and corrects the command value to the friction clutch so that the required shift time can approach the above target shift required time. The second semiconductor region is provided on the first semiconductor region, and includes silicon carbide. Citrus greening disease is able to be cured by spraying the treatment liquid onto leaves of citrus trees infected with Citrus greening disease or by pouring the treatment liquid on the roots of citrus trees infected with Citrus greening disease. This is accomplished by a valve member defining a channel that is coupled to a port at the first end while pivotally movable to intersect different ports at the second end. Subsequently, the first computing device disassociates the application of the first computing device from the data structure of the connection.

1459828523-c667d54f-7adf-4b43-8a59-46484e1bcf33

An enclosed bicycle drivetrain is provided that produces a range of drive ratios suitable for any riding purpose. The subject innovation can enable access to unstructured data directly from within the data mining engine or tool. The receptors can include at least one protein receptor and at least one nucleic acid receptor.

1459828524-1635d812-ccd8-44f5-a020-8878b80cab4d

Semiconductor processing methods of forming integrated circuitry are described. In one embodiment, a catalyst withdrawal apparatus for removing catalyst from a FCC unit includes a vessel coupled to a flow control circuit. In one implementation, the signal processing arrangement is programmable with complex high-speed signal processing parameters that can be downloaded, for example, via the Internet in response to an end-user request. The holder is disposed on one side of the base and connected to one ends of the supporting units.

1459828524-191b1102-a05d-41a1-a3b9-c2fa5655260a

A networking device includes a legacy preamble injector that inserts a legacy

preamble based on an indication that a legacy device is coupled to a common network. Embodiments include, self-aligned polysilicon contacts done by timed contact etch, by a two layer dielectric, by adding a dielectric etch stop layer, and by partially planarizing a dielectric or etch stop layer over the gate layer. The resealable stopper defines a heat-sealable portion to allow the stopper to be penetrated by a needle or other filling device to fill the syringe with a medicament or other substance, and in turn allow the hole remaining upon withdrawal of the needle to be heat sealed by transmission of laser energy thereon. A remote position reporting device of the monitoring system can be part of or attached to any mobile object such as a child, a skier, a car, and expensive items. The pitch pattern for the novel track has a six pitch tread pattern which repeats every successive sixsomes of pitches. Each of a plurality of rods is attached to the loop and extends downwardly therefrom.

1459828524-909f0b3e-a9a3-4031-bb43-0b4879ff50b2

A mother glass composition for graded index lenses, comprising the following glass components in mol %: 40\%SiO<sub>2</sub>, 1\%TiO<sub>2</sub>, 0\%MgO, 2\%Li<sub>2</sub>O, 2\%Na<sub>2</sub>O, 6\%Li<sub>2</sub>O+Na<sub>2</sub>O, and from 0. A first set of openings are formed in a first photoresist layer coated on the substrate using a first mask. In accordance with a second embodiment, a contact lens with the desired distance corrected ideal turtleback shape on its anterior surface is positioned over the cornea. In preferred embodiments, high frequency current may be passed through armature windings of the motor-generating circuitry to induce surface currents into the periphery of the rotor. In addition, the present coupled cavity circuit operates on an electron beam to interact with the third space harmonic of the second passband of the electromagnetic signal.

1459828524-a609a09f-0502-4c01-9ffb-cd05a4f755cf

An image sensor with matrix readout includes a matrix of elementary photodetectors connected through at least a bus to a remote integrator which converts the signal of each elementary photodetector into a voltage. Programming with high viewership statistics is transmitted substantially continuously and programming with lower viewership statistics is transmitted on-demand in response to requests by users by way of a subscriber station. A bath of conductive bonding material is made inside a tray-like metal chassis of the assembly.

1459828525-115b7c68-4afb-4ceb-935e-8f80591b167d

A code-reading apparatus determines the type of data in recorded code data and carries out appropriate processes depending on the determined type of data. A position measuring arrangement includes a first element and a second element that moves in relation to the first element, wherein the rotor and the first element are connected, fixed against relative rotation, with the shaft. This country information may be a Mobile Country Code that is broadcast by the WWAN. The filtered RAB may be compared to a threshold to determine a mode of reverse link data rate determination.

1459828525-8bce4631-f199-47ec-a95c-61188016c960

In a satellite communication network, a link between a remote terminal and a traffic processor located at the hub may be used for providing services over a satellite link, such as traffic routing, protocol acceleration, data compression and data encryption. The present invention is also related to the nucleotide sequence encoding said amino sequence, the inhibitor directed against said sequences and their use in the diagnosis, treatment, and/or prevention of lung injuries or diseases and oxidative stress-related disorders. The upstream muffler and the downstream muffler are arranged in parallel, and the second exhaust pipe extends from the downstream muffler through a region that is located closer to the engine than the first exhaust pipe. Patients with atherosclerosis or cardiovascular diseases can be treated with the dimer. These steps are repeated for each pulse signal received until a delayamplitude map of the transmission channel between the

stations is complete.

1459828525-bd433bc9-03d3-43e9-9d0d-832678ce6ee9

Disclosed herein is a vibratory gyro-sensor including a vibratory section, a synchronous detector which synchronously detects a detected signal from the vibratory section in timed relation to a timing signal for synchronous detection, and a timing signal output section which outputs the timing signal for synchronous detection. The target signal is detected on the rising and falling edges of the reference signal. The specifying unit specifies a correction amount of the image data for keystone correction processing. A database is configured to store the first set of user contacts and the first set of priorities. An essentially closed ring profile, into which the collar projections are integrated, is created when the collar is hemmed. Further, the bathing composition is an environmental-friendly composition because the loess-containing water discharged after bathing flows into a draining path, thereby purifying a contaminated river and recovering contaminated soil.

1459828525-e2cec46b-4768-4233-ba5c-312ff0fbb3ad

Call center supervisors require information about the performance of call center agents in order to manage them appropriately. The determined transportation modes may be used to tag the GPS data with transportation mode information, and/or dynamically used. The frame includes at least a first member and a mating second member which together define the opening for the media.

1459828526-0ac7d886-495a-4461-bcc1-ee1cb029abc8

A system and method for providing file sharing using an instant messaging application are described herein. A system that incorporates teachings of the present disclosure may include, for example, a media receiver having a controller element to generate a Media Program Guide that groups media programs according to a redundancy of media programs and a viewing history of a subscriber of the media receiver. And the enlarged wall is outside the second closed line segment and is inside a third closed line segment which encloses the second closed line segment, wherein either the third closed line segment is dissimilar to the second closed line segment or a gravity center of the third closed line segment is different from that of the second closed line segment. The architecture further includes a synchronization buffer in each input signal path for transferring the input signal to the clock rate of the time slot interchanger.

1459828526-85aa70cd-ab3f-40c2-9904-acd2074271d2

A precision high-frequency capacitor includes a dielectric layer formed on the front side surface of a semiconductor substrate and a first electrode on top of the dielectric layer. This splicing method splices opposing end faces of two optical fibers by fusion, and heats a formed fusion splice to match mode field diameters of the two optical fibers in the fusion splice, wherein the two optical fibers are fixed with an axial tension applied or not applied to the fusion splice, after the formation of the fusion splice, before the fusion splice is heated. Once the double tread is cured and cooled, it is cut along the centerline with a double tread separation apparatus to expose a soft non-oxidized inner rubber. Therefore, generation of a moat in the trench insulating film is avoided. The shafts of the extruder are designed with a double lead in a degassing zone, and with a triple lead in a pressure build-up zone.

1459828526-a1fd5f6c-9c90-4198-9c2d-148cf325eb2a

A disposable absorbent garment includes a front body panel having a first waist edge and a first crotch edge defining a first lobe having a first profile in plan view that extends outwardly relative to the first waist edge. The platform includes a portion of an electrochemical control. The spool includes an intermediate land having a first side and a second side opposite the first side. The transitioning passage further includes a tapered passage section which tapers toward the vertical

channel, and a wall part which partially Ago confines the tapered passage section at the outermost turning side. The e-mail firewall employs signature verification processes to verify signatures in received encrypted e-mail messages.

1459828526-bf6e5d9f-c025-47a9-8d60-228446d9669a

A method for minimizing the life cycle cost of processes such as heating a building. An input arm assembly is provided with interchangeable vacuum leads. Also disclosed is a process for the preparation of solid rasagiline base. A trap door is disposed on the bottom of the container body and selectively opened by a bracket actuator attached to the trap door.

1459828527-b9f85940-272d-4aa7-bc0a-189c0ab9ca3b

A unique method for providing entertainment to a portable device, such as a wireless communication device, is disclosed. Aspects of the invention include novel STT-based switching devices, new configurations of known STT-based devices into useful logic circuits, common logic circuits and system building blocks based on these new devices and configurations, as well as methods for inexpensively mass-producing such devices and circuits. Particularly the invention concerns novel intermediates and their use in methods for the preparation of S-\u03b1-ethyl-2-oxo-1-pyrrolidine acetamide. After locking the locking device, a wellbore is drilled to have a diameter greater than an outside diameter of the tubular member. The destination position of the destination block of the reference model is not visible in the image.

1459828527-d6b2897b-e0f0-4df2-9643-2a3949f01ffa

A control system comprising a spark knock detection module that detects a spark knock in an engine of a hybrid vehicle, and a torque control module that selectively regulates an engine torque output and an electric machine torque output based on the spark knock. Furthermore, a support body for connecting the fixing base to the vehicle body frame is also separated from the engine by a gap. The rotatable imaging component is rotated. The dispenser is adapted to hold a roll of adhesive tape therein and because of the decreased distance between the projections, the tape assumes a convex shape when viewed from the front end of the dispenser. A double-sided display may be realized by the electronic paper display panel. The transmitter can operate in multiple encoding modes, each of which can provide a level of redundancy.

1459828527-ee300082-f333-4a33-a4bf-f4f6318d9100

A quick holder includes a bottom housing, a cover, two clamping members, and a tensile spring. The invention uses a lateral support to hold the weight of the instrument in multiple locations, a post or posts to stabilize the instrument in the proper position, and a mating receiver mounted to the instrument to allow for assembly of the complete support structure. A drying module is operatively mountable with respect to the support frame and defines a first chamber and a second drying chamber. The connection manager feature determines the most appropriate profile to connect to an available network. The second limiter element is connected between the signal line conductor and the common line conductor at another side of the transmission line.

1459828528-1de201b4-aa78-4236-8241-2b45d3b1b450

An assembly for restricting access to a coupler includes a body, a ball cavity engagement member; and a securing mechanism. One embodiment may comprise a plurality of processor cores. The contact assembly moves longitudinally toward the front end of the connector, such that the front end of the contact moves from a first position completely within the body to a second position proximate the connector interface, as the connector receives the coaxial cable.

1459828528-de1cd7e3-293a-4a12-a14b-8ea33d3c0949

A method of authenticating a user in dependence upon biometric input information is

disclosed. After this, an allocation resource amount for each module is automatically fluctuated in accordance with the transition of the predicted use resource amount. A reflector and heat sink are attached to the bottom of the post.

1459828528-ffffc716d-15fa-46f9-9ae4-c19dc9d2f683

Fully automated demand response may be implemented at end users, in accordance with terms agreed to by end users to reduce energy demand during demand response events. This first developer storage portion 116a is communicated with the second developer storage portion 116b via developer paths 122a and 122b, which are provided at both sides of the window portion 120. The regions of the N-HHLVTSCR and P-HHLVTSCR devices are formed during normal processing steps in a CMOS or BICMOS process.

1459828529-237aad5c-61b2-4a43-9e14-72613f6cddd0

A method of and system for handling latency issues encountered in producing real-time entertainment such as games of skill synchronized with live or taped televised events is described herein. A first of a plurality of network peers then executes a portion of the program instructions which initiates the execution of code hosted by said first network peer, where said portion comprising fewer than all program instructions. An encoded data stream is obtained from concatenating successive encoded blocks such that the encoded data stream includes a predetermined bit pattern comprising a plurality of bits. The phase information acquired from the timing reference signal may also be used for other purposes, such as aligning received data with a local clock domain, or transmitting data so that it arrives at a remote device in synchronism with a reference clock signal at the remote device. When a pulse is received, software in the micro measures engine parameters, calculates fuel parameters, and fires one or more injectors. Preferably brown coal coke is used as the adsorption agent.

1459828529-82f2bcfb-fb08-4c9f-a989-349bcc9fc17f

A pressure sensor pressure sensor and an in-fiber Bragg grating. More specifically, application features are mapped to corresponding sections of underlying code, and compiler directives are generated to direct a compiler to optimize the application for the performance of specific, application features, based on their popularity. A first end of each of second and third wires is connected to a respective one of the throttle valve and the brake unit.

1459828529-c3521f62-2621-4670-8922-f65a1ea4296b

Disclosed herein are techniques for the reduction speckle of a projection display system using novel lenslet integrators and related methods. The distal end of the outer sheath terminates at least one medical device length proximal of the medical device. The hydrophilic film-forming polymer is preferably GANTREZ S. 1 to 20 seconds at a time and that light from the lamp light source irradiates the object several times. The distal tip of the catheter is rendered radiopaque, at least at its distal-most end, to enable visualization of the position of the catheter and to facilitate placing the catheter in the desired position.

1459828530-736ba236-e7fe-4819-b5b3-d53cd72ba7ea

A system for a block storage client to work with data blocks in a virtual filesystem where the actual data for the data blocks is stored in a real filesystem. The conductive film has a predetermined distance to the organic resin film. In an embodiment, one document may contain information related to an overlay and the other may contain information related to a background. The disk portion defines at least one scribe line adapted to facilitate removal of the disk portion from the annular portion when a pulling force is applied to the handle. Also included is a multilayer thermoformable article comprising a web having a film of such alpha-olefinvinyl aromatic copolymers thereto. The first reinforcing layer has a braid pattern formed in a 4-over, 4-under pattern, and the second reinforcing layer has a braid pattern formed in a 3-over, 3-under pattern.

1459828530-a65e4c93-b6dc-4304-b893-6b0c2690b943

A method and apparatus for compensating for illumination of a reference block and a method and apparatus for encoding an image, using the illumination compensation method and apparatus, are provided. The support bar includes telescoping tubes with end retainers gripping walls of the enclosures. The orifice can either be initially closed or manufactured with a small opening or hole. A latch member extends proximally from the guard that is engageable by the plunger as the plunger is depressed to release the first set of cooperating detents.

1459828531-1ce847f9-5f66-470d-acda-1404217fbaec

A technique includes using a first signal that is produced by a counter to generate a center-aligned pulse width modulation signal having a first time profile and using the first signal to concurrently generate a pulse width modulation signal that has a second time profile that is different from the first time profile. The transferred information controls the communications relationship, including responses by the consumer computer, updating of information, and processes for future communications. At least one of the first member sides includes a first member slot having a first member slot axis.

1459828532-60440ff7-993b-466c-90b8-0fdd4020425e

The invention is a vehicular mirror assembly for a rectangular shaped mirror typically found on industrial trucks, earthmovers, and dump trucks. A system that incorporates teachings of the present disclosure may include, for example, a call processing system can have a controller for processing calls in a communication system. The tubing extension has a body portion configured to be tubular in structure and a thin walled section attached to one end of the body portion.

1459828532-e16cbb70-f1a9-47b9-b2e9-ecadfdfe512f

Shrinking the dimensions of PMOS or NMOS thin film transistors is limited by dopant diffusion. The metal coating covers all but those portions of the insulating housing that are adjacent to connective structures on one or more mounting sides of the insulating housing. The velocity of the vessel relative to the bottom is derived by fitting experimental data to a theoretical function. The controller device also registers the virtual switch such that the controller device is able to receive mapping information from the virtual switch.

1459828532-f64ddc72-64b8-4bee-9c3d-cce48ef8b7e2

An image-recording device comprises a recording processor that records a common still image on a plurality of recording media, respectively, which are detachably mounted on the image-recording device. The hinge further comprises a restricting member for acting between the support track and the vent arm wherein upon movement of the vent arm, the restricting member acts to further restrict movement of the vent arm. The disclosed compositions are useful, for example, in the diagnosis, prevention and/or treatment of diseases, particularly breast cancer. The arm inserts into a housing and/or an opening in a head. The invention also includes a process for making the dough composition using high shear mixing equipment. In various embodiments, one or more seed treatment apparatus components are in communication with one or more controllers such that seed samples treated by a seed treater may be treated at least in part based on one or more instruction sets that may be associated with one or more research plans.

1459828533-4af82e76-a901-44ea-aab8-3b30362e5537

Techniques for embedding metadata into a piece of content are described herein. The present invention also relates to a device comprising a shape memory alloy wire attached to a substrate, where the wire is mechanically attached into a 3D structure on the substrate. Each PE router in a service node exports flow records to a Flow Record Processor in the same location. The communication device includes a unique programming permission code for security purposes, such as restricting the user programming of the push buttons. A lower portion of the air

box is provided with first and second air suction ports. Actuation of the working and retract actuators is coordinated to provide at least three positions while enabling the actuators to be changed or modified independently from one another.

1459828533-524e7d5e-6dce-4324-ade5-196f921176d6

A Chrysanthemum plant named Artist Yellow characterized by its medium sized blooms with yellowed ray-florets and green disc florets. The marker comprises a chemical signature having at least one chemical, and indicates the source of the item. The groove is used to position the plurality of contactor blocks with a positioning frame. Unfortunately, conventional manufacturers of these capacitors have paid little or no attention to reducing the size of these capacitors through improved capacitor packaging. The mold includes a main mold body having a plurality of connected L-shaped plates projected radially outward from the central axis; a base plate which is joined to each L-shaped plate, and the top side of the L-shaped plates form a screw insertion part of the mold body such that the agitator fits between the L-shaped plates at a second end of the central axis. 5 to 10 parts by weight of a polymer having an anhydride group; 15 to 80 parts by weight of a non-aqueous organic solvent.

1459828533-6b919c18-491e-4cd0-b160-427e7b9c55cb

An implanted electrical signal generator delivers a novel exogenous electrical signal to a vagus nerve of a patient. A beam is optically coupled to an optical conduit, and the optical conduit is made to bend. The reading unit reads in an EXI grammar form. In this manner, pool water can circulate from the lower end of the second section, through the second and first sections and into the skimmer intake. Accordingly, the foreign bodies can be substantially removed from the surface of the substrate without corroding a metal.

1459828533-fa5fd6c0-17ee-40e4-9c58-281ed6fca749

A user interface for a receiver of a streaming music service simultaneously displays a current-song display, a past-song display and a future-song display. A circuit arrangement and its use are also described. The intake includes an elongated channel with openings on either end that provides a throughway for contaminants entering the channel. The MV location unit then accesses, for each of the neighboring video data units, the LUT to determine a location of a motion vector within a section of the video data to which the neighboring video data unit is associated. The images are compressed in real time for local storage or high-speed transmission for remote display.

1459828534-173c7954-6f93-4e59-b839-c25c6a210c02

A caddy apparatus designed to hold paint, construction items, supplies, tools and other materials while on an extension ladder without interfering with the safety of the person standing on the ladder is herein disclosed. The resources are identified based on their file extension and are categorized according to, e. A downhole transducer detects changes in fluid pressure at a downhole location and generates signals accordingly. The planter is characterized in that the support consists of two retaining arms which can be attached to two opposing sidewalls of the planter, whereby each retaining arm can be fixed with a lower area thereof to an inner wall of a sidewall.

1459828534-197c764c-1008-4230-b860-0feb48c9778c

A contact assembly and an LSI chip inspecting device using the same are disclosed. The file store includes a hierarchal file system. A smaller increment value can be used when programming memory cells to lower threshold voltage memory states and a larger increment value used when programming memory cells to higher threshold voltage memory states such as the highest memory state in an implementation. Use can be made of different inks or immobilisation step to obtain different layer characteristics. The size of the opening may also be adjustable. The plurality of metal posts is disposed into a metal post-storage.

1459828535-356620df-5f8c-437b-a1b4-5c960d192a78

A CPU cooling structure is constructed having a thermoelectric cooling panel installed in a heat sink and controlled by a control circuit to cool the CPU to which the heat sink is fastened. A filter cloth assembly can have a liquid permeable filtering medium attached to a connector ring. A second set of code instructions is emulated to generate a second set of emulated instructions that emulate a second component of the target system on the host system. The saddle to heat pipe interface is joined together employing a higher conductivity joining media, such as tin-lead solder, which improves the thermal performance of the heat pipe assembly and minimize the temperature drop across the interface. Other embodiments are disclosed.

1459828535-72654542-9453-47e6-a853-4c03666c0f66

A pressure sensor includes a pressure sensing element having a diaphragm, a cavity, and bridge circuitry connected to the diaphragm. The tagging camera device may further include database communication logic configured to receive from at least one database data representing information from an online social network. The probes may be directed toward different applications, that is, voltage probes or current probes, for example, and may include preamplifiers that adjust the range of input signals. A second conductive layer is formed over the insulation substrate. A first spring acts on the first lever arm and a second spring acts on the second lever arm. The measured values are used to calculate experimental results including temperature change, pressure change, percent conversion of starting material, and viscosity.

1459828535-cb6e365d-28fa-40ad-abab-7aefdf14359b

The disclosure generally relates to imaging optical systems that include a plurality of mirrors, which image an object field lying in an object plane in an image field lying in an image plane, where at least one of the mirrors has a through-hole for imaging light to pass through. The control system has a compressor fluidly connected to an inlet manifold of a power source. The relative spatial parameters include a relative area and a relative shape. The non-parallel orientation of the radially-facing surfaces avoids close contact between entire areas thereof when the in-slot portions move undesirably within the slot in the radial direction of the stator core.

1459828535-d73ef9f1-e1c2-43a0-b5ff-66bd618dc496

The closure device includes a first fastening strip, a second fastening strip, a slider adapted to be slidably disposed on the fastening strips. The system includes an input to receive a digital audio input signal and a splitter to split the digital audio input signal into a plurality of digital audio signals. Status and performance data can be reviewed in real time to allow a dispatcher to efficiently manage the truck fleet.

1459828536-a53eec8e-d401-41fa-9d57-c87d5fc6852a

The present invention is a stable labeling paint suitable for use on an OSB finishing line in conjunction with metal stencils. As each user adds and deletes files in the shared dataspace, the content management system can record each interaction. A mounting member is movably connected to the base and is movable to adjust the relative positions of the base and mounting member in order to dispose an orientation indicator, such as a level structure, fixedly secured to the base, into a predetermined aligned or reference orientation. The LED module has good heat dissipation properties, thereby improving its illumination performance.

1459828536-ff5a87ff-ccf9-480d-ae0c-6879a03d756a

The invention pertains to a human N-type calcium channel isoform, h\u003b11B-SFVG, which is involved in central nervous system signaling, and nucleic acids relating thereto. The method, computer program product and computer system can further

establish a communication using an alternate type of communication, if a difference is above the pre-determined threshold. A clock bus coupled to receive the clock signal enables the transfer of the clock signal to an adjacent data transceiver. The prefetcher also determines a predominant access direction based on the counts and determines a predominant access pattern based on the history. A suggested use of the fan cooling system is for the cooling of livestock in large livestock structures.

1459828537-1dfd6d77-d3ef-4e97-a3a5-1ade2e2c34a5

A technique that improves image analysis efficiency by reducing the number of computations needed to detect constant regions. Arrangements are also proposed for mounting the machines as wheels of a vehicle, to provide ease of removing and installing said motor. Emotionally charged words or symbols in each sentence are detected. By monitoring this proportion, it is possible to detect a frozen sensor that is characterized by a dramatic reduction in the variance due to process factors over a sufficiently long detection window.

1459828537-8e6fd526-578e-416f-b090-dbbc2c071558

Selecting a transport address for a call session between a first endpoint of a first region and a second endpoint of a second region includes determining that the call session is being initiated. An example of a decorative molded body can include a three-dimensional base pattern layer having, on a bottom surface of a transparent molded body, a transparent printing layer and a brilliant layer containing brilliant particles, in which the brilliant layer is raised brightly and three-dimensionally on the transparent printing layer as a background. The compositions of the invention include combinations of platelet derived growth factor, vascular endothelial growth factor, and angiopoietin-2.

1459828537-ab84775c-ca36-41b6-a6d7-8970e239d6c8

A method and system relating to color correction for the display terminal of a display device, such method includes a master control unit generating color adjusting ratios, a display driver using the color adjusting ratios to perform color calibration, and a display panel displaying the resulting colors. First, a memory including a charge storage structure is provided. The identification of the selected network node is achieved through binding of a session identifier associated with the end user to the selected network node.

1459828537-c73fda5e-08d0-4aa6-98e3-43a30eeb8d4a

A clip-style pulse sensor may be adapted to apply limited, even pressure to a patient's tissue. The process employs an isomerizationhydroalumination catalyst. The housing has a pump axis and defines a pump cavity. Based on the relevance levels, a priority is determined among the quality tests.

1459828537-dbf61974-e948-4cc7-8d18-008af369678f

A recordingreproducing apparatus comprises a program data reading-out device, a classification information storage device, a program data storage device and a controlling device. A clutch is provided with various settings for adjusting the torque at which the clutch interrupts power to a spindle. The mobile unit further includes circuitry for establishing a wireless bidirectional communications link with the central site server via a terrestrial network, which may be accessed via a cellular telephone network. An interlayer handover controller sets a handover preference indication such that the first controller biases handover decisions towards a remote station being supported by the first radio network and the second controller biases handover decisions towards the remote station being supported by the second radio network.

1459828538-07e597c5-e5d7-4412-9dc9-f3e52e78de65

A juice extractor includes first and second opposing cups relatively movable to compress a fruit therebetween, a strainer tube associated with the first cup, and

an orifice tube being movable within the strainer tube and having a pressure-applying end surface for urging juice through the strainer tube. The inventive adenovirus vectors carry one or more deletions in the IVa2, 100K, polymerase and/or preterminal protein sequences of the adenovirus genome. This enables the position of the oil discharge hole on the lower side to be as high as possible, thereby suppressing penetration of oil into the interior of the balancer housing through the oil discharge hole.

1459828538-51a649ce-bbf0-42c6-b818-8948cbf31821

Provided are a method, system, and computer program product for using information on InputOutput sizes of accesses to an extent to determine a type of storage device for the extent from a plurality of storage devices comprising at least one of a first storage type and a second storage type. The alignment load-lock includes an alignment stage that aligns a wafer during pump-down. The micro-actuator control signal is notch filtered to remove the frequency component of the sinusoidal signal before it stimulates the micro-actuator. The magnetic tunnel junction data cell includes the free magnetic layer separated from a second pinned magnetic layer by an oxide barrier layer. The logical port represents a logical E1 path between the two call control nodes. The safety element is made of a melting or subliming material.

1459828538-b959b3e5-0f2b-43b2-9fb2-66f806f8aa67

The present Invention provides a surfing device comprising at least one energy projecting means and at least one energy projecting structure for supporting and positioning the energy projecting means. The first and second auxiliary flumes are in fluid communication with the common main conduit and the underdrain laterals. These three members are attached to a shielding electrode S overlying the front substrate 111 to dispose the vibration absorber 241 between the holder 231 and getter shielding member 251.

1459828538-bcafd8b7-3fd5-4f5d-b296-101e5d93082b

A backside cannellure of an electrode to provide for detecting semiconductor wafer shift after the wafer has been positioned over the cannellure of the electrode is disclosed. The system identifies a resource having two or more data elements. A throttle pedal position sensor senses a position of the pedal, is connected to a control unit for sending a throttle pedal position signal to the control unit and is disposed forward of the CVT. Flexible timing is aligning the reference clock to the feedback clock is obtained with additional delay elements disposed in the feedback and reference clock paths.

1459828539-033f6d3f-ef65-4339-98c7-95826fdda69e

An object of the invention is to eliminate a program having a high general preference, and recommend a program customized to a preference of a specific user. The system includes a delivery conduit for administering fluid to the biological mass and a collection conduit having an external seal and for retrieving the fluid. Both the layout database may be GDSII files, OASIS files, or other format layout database file, in which multiple records sequentially build the layout database. A data storage controller is configured to encode each tuple in the mapping table using a variable length encoding.

1459828539-407c1952-3628-4696-8720-e979eb392093

A process and apparatus is presented for the improved selectivity of oxygenate conversion to olefins. The computer includes a display, a monitoring unit, and a browser. The content provider utilizes executable code, such as translation request code, for facilitating request routing utilizing popularity information.

1459828539-d3eeac06-a42a-4260-8bc0-cce7c43d8c67

A system for managing assets, and facilitating electronic commerce respecting the assets includes a computerized database for storing asset profiles for a plurality

of assets. The optical and electro-optic components of the camera module are hermetically sealed within a first housing. The status of each job is analyzed to associate a top-level category with each job and a status sub-category with each job. Each scattered sample includes two-dimensional information corresponding with the power detected at a specific coordinate.

1459828540-24e0ff75-e79d-433f-9005-05f9d2b8cd96

The present disclosure includes various method, device, system, and module embodiments for memory cycle voltage adjustment. The rechargeable battery pack may include a plurality of unit cells for forming a rechargeable battery by providing an electrode assembly to a pouch, a protection circuit module electrically connected to the unit cells, and a connector connected to the protection circuit module. The device then selectively powers down components in the device when the device has ceased communication for the first period of time. The driver includes first sourcing and sinking current limiters and second sourcing and sinking current limiters for limiting the currents in the first and second conductors.

1459828540-287933f6-6808-41c7-b075-a7a7d9cb1705

A drive system for driving large capacity motors includes a motor and a variable frequency drive which accepts input from a three-phase power source. The conversion circuit is able to troubleshoot the communication signals between the indoor unit and outdoor unit of an air-conditioner. Each C3 code contains a plurality of P codes and Q codes. A second confidence value is determined for the second recognition result. A first inverter stage is coupled to a common gate of the first transistor stack. The security arrangements prevent an unauthorized or suspicious USB device from communicating with the host system, detect suspicious activity originating from a device which is already communicating with the host system and may provide notification to a user.

1459828540-64b7578b-81af-4573-97d6-65a78fcac598

A controlled release pharmaceutical dosage form for bacteriophage is presented. A palm touch can be determined as the touch on the touch surface that has a radius exceeding a predetermined palm touch radius. An electronic component can be supported by the support. The frame is a molded frame of resin having lighter specific gravity than a specific gravity of steel. The system may also personalize item detail pages with information regarding any orders placed for the corresponding items and/or similar items. The new link is stored for future use by the user or by other users.

1459828540-724b9ca1-d711-47a6-a718-365011fa09b3

According to this invention, in order to efficiently output images, when an image and its attribute are selected, and an extraction output instruction of an image region with the selected attribute is issued, the selected image is segmented into image regions with different attributes, and an image region with the selected attribute is extracted and displayed from the segmented image regions. The recording medium stores information representing use or non-use of linear replacement defect management in which a defective area on the recording medium is replaced with the spare area, in order to record real time data. , providing service content to a terminal from a visited service provider. The disclosed details enable various refinements and modifications according to system design and tradeoff considerations. The differential amplifier, the hybrid load circuitry and the voltage regulator circuitry may each be disposed in the high-temperature environment of the turbine engine.

1459828541-98fa85e1-3d0e-4d2a-8e3f-be3a1abc3cc1

A method for cleaning residues from a semiconductor substrate during a nickel platinum silicidation process is disclosed, including a multi-step residue cleaning, including exposing the substrate to an aqua regia solution, followed by an exposure to a solution having hydrochloric acid and hydrogen peroxide. Doorbell

systems can comprise a temperature sensor coupled to the doorbell and a heating element coupled to the doorbell. Binding of the antibody to the nucleosomes is indicative that the individual has the disease condition.

1459828541-f408ee1e-0dfb-40ff-9683-2760d9099967

A memory includes first memory configured to store first data indicating relationships between logical addresses and respective physical addresses, wherein the physical addresses are arranged in a plurality of different groups, respective statuses of each of the plurality of different groups, and an activity log indicating when any of the respective statuses has changed. Indirect lighting is provided for illuminating the planter box with up-lighting and the supporting surface for the planter box with down-lighting. The one-dimensional linear batwing lens beam shapes light emitted by at least two light sources of the plurality of light sources. The gearing arrangement also includes a plate member positioned radially adjacent to the shaft. The inflation rate counter is reset at every garbage collection cycle.

1459828541-fb9286c4-5cc9-4a19-828d-b365bd7b1e56

A printing system includes a head, a carry unit, a memory, and a controller. A set of information bits corresponding to a message is encoded and interleaved to produce the mother code. In accordance with a preferred embodiment of the present invention, such a system extends relational databases with the ability to answer semantic queries that are represented in SPARQL, an emerging Semantic Web query language.

1459828542-2ae32fd8-ab6e-437a-8593-9577a258103b

A multisided card having at least two obverse faces and two reverse faces that are adjacent one another, can be used to print and store relatively insecure information of the obverse faces and to have more sensitive information stored and printed on the adjacent reverse faces. A control module chooses the at least one separate video layer stream based on the device parameter. Furthermore, reflectional angle of each mirror can be adjusted according to the requirement for design, so as to obtain the longest optical path.

1459828542-82d7e74f-24b4-4904-9395-78ceb0760d99

A rotary-type bag transfer device including a plurality of pairs of left and right grippers provided around an intermittently rotating table. A rule set is determined for a training set of data comprising a set of features having associated costs. An exterior couch may face opposite the interior couch and also utilize the lower mattress as a seat cushion. to the customer service representative and the user's personal contact list made available to the.

1459828542-a63f1940-ce96-4dfd-a949-368e6e8e79b9

Power management in a virtual machine environment that includes at least one virtual machine platform providing a plurality of virtual machines, and a plurality of separate computers, each connected to a respective one of the virtual machines in a typical virtual machine distribution environment. A first connector 2 is equipped with an energized slider 4. Event data may then be used to create or update image acquisition tasks and/or task priorities which are automatically provided to a scheduling system to facilitate timely and responsive acquisition of overhead images of the geographic location of the event.

1459828542-e0405f28-4741-4052-8695-2a28d1681cc3

Methods and apparatus are presented for performing coarse frequency tuning in a voltage controlled oscillator. In the management procedure, a reporting station receives a event request frame including one or more event request elements each of which comprises an event type field for specifying the event type of an event request and an event response limit field for specifying the number of requested event report elements. The conductive and dielectric layers of the ATF stack are

patterned into wire networks and bond pads. The method includes enclosing the ladle for example, with a lid and maintaining said refractory body in said ladle until substantially termination of the discharge of the molten metal from the vessel. The torque requested for a predetermined operative condition is obtained through a selection of the volume of the compression chamber combined with a selection of the time of opening and the time of closure of the inlet valves combined with a selection of the frequency with which power strokes are performed. A memory plane comprises programmable resistance memory material electrically coupled to respective second terminals of the field effect transistors, and conductive material on the programmable resistance memory material and coupled to a common voltage.

1459828543-4aa78493-09c9-43e2-b374-33a0e250badf

A transceiver system is described. The device is comprised of modules linked together to create a track upon which a mired vehicle drives over. The system may alert security personnel as to warrants or other information discovered pertaining to the recognized vehicle or individual resulting from a database search. Steel cables include ends mounted to the pulleys and lower ends mounted to lateral tabs of the lower grill grid.

1459828543-4cb22c8c-40d8-4f0f-a1d5-cded1605076b

A multipurpose site guard for use at all peripheral and central venipuncture infusion sites, sensitive areas, and for pediatric and adult patients. An embodiment comprises forming a dielectric layer on a substrate, wherein the layer comprises a pore generating material dispersed in an uncured matrix. A screen basket is positioned generally concentrically around the rotor.

1459828543-527eafe6-c3e5-4ed7-a11c-e3e6df39f3ad

A front connecting device of a concealed slide includes a metal base, an elastic fastener, a level adjusting member and a vertical adjusting member. The gear includes a rotating shaft having a hollow portion. A method of open loop fuel control is also provided.

1459828543-c620b672-171a-4ee8-b1ff-c5dbbd129778f

An application virtualization system enables server applications, such as web applications to be easily deployable, separates an application and its state from the system, and allows applications to be easily moved to another server. As a result, the concentration of the generated ozone gas is high and stable, and a high concentration can be maintained. When the advertisement is displayed, the correct updated information is retrieved from the EPG database and inserted into the advertisement.

1459828543-cc2c0743-dd72-4a27-a99b-5d5c6a9d9972

A virtual skeleton includes a plurality of joints and provides a machine readable representation of a human target observed with a three-dimensional depth camera. The window assembly includes a substrate being adjacent to a coating. The host system, after authenticating a user is configured to retrieve the user's account information from a user database system and translate a user account number into a temporary transaction number. The photo-electronic converting element receives the light emitted by the light source and which is reflected by the image surface of the original. The invention also relates to a method of self-alignment of a fiber pigtail and a method of attachment of a fiber pigtail to a surrogate chip.

1459828544-404ce478-0219-4c4a-9193-ed06fb8c418

Unique methods and apparatus are provided for rapidly identifying microscopic particles, such as protozoa and other microbes suspended in a fluid or gas. The device further includes a connection device electrically interconnecting the second and third contacts, and capable of being moved in translation together with the second contact; and a displacement mechanism connected to the connection device and

to the rod for displacing them so as to separate the second and fourth contacts from the first and third contacts, respectively. The sawing controller includes a handle.

1459828544-7e1b08db-569a-4311-b29a-e317db59216b

A testability analysis system analyzes testability by evaluating controllability and observability at the level of a hardware functional description independent of architecture. In a preferred aspect, cathepsin S is selectively inhibited in the presence of at least one other cathepsin isozyme. Thus, it is possible to subsequently adjust the cutout limit safely and easily via a key on a handset, so that the cutout limit may be adapted to the actual application into which the actuator system is to be incorporated. Finally, particles are removed by uniform water film flowing downward along the collection electrodes. In this way, the subscriber, rather than reacting to invasive information or identity theft, may proactively control access to such information, thereby preventing the theft in the first place.

1459828544-8c7a617a-3d70-4684-9a04-c1c157dac890

The present invention's nozzle is especially suitable for use in a shipboard air-discharge maneuverability device known as a \u201cbow thruster. The disclosure further provides a notification system for an Emergency Area ID. Alternatively, the hydrogels may be mechanically disrupted and used in implantable articles, such as breast implants. The lower buffer reservoir has a panel portion 1b which is bent upward to penetrate the cooling reservoir.

1459828544-c6c85a6a-f8b9-41ee-afd1-446aab4d21a3

The present invention relates to an interlabial pad which is attached between female labia, especially to the pad which can be used together with the sanitary napkin, which has a good sealing efficiency with the labia deepest portion when the user moves and can prevent the chance that the leak of the menstrual blood or the dropping off of the pad is occurred. A glass substrate with protective glass, which comprises a glass substrate and a protective glass plate laminated on each other, and which is characterized in that the glass substrate and the protective glass plate are laminated by a double-sided removal resin sheet. Each action can be performed multiple times before disposal. While the table is displayed, a user input that indicates the empty row and is configured to trigger the new row to be added to the table is received. The congestion control is effected by employing the enhanced signaling channels, which can carry audible signals, to determine whether to set up requested calls, based on a preselected congestion control process. In the inventive filling machine a recess is arranged in an upper surface of the volume such that the valve body is at least partly insertable in the recess in the rest position.

1459828545-0f52fa13-cc8c-410f-879c-48bc17d7cefc

A method for testing integrated circuit devices and loading such devices into a test board for further testing and an apparatus therefor is disclosed. In particular, front access for mounting a selected nozzle only requires adjustment of one lever and one fastener. The portion of the received video data with the first format may comprise RGB format, while the remaining portion of the received video data with the second format comprises YUV format.

1459828545-205aab67-f3cf-44e9-91de-dc84b68ac0d3

The invention relates to novel methods and compositions for the detection of analytes using the nuclear reorganization energy, \u03bb, of an electron transfer process. Thus, by bringing the front side of the contra-rotating front seal unit ) into a wet state by the lubricant oil, it is possible to reduce heat generation and it is possible to extend the life of the contra-rotating front seal unit. Receiving includes receiving, at the server, an incoming text-based message and an origin identifier indicating the message has been received by the proxy mobile phone via

the wireless telephonic network and forwarded by the proxy mobile phone to the server via the global communication network. The filter is configured to allow a greater flux of electrolyte than that associated with the junction member. Prior to transmission, a transmission power for each of the sub-carriers is adjusted based on the channel conditions. These approaches facilitate intelligent control of a processor's clock frequency and/or a fan's speed so as to provide thermal and/or power management for the computing device.

1459828545-4c6ca1b8-6c19-4acf-a171-ba0b86971118

An air belt device includes a first cover member and a second cover member connect to each other defining an interior surface having an interior cavity. The flash memory cell array includes a plurality of blocks. When a user enters a request to utilize the data, the individual fragments are stored upon receipt at the user's premises, and reassembled into a contiguous stream.

1459828545-b92158cd-0477-439c-b90e-fb071039d346

A cosmetic skin lightening product delivered from a dual-chamber package is provided wherein separate first and second compositions are filled into the respective compartments. The system and method provide a plurality of LEDs and corresponding specifications. At least one independent partial chamber is provided for the transport of the partial flow in addition to the main chambers. The frame is connected to the coupling structure and can vibrate in two degrees of freedom in orthogonal directions  $O_x$  and  $O_y$  in the plane of the wafer.

1459828545-d1163ea3-4ff7-4196-9674-dd5c935461f2

A structural electric tandem axle module for propelling a vehicle such as a large vocational vehicle without applying torque to the chassis frame of the vehicle as the module operates. The aggregate bins configured to hold an aggregate material. Filtration cassettes of the present invention can be manufactured from conventional membrane and flow screen components and can utilize both injection molding and vacuum assisted resin transfer molding fabrication processes. A digital flat-panel x-ray imager permits fluoroscopic x-ray device to be used in any orientation without being affected by distortions due to local magnetic fields. The fuel injector is positioned to inject fuel tangentially to the cylinder.

1459828546-1a3f4574-a0d7-4e2d-89ac-7b2c4e65a2ed

A combination of a bright and dark display pattern and a polarity pattern is used to drive a liquid crystal display device. The electro-magnetic switch is connected to each of interactive sockets to form a control circuit. The first end portion and the second end portion each include a side including an adhesive layer. In a preferred embodiment, the method includes cutting the substrate to form a sensor having a connector portion and a transcutaneous portion, the two portions having edges that define one continuous straight line.

1459828546-632af686-c778-433f-86e1-5c312a358485

A method for producing a substantially desulfurized a hydrocarbon fuel stream at temperatures less than 100°C. At a switch device, a packet is received from a server that is interfaced with a switch device and is configured to host a virtual machine that is a source of the packet. A magnetic linkage is therefore disposed between the cable and a pulling rope or cable and is adapted to break when a force appropriate to the particular installation scenario is applied. The gun ports can be configured as exchangeable cartridges or subassemblies that can readily replace regular non-expandable apertures otherwise used for defense against real ballistic weapons and explosives.

1459828546-93195909-932e-4b53-99dc-c58d4838d211

Flexible nanocrystalline cellulose films include a polymer while retaining the property of tunable color. An end user is enabled to select a video in the result page and activate streaming of a video summary within the context of the associated

result page. The supporting frame includes a plurality of differently positioned slots to position the handle so as to accommodate different sizes of shellfish. This permits the motor to be started always in the same rotation direction, and thus helps prevent reverse rotation of the motor. The adjustment circuit provides at the threshold adjusted output node an inverted signal corresponding to the high voltage input signal. A method of fabricating the convertible candle lamp is described.

1459828546-a008f9e2-b2ba-49ee-ac18-a6971e4ffaf7

A light source using electroluminescence layers of which width and thickness are adjusted so that emission luminance does not depend on the position on the layer. A second support having a second adhesive layer is fixed to the electronic component in order to interpose the electronic component between the first support and the second support. A supporting member is mounted on one side of the bearing member. The filling layer has a projection that extends outside the trench as far as the drain region and is electrically connected thereto. A probe carrying electrodes is introduced through this passageway and deploys, under the influence of its own resilience, to a structure incorporating a loop which is automatically aligned with the axis of the expandable ablation device, so that minimal manipulation is required to place the sensor probe. Since a DLC having low friction coefficient can be formed, the centerline average roughness can be reduced to 30 nm or even less.

1459828547-45913ec2-b00e-48ba-b79f-9cd204105629

A computerized system and method for inspecting and measuring a ball-shaped wire bond formed by an automated bonder pre-programmed to attach a connecting bond onto a bond pad of an integrated circuit by first obtaining a first image of said bond pad before bond attachment, then determining the coordinates of the center of said pad. The case is formed with an inner space in which a rolling member is provided in a freely movable manner by the pulling force of gravity. The book is gripped by a book holder proximate the spine of the book and the book holder is vertically positioned such the shear blade will shear the book in a predetermined position along this first edge of the book. Moreover, the method may include generating a business object template utilizing the business object shell, meta-data, and hooks for calling generic business logic, and modifying the hooks to insert the generic business logic.

1459828547-8981fffb2-d58a-4cdf-a156-9245883a3d14

The present invention relates to a liquid synfuel additive composition which is used as an additive to coal fines to enhance the complete combustion of the coal after turning it into a synthetic fuel. The casing assembly includes a first casing member and a second casing member. This new variety is having high production of long stems with a long vase life, vigorous, upright growth, and good tolerance to powdery mildew. Selected bores are counter-drilled at the RF signaling layer and filled with insulating plugs, which prevent shorting of the RF signal trace layer to ground, during solder reflow connection of leads of circuit components to the RF signaling layer.

1459828547-8b94c541-9fe1-4d0d-a53a-5d30530e3551

The present invention provides a diffusely-reflecting polarizer having a first polymer which is amorphous and having a birefringence of less than about 0. A dielectric mirror which is selective in wavelength is provided between organic EL elements, and the number of times especially blue light emission from an organic EL element is transmitted through an electrode having a light-transmitting property is reduced as much as possible, so that attenuation of light is suppressed. The row decoder includes latch circuits and a drive circuit. The composite material with the matrix material and inclusions allows the composite material to be acoustically dissipating with a stiffness in which the energy of forces associated with undersea platforms is resisted.

1459828547-9d2b792f-a086-4433-bfdf-43c704029a0c

A portable electric can crusher is disclosed that crushes cans, at the point of collection. The epitaxial layer includes at least four regions arranged vertically and defining respective interfaces, where each of the regions is characterized by a respective impurity concentration, where the impurity concentrations vary across each of the interfaces, and where each of the impurity concentrations exceeds  $1 \times 10^{17}$  cm<sup>-3</sup> for at least one single impurity in all of the regions. The back housing comprises a one or more side walls wherein a portion of at least one of the sides wall is operable as an extension of the fan scroll.

1459828547-aa3a6188-090e-4a56-b7f3-03ca74189383

A DCDC converter includes an inverter and a primary-side circuit with a transformer whose secondary-side voltage is rectified by at least one rectifier for generating an output DC voltage. The inner and outer jackets each including channels formed on an inner surface. One method calls for providing a feedstock powder including boron nitride agglomerates, and heat treating the feedstock powder to form a heat treated boron nitride agglomerated powder. The pawl defines a plurality of teeth facing the gear, and the pawl teeth define a second arc having a second radius larger than the first radius.

1459828548-4799146f-4d7c-4311-a61e-649483665dcd

Processes for preparation of a protein-polymer composite material are provided according to embodiments of the present invention which include providing an admixture of a polymer resin, a surfactant and a non-aqueous organic solvent. The electric charge counting fuel gauge can display an amount of fuel used in a power source and the amount of fuel remaining in a fuel supply. A stent can be proximally and co-axially slid over the distal end of the catheter shaft and constrained by a retractable sheath disposed co-axially about the compressed stent. This is accomplished in a reliable and low-cost approach that employs standard device fabrication techniques.

1459828548-588d0218-edca-4337-b66a-a15ec34a96de

A distortion compensation apparatus compensates for non-linear distortion of a power amplifier. A posterior probability indicating the reusability of each version of the existing software component is calculated for each specification of a device to be developed, on the basis of the likelihood and the prior probability. The silicon layer further comprises a first well of a first type and a second well of a second type. The ion deflecting device may include a pair of curved, parallel ion deflecting electrodes, which are in addition to curved electrodes utilized for applying an RF ion guiding field. Moreover, a marked unit is disposed where said inner tube and outer tube are joined, thereby allowing the invention to have a structurally simple handle that can be aligned effectively, which in turn allows users to grasp the precision in the movement between said inner tube and outer tube.

1459828548-95c6842c-ed52-44f4-b879-f643139d51b3

A radiometric calibration system finds an inverse response function of a camera from a single digital image of a scene in which the actual colors of the scene are not known a priori. The corrected intensity values enable more accurate isotopic analysis to be conducted and render such techniques applicable to low level emission cases. The fine pattern has a critical dimension that overcomes the resolution limit of an exposure equipment. The data flow characteristic may then be transmitted to a network element along the data path between the routing gateway and the service provider equipment. The second communication apparatus demodulates composite waves of desired waves and unnecessary waves received by the reception antennas by envelope detection or square-law detection and carries out correction operation for the demodulation signals based on transmission characteristics of transmission spaces between the transmission and reception antennas to acquire

transmission subject signals.

1459828549-325bf9ce-bd77-4cb6-aaa1-832a0370c1ef

A work machine for removing asphalt from a roadway is disclosed. The retaining elements provide the actuator with a desired pretension. The frame has legs that extend from a position, which is located opposite to the device to be mounted, toward an installation surface of the body casing. If it is in the UART format, the select circuit outputs a message to the UART circuit.

1459828549-5a4bd4ab-b42f-4eaa-8716-6a766ac1ef17

The present invention provides methods of monitoring the injection of a fluid into a subterranean formation. Additionally, the first key portion of the split encryption key is retained by the server, while the second key portion of the split encryption key is delivered to a sending client and is discarded from the server. Also, since the contact temperature can be lowered, simplification of apparatus and energy saving may be attained. The invention enables automatic detection and selection of an optimal network storage virtualization protocol on a per resource basis, which is a unique capability and something that has not been accomplished in the prior art. Such a filter overcomes the insertion loss and power handling limitations of conventional band pass configurations and as such can be used in power amplifier and duplexer applications.

1459828549-ad524d8b-5c3a-4019-a2c3-c85ade86fff5

An optical device including a whispering gallery mode optical resonator configured to support one or more whispering gallery modes; and a photodetector optically coupled to an exterior surface of the optical resonator to receive evanescent light from the optical resonator to detect light inside the optical resonator. The front chaffer has a closed upstream portion and an open downstream portion. Each probe tank is labeled with the bar-code. When the mobile station comes within range of a cordless cellular base station, it deregisters automatically from the cellular network and register with the cordless cellular base station.

1459828549-f7cdeade-9a8b-4b70-a153-fd7b81b0b15e

A range-conversion method and system includes receiving data records. The assemblies are adapted to create compound curves such that respective portions of the distal region have distinct curvatures. The honeycomb cells of the pad are aligned perpendicular to the horse's back and flex with movement to reduce shear forces against the horse's skin.

1459828550-7deb1305-a41d-4719-9c7f-b7c02a6ef38c

A localized and distributive optical switching control system is separated into three localized systems: a sensor system, a processor system, and a position driver system. The lure consists of a body made of flexible material with two tails of a general semi-circular or sickle shape, integrally molded to the body and made of the same material. The invention also relates to the device for implementing the process and to its applications. The recombinant protein is also purified from the recombinant host cells. As the acknowledgment packet is sent by the router, and not the destination packet is sent by the router, and not the destination host, this system allows acknowledgment packets to be received on a shorter timescale, reducing the effects of a link delay.

1459828550-c0743490-cddb-4235-ad0d-2f78cfbf7929

A reception device receives and demodulates, for each subchannel, data transmitted independently via three subchannels, which are a subchannel of interest and the two upper and lower adjacent subchannels which interfere with the subchannel of interest. The assembly includes a support arm body securable at an end to the frame. The end face of the support pin includes a pole of the cavity and has a peripheral edge which intersects a parallel of latitude at 10 degrees from the pole. A gateway processor processes the financial transaction authorization

requests and couples to a financial network interface configured to couple to at least one financial network.

1459828550-ee0f6613-7d71-452f-a051-cded32e29ca6

A method for resizing an image is disclosed. Under very high temperatures the material is designed to undergo pyrolysis and transform into a strong ceramic material. For example, good or poor behaviors could include: condescending, whining, nagging, weak, strong, refined, kind, dull, energetic, interesting, boring, engaging, manipulative, likeable, not likeable, sincere, artificial, soothing, abrasive, pleasing, aggravating, inspiring, unexciting, opaque, clear, etc. The second magnetic core member is generally planar for joining with the first, second, and third surfaces of the first magnetic core member. The sensory modifiers comprise polysaccharide carbohydrate having at least about 75% by weight amylopectin and the polysaccharide carbohydrate has been treated and swollen with a substantially anhydrous solvent.

1459828551-5da52f4b-96d6-41af-bab8-35677346e5f9

A lamp house storing a plurality of flash lamps and a chamber storing and holding a semiconductor wafer are fitted to each other in an openable/closable manner. The interface can include multiplexers coupled to the data alignment modules, wherein a data alignment module has outputs coupled to a first multiplexer. The dimple-like recesses are provided in a first region including a tire maximum width position of the sidewall surface of the tire. This invention is also a process that that sulfonates phenyl-alkanes having lightly branched aliphatic alkyl groups that to produce modified alkylbenzene sulfonates. A bit receiving housing is at the other end of the holder having a bit receiving channel to engage the drill bits. The user may instruct the diagram generation manager to add or remove detail from the interaction diagram by adjusting breakpoint attributes and/or adding/deleting breakpoints.

1459828551-6c21945f-478a-404c-9276-3529b9dc972b

A read retry of an MSR medium is executed while changing a setting of a reproducing magnetic field. These devices may have particular utility in providing support to the urethra. Fuel rod aggregates are housed inside the square pipes and in a cells formed between the square pipes. The second data is enqueued for output, and output as an output document at the highest output speed of the print controller. A higher current generated indicates less conductive material at the scan target that may mean a void, dishing, or erosion is present.

1459828551-83468f25-6cd5-48b9-9686-759242abf737

A video apparatus consistent with certain embodiments has a receiver that receives a data stream containing video data and video overlay data, wherein the video data includes a censored region having boundaries. A remote representation of a property value is compared to a local representation associated with the same property value. If the comparison indicates that a difference between the target digital value and the current digital value is greater than an allowable threshold, a trim setting used to trim the internally generated voltage is adjusted based on the difference. The module includes a switch mechanism having a spring biasing member arranged to bias the switch mechanism to an open position.

1459828551-f56c8cfd-da58-4698-8a69-b67fa5ef4f4f

A method for forming a strained layer of semiconductor material, e. An input section collects various sounds generated at the target place. Additionally, the image recording device includes a sheet feeder disposed between the recording unit and the tray.

1459828552-0cf4a0ae-3e7f-4e9d-aae2-6a7fc6c87843

Allocate power so as to maximise the throughput of each user of a multi-user MIMO group, with the constraint that over time all users in the group have equal

throughput. The main feature of the invention is that the reinforcing plies of the hose, which are partially or entirely bonded with rubber, are embedded in the adhesive resin layer in the coupling device assembled to the vulcanized hose. Such a reflex tube can also include one or more connections.

1459828552-7f238599-a205-486d-b221-be638021d093

A single chip multiple range pressure transducer device including a wafer having a plurality of simultaneously formed thinned regions. Subsequently a sawing operation divides the lead lands into multiple leads, and the leadframe and resin material are partitioned to form packages. Then, a dividing operation is performed on the frequency-domain initial target impulse response and the modified CIR to determine an initial value of the frequency-domain TEQ impulse response. The body portions are flat so that a direction of extension of the flat shape is along a rotational axis direction, and the magnetic member has a U shape as viewed from the rotational axis direction.

1459828552-92202ecc-d648-4440-9035-5ad855d972bc

A gateway exchange node according to a first embodiment of the present invention is disclosed. An embodiment of the detent mechanism includes a detent member having radially directed slots, and a detent pin movable in a generally radial direction relative to the slots. A cleaning member extends into the cob cleaner aperture and is adapted to engage the ear of corn inserted into the cob cleaner aperture.

1459828552-9e66ad1f-e4de-46c5-b324-06422c42dfa7

The control device is a device which can be connected to an external device that transmits data, comprising a computer program which analyzes data received from the abovementioned external device using data format information related to the format of the data, wherein the abovementioned data format information is stored in a separate location from said computer program. The actinic energy ray-curable resin mentioned above can be produced by causing the reaction of a polyfunctional oxetane compound with an unsaturated monocarboxylic acid and the subsequent reaction of a polybasic acid anhydride with a primary hydroxyl group of the resultant modified oxetane resin. If the next cache access is taken from the same cache way as the previous cache access, the control circuit signals all the cache ways, except the cache way that was previously accessed, to not access information from their arrays. An environmental change in an environment within or adjacent to the client system is detected, resulting in executing a procedure for deciding whether to switch from playing the first media stream to playing a second media stream differing from the first media stream. The gasket also includes at least one self-locating arm in a sealing contact within the recess and extending from one of the first or second sides of the anchor portion of the first section.

1459828552-cc83402c-1a3e-45bd-a364-acdf4df55088

A pipe joint unit includes a first pipe member with a male joint, a second pipe member with a female joint, and a pipe joint member coupling the first pipe member and the second pipe member. The acquisition technique facilitates receipt of the state vector components in any chronological order. Then, an amorphous silicon layer is formed on the metal layer by a physical vapor deposition process. When the switching device is turned off, a discharging current outputted from the power supply unit supplies power to the lighting unit.

1459828553-7142051e-3a24-45b0-9944-9fe3bae16f2e

During a period after starting exposure to a plurality of shot areas subject to exposure on a wafer until completing the exposure, a light via a slit pair arranged on a stage that holds the wafer, of illumination light via a pattern generating device, is received, and information on a positional relation between an illumination light and the stage is detected. The system operates from a network-connected computer node running a software application. The first N-channel MISFET has a source connected to the first input, a gate receiving a power supply

potential, and a drain connected to the first output.

1459828553-9e972119-f4c1-4395-a9ee-a1756d08b080

A compensating element for supporting a fuel injector in a cylinder head of an internal combustion engine has an annular design and is situated between a valve housing of the fuel injector and a wall of a receiving bore of the cylinder head. The cross-section is perpendicular to the longitudinal axis of the fuselage. A formulation, for treatment of a bacterial infection, comprises bacteriophage, liquid carrier and adhesive, which dries so that the adhesive adheres the bacteriophage to a surface, one such formulation comprising liquid carrier: 85%-99. The objective lens is a refractive index distributed lens in which a refractive index is high in a vicinity of an optical axis and reduces as a distance from the optical axis increases. Therefore, the voltage between any two terminals of any of the transistors in the IO buffer does not exceed the normal supply voltage so that the IO buffer of the invention can transmit and receive signals with a voltage swing twice as high as the normal power supply voltage using normal supply voltage devices and without gate-oxide reliability problems.

1459828553-b4ca1b98-f61b-47a5-9c35-4c8c81ba623a

Given a set of two images with visual dynamic range, wherein the second image is an approximation of the first image, a standard dynamic range equivalent peak value is computed, wherein the EPV is smaller than the maximum pixel value of the first VDR image. Tiles of image data are borrowed from the proximity of the destination region or some other source to generate new image data to fill in the region. The probes may be directed toward different applications, that is, voltage probes or current probes, for example, and may include preamplifiers that adjust the range of input signals. The treated amine includes an aliphatic or aromatic amine containing at least one primary or secondary amino group reacted with an aliphatic or aromatic nitrile and hydrogen.

1459828553-bb7afd54-1fc3-4104-978b-3c5b0fddee33

A mounting device for a heat sink includes a basis and a pair of operating bodies. The partitioning plate includes a partitioning body having a plurality of through-holes and a control plate disposed on the plasma generating space side of the partitioning body and having radical passage holes in the positions corresponding to the plurality of through-holes on the partitioning plate. The under-bump-metallurgy layer comprises an adhesion layer, a barrier layer and a wettable layer. The compressible seal member is molded around a portion of the frame construction. Measurements are communicated to a central measurement controller, for example located at the headend, which collects measurements from a plurality of cable modems and the upstream measurement system. In another embodiment the support is hinged in the middle and folds together like a bi-fold door to open.

1459828554-38f1fb43-9c35-48b8-8d90-877710d252b6

The present disclosure uses a nano-SiO<sub>2</sub> powder as a supporter with H<sub>2</sub>PtCl<sub>6</sub> added as an electro-catalyst precursor. The memory device driving circuit may include a main driver connected to the memory device, to drive the memory device, and a secondary driver connected between the memory device and the main driver, to control a set resistance of the memory device. According to the above apparatus, it is possible to keep the light of a screen uniform.

1459828554-663a1928-d62b-4861-986b-f5fb926a08fc

Methods, systems, and apparatus, including computer programs encoded on a computer storage medium, for object detection are disclosed. A second support member of one example is at least partially received over the first support member. A main valve body opens and closes the passage in accordance with the electromagnetic force generated by the electromagnetic actuator. According to one aspect of the invention, the data is transferred from the external device to the volatile system memory and then from the volatile system memory to the Flash memory, allowing

additional verification steps to help insure that the data is transferred intact. The dewaxing catalysts include a zeolite with a low silica to alumina ratio combined with a low surface binder, or alternatively the formulated catalyst has a high ratio of zeolite surface area to external surface area. The level converter circuit outputs a third voltage higher than the second voltage when the input terminal is supplied with the first voltage, and the level converter circuit outputs the second voltage when the input terminal is supplied with the second voltage.

1459828554-98ffd867-77d4-4871-8e8a-a1ff447a76fb

Position dependent operation of a materials handling vehicle, comprises utilizing a processor on the materials handling vehicle to communicate across a wireless computing environment to a corresponding server computer via a transceiver on the materials handling vehicle. Hence, hydrogen is attracted from the oxide semiconductor and trapped in a region of an insulating film which overlaps with a source region and a drain region of the oxide semiconductor. Before the signals are transmitted an analysis is made to choose which one of a set of predetermined polarity reversal combinations is advantageous to encode the data bits. The device profiler traverses a vulnerability tree having nodes representative of characteristics of the hosts, each node having an associated set of potential vulnerabilities. The controller is further configured to scale the frequency of the bus interconnect clock signal if the bandwidth of the master port and/or the slave port meets respective bandwidth condition, and/or if the latency of the master port meets a respective latency condition for the master port. Finally, for each pixel within the selected subset, if the least significant bits are greater than the corresponding value in the lookup table, then the most significant bits are incremented.

1459828554-a2c04590-89da-401c-8fd8-873c2f43295e

Method, apparatus, and computer program product embodiments are disclosed for independent wireless resource sharing on a fair basis to enable selecting the most suitable coexistence between wireless networks. The electrical motor drive comprises a rotor with a permanent magnet, a stator with a magnetic circuit and one or more coils, and a position sensor comprising at least one magnetic field detector positioned in the proximity of the rotor permanent magnet and configured to detect both rotational and axial movement of the rotor. Systems and techniques may include generating a session key, encrypting data using the session key, and encrypting the session key using the public keys of at least two users. The logic element enables to configure a plurality of hardware modules, which can perform processings equivalent to those performed by the plurality of software module, using a dynamic reconfiguration.

1459828555-0ccbc0e5-2bc7-4cd3-85d2-c094d8142ecb

To make the shape of parts simple, the transmission changeover well timed and reliable, and the size reduce, a transmission changeover mechanism in a disc apparatus includes a rotary control piece which is spring-biased to rotate in one direction, and has a transmission switching gear wheel fixed thereto. The feed can consist of silicon wafers arranged in quartz boats. The method includes executing the command if it is determined that the command refers to a current screen section being rendered. The applied reference signal includes a voltage value and position information. The distance between the optical switching element and the scanning signal light emitting element is less than the pixel pitch at which the plurality of pixels are arranged. Compositions including a quaternary ammonium heparin complex, a moisture curable polysiloxane, and an organic solvent are also disclosed, along with methods of making and using such compositions.

1459828555-561b2b04-c576-4560-b41a-b304fa12e6c6

An optical disk drive for optimizing laser power to be used at the time of recording operation. The front and rear edges are aligned, after having determined

the angular geometry of the ply edges by means of a suitable device, by independently moving at least one gripping sector of each of the front and rear areas. Front wheels 39 are supported on shafts attached to the opposite side surfaces of a front part of the step 33 and connected to the step chains 32, respectively. This enhanced microbial population may rapidly absorb and mineralize materials in the wastestream. The arrangement also includes an immersion media filling the volume of area between the exterior housing and the lens assembly housing. This is accomplished by providing a composite image format comprising an NM array of overlapping images, and allowing the user to sequentially capture the images in the array.

1459828556-43f8f00c-bf1c-4c7c-a606-92acb94d627d

An approach is provided for conducting transactions via an audio token base payment system. Accordingly, each device is configurable to support both the registrar as well as enrollee modes of operations. The blade has two elongated extensions running away from the handle. Within the lubricant tank, there are also pressing bodies. Accordingly, the breakdown voltage characteristic of the gate oxide film is improved.

1459828556-e5b1401a-2227-457d-9b13-0d0e45f2e660

A method of recording holographic information includes recording a hologram mark and a homogeneous mark in a holographic data storage medium with a volume to alternatively locate the hologram mark and the homogeneous mark. In one exemplary embodiment, the cosmetic and wound-healing formulation comprises live yeast cell extract, pigment, and a gel. A strain relief member is provide to increase the strength of the electrical transmission lines to enable them to withstand the tensile forces caused by either flushing and/or pull-back operations. The neighboring cell uses a different communication means than the first network element. Based upon this beta angle error curve, the processor generates an appropriate error correction signal for guiding an object based upon the relative direction of the received radiation. The control circuit includes a velocity sensor for coupling with the motor for providing a velocity feedback signal responsive to the velocity of the motor, and circuitry for providing a feedback signal responsive to a voltage associated with the motor, such as the back emf of a coil associated with the motor.

1459828556-eef700f1-c854-4ba7-8791-e3dc0fd2e34d

The claims encompass hard surface cleaner and hard surface treatment compositions containing particular ampholytic polymers which impart not only good residual cleaning properties but in particular give fast drying properties to the cleaning compositions. Therefore, when the temperature and pressure rise with a first combustion started by spark-ignition around a spark plug to the fuel injected from a second injector into the combustion chamber, the timing of starting a second compressive hypergolic ignition is optimized to provide a stable combustion state free of knocking and misfire. The new variety is a Salvia, normally produced as an outdoor garden or container plant. Observations of a GNSS signal from each of a plurality of GNSS satellites are obtained.

1459828557-078c6b8e-a3d2-44d5-a1e9-c9eb00412458

An adapter for switching liquid patch device and air pump includes a body which has an air intake path, an air outgoing path, a liquid outgoing path and a tire connection path. The optical member includes a lenticular lens member having a plurality of convex lenses and a light-reflecting layer disposed on the back surface of the lenticular lens member. Each feeder link and mobile link beam comprises a plurality of feeder subbands and mobile subbands grouped to form feeder link channels and mobile link channels. Each of the plurality of power supplies are coupled to one of the plurality of sources. Various passages or channels can be provided to facilitate communication between the bypass valve and the water supply lines. The second width is greater than the first width.

1459828557-3d35a086-c50f-4579-98a4-eb84dc298bf2

A method of computing global-to-local metrics for recognition. The rectifying element has a second conductivity type layer, a first high concentration second conductivity type region, a second high concentration second conductivity type region, an element isolation film, a first insulation layer, and a first conductive film. The resistance of the calibration transistor-resistor array is determined according to a digital code generated from the digital code generator.

1459828557-833ab0cc-9926-4837-a256-89d4beabb160

Chewable sustained release compositions and their methods of production are provided. The UIM 20 stores UIM identification information. The second guide track has a plurality of detents for receiving the guidance device so that the lever may take different positions, each of which controls a particular forward engine speed. The adaptor is worn by a jogger through the use of a waist belt.

1459828557-9b7ff20e-af81-4290-91c1-0b23514c06ed

Compositions and methods of making compositions containing nopal cactus isolates derived from the juice and/or soluble solid fractions of nopal pads. A CMOS process with an epitaxial layer as bulk and p-type substrate is used to implement the circuit in this example. The pivot axis is here arranged running obliquely to the optical axis. The magnetic circuit and the frame are assembled in such a state.

1459828557-a81a2fab-12e4-4487-aa96-2e6b56dddd27

A system and method for routing audio for a vehicle mounted communication system includes activating a PTT button associated with a handheld or rear microphone and determining whether a short range wireless device is operationally coupled with the vehicle mounted communication device. The controller further includes an oscillator for generating the clock signal responsive to an oscillator control signal. Surfaces, disposed in the internal and circumferential grooves, orient the biasing element in order to effect sealing between the housing and the sleeve and an axial force to provide latching or locking between the seal and the piston. The material engages the simulated human tissue and moves relative to the scaffold to measure the coefficient of friction between the material and the simulated human tissue with the load cell. The system can be implemented in CMOSBiCMOS technology and is suited for low power applications.

1459828557-e97cf7bb-1b06-4d96-a94a-bfb94cab670f

A assembly for nasal irrigation for the handheld irrigation of a user's nasal cavity comprising a housing with a refill chamber containing irrigating fluid, an applicator, an actuator for forcing irrigating fluid from the refill chamber through the applicator into the user's nasal cavity during operation, and a solution port for refilling the refill chamber. The coplanar transmission structures are formed on respective first and second electrical elements that are secured on respective independently positioned and mechanically joined carrier and housing. Distances from the stereo image capture device to points in a captured image are stored in a stereo distance map and distances from the moving image capture device are determined from pairs of images captured by the moving image capture device and stored in a moving distance map. A temperature sensor may be positioned near the conductive button as a feedback mechanism to a control circuit. The ceramic substrate is formed by injection molding a ceramic material and binder to form a green substrate and subsequently sintering the green substrate to form the substrate. The optical disk apparatus includes a reading unit for reading the code block from the optical disk and an error correcting unit for combining first error correcting processing performed on the code block read by the reading unit with second error correcting processing performed by adding remove information to codes that cannot be corrected during at least the first error correcting processing.

1459828558-078f6626-eb77-44bd-bcdf-1a603b70fc20

Methods and apparatus for managing cash items are disclosed. Taking a port-A clock signal as the reference, the control circuit generates a select signal that selects a port A during the period from elapse of a first predetermined time from the reference timing until a second predetermined time has elapsed and selects a port B during other periods. A shank assembly is slidably disposed through the body. A comparator determines whether the relevant data has been changed by comparing it to an archived copy of the relevant data.

1459828558-4146c8be-87e7-4c10-90e4-d1f31f6593d6

A system for determining depth, height and other reference information with respect to features on a workpiece is disclosed. Deformable arms on the male component extend back from the lead edge of the body portion of the male component which is inserted into the female. Items may also be recommended to the users based on their collective preferences. If the number has been ported the switch processes the call in accordance with information linked to the number in the database so that stranded numbers can be assigned to stations without regard to the rate area in which the stations are located. Finally, a stripping process is performed to remove the patterned photoresist layer.

1459828558-82055df2-29a8-43e9-aca1-843d28a8d7fd

Disclosed is an electric power steering apparatus having an electronic control device for controlling motor current based on electric signals inputted from a torque sensor of an automobile and a motor for generating steering power. Sections are formed next, each comprising at least one scale factor band. Query completions are obtained for the query prefix. When the over-temperature condition occurs, a signal activates the PROCHOT#, or similar, pin on a microprocessor, throttling the microprocessor clock.

1459828559-392d6ad6-40c7-4341-818e-3319e6a984d7

In a sea cucumber cultivator, sea cucumber cultivation baskets are arranged in multiple layers within a housing to protect the sea cucumbers from the external environment, to enable mass production and easy management of sea cucumbers. A second set of rollers is mounted along axes which are arranged 90 degrees relative to the first set of rollers and underneath the drawer. A bracket is slidably mounted to the movable rail and is movable along a sliding direction between a retracted position and an extended position. The second gate layer extends over the drain of the transistor above the dielectric and gate oxide layers to form the gate extension.

1459828559-660824b2-f637-43ef-8024-7475e20e93ff

An arrangement of a flex circuit relay 7 is provided. The housing having an inner chamber for receiving the joint ball of a ball pin and an opening through which the ball pin extends, and a contact area on the outer surface area of the housing forms a seal with a bellows. Each arcuate element has a latching portion protruding therefrom.

1459828559-fea777b0-94e7-4047-b96d-514f4c294f84

A composition and methods of its use, the composition comprising: a halogen source, urea, and an additional halogen stabilizer excluding urea, optionally an alkali in a concentration sufficient to provide said composition with a pH of greater than 10; and optionally excluding a stabilized bromine compound from said composition is disclosed. The supply shaft supporting members support a supply shaft, and the take-up shaft supporting members support a take-up shaft. By frequently powering up and powering down the processor during a period of time, the power consumption of the processor may be controlled while providing the perception that the processor is continuously available. Each of the fluid lines has a flow control valve between the pressure source and each lifting member. The interconnect bonding sites are located on the leadframe relative to the bus bars such that shorting to the bus

bars by wire interconnects is eliminated.

1459828560-55ed3053-5b1b-4dbe-816e-14a5422c3d5f

A CADGIS system that automatically discovers hierarchical relationships between root facesparcels, smaller facesparcels, and other defined areas of land. When so positioned intra-orally, the device exerts pressure on an area of nasal vascularization of the human. Accordingly, one cell may be readily replaced by another, even late in the design process, without disturbing the placement of surrounding circuitry. The first end includes an outwardly extending flange, which is engageable with the first support to orient the body and the fan housing relative to the lower surface of the first support and to maintain a predetermined distance between the lower surface of the support and a lower surface of one of the fan housing and the hanger body.

1459828560-895f9fe3-0859-4ff6-bafa-44b76b5bed8a

Heteroaryl piperidine and -piperazine derivatives of the formula in which the symbols are each as defined in the description, and agrochemically active salts thereof, and use thereof for controlling phytopathogenic harmful fungi, and also processes for preparing compounds of the formula. The tactile pads are positioned or adapted to be positioned on the steering wheel or proximate to it, such that they can be touched by at least one hand of the vehicle driver while driving the vehicle. The chamber may have at least a chamber valve to establish or block the flow of the gaseous working fluid between the heating chamber and cylinder space. The expression is decomposed into sub-queries to prevent double counting of data in ambiguously defined situations.

1459828561-38ccfba8-3b83-480d-84ea-2db08a4e46c9

An animal toy includes a housing comprising a hollow air filled compartment and an outer wall substantially completely circumscribing the hollow compartment. The amplified downward signal is output to the terminal device side via the second filter, the first filter, and an output terminal. Because of the pressure from a writing implement at time of entering, the signature is copied to a sheet for verification. The shared document can be released from the exclusive state in response to an instruction of the user checking-out the shared document.

1459828561-572c4386-50c5-4dbc-a07b-8a18d297f2ae

A selective one-way wrench includes an annular head defining a first space, a second space communicated with the first space and an aperture communicated with the second space. Before a pivot cartridge is assembled into a disc drive, impedance readings of the pivot cartridge are taken, preferably, at more than one rotational position and across a frequency range. A lower portion of the adaptor mates with the upper portion in telescoping fashion to provide adjustability. A software update is initialized if the output states differ. Even if the input image includes a fold-over component on the high-frequency side or does not include an adequate high-frequency component, an enhanced image can be obtained without enhancing noise. When an impact force of landing is loaded to the bending deformation member 30, the lower plate portion 31 and/or the upper plate portion 32 displaces or deflects in such a manner as to rotate about the curved portion 33 with the compression deformation member 35 being compressed.

1459828562-87d8c188-3f96-4957-8b97-d74833d04ad7

Thermoplastic film, microporous film, and laminates thereof, are made at high speeds on the order of about 500 fpm to about 1200 fpm. The uploaded content may comprise an image file containing a photo of the first member and a caption associated with the photo image. The method is capable of providing more than 90% accuracy, and prevents needless dispatching of installation crews to a customer premise that is outside the effective RF coverage of the system.

1459828562-bff8da3f-0376-4b5b-8b45-a4cfa6006766

A pin for use in connecting graphite electrodes into a joint, where the pin has at least one male tang having a tang factor, defined as the ratio of male tang length to diameter of the electrode into which it is to be threaded, of at least about 0. The method includes generating symbolic expressions that are associated with scan cells within the scan chains. Upon identification, a portion of the sheath is steered to position at least one treatment needle at the determined location.

1459828563-0be24717-3229-4d9d-a740-5639f0204211

A digital protection and control device for a power distribution network, which comprises a computerized control unit comprising a microprocessor. The system is configured with a mapping of relevant vehicle identification assistance data or vehicle specific information to one or more selection locations in the user interface of a vehicle service software application. This is achieved by two method steps in that, in a first step before the reshaping of an end piece of a hub, a die is axially arranged on the rolling bearing in a preassembled state and, in a second step during the reshaping of the end piece and the shaping of the end-side toothing arrangement, the die radially delimits a radial recess of the rolling rivet collar as it forms. The integrins used in the present invention are integrin  $\alpha_v\beta_3$  and integrin  $\alpha_1\beta_3$ , and new antagonistic peptides screened from peptide library have high binding affinity. Yet another embodiment is a sensing method that exposes a trap that is adjacent to an optical resonator to an environment that may contain a contaminant that the trap can capture.

1459828563-a0567de9-6334-46aa-b929-bb2b80d120e4

A swim cap includes a first portion configured to cover at least a portion of a crown of a user's head and having a first durometer. The bracket can also include at least one vibration dampener. These statistical features are measured and mapped onto the control parameters of the digital acquisition device. The rake includes a windrow width adjustment system for adjusting the width of a windrow of crop material formed by the rake, independent of adjustment in the width of the trolley. An alarm application receives an input time and date through the input device and determines an adjusted time and date. Simultaneously, the carrier film is drawn away over the separating edge for detachment from the film sheet.

1459828563-ee5b2aa0-337e-4370-9213-103cc05f584e

The protective helmet includes a rigid outer shell where the shell includes an undulating cross-sectional profile. One or more test cases are defined in a test plan for execution against a plurality of networked devices. The generating of proximity tables and the assignment of workloads is iterated for other hosts until all workloads have been assigned.

1459828564-50eb25a4-2756-493d-89dd-c22bb4a23555

A hitch-mounted game carrier apparatus for transporting and skinning game. These methods and apparatus further enable expansion of the load control system by connection of additional loads and or load control devices and or controller devices which will reinitialize the low voltage communication network and automatically reconfigure the controller devices and load control devices connected to the network. Each of the lock members is punched directly and extended into a shape for being cut into two corresponding bending parts. After the weapon simulator has been fired a predetermined number of times, the bolt locking assembly will obstruct operation of the bolt and piston. The keyboard case has a cradling unit adapted for cradling a portable terminal after the keyboard is extracted from the keyboard case.

1459828564-642dbb54-f74d-4f5d-aa9e-fc43b3e7f3e2

An arthroplastic implant for a basilar joint of a hand of a patient includes a body having a distal surface and a proximal surface opposite therefrom. In one form, the address ranges are the same address range. In this example, each of the thermal inkjet printheads and piezoelectric printheads are connected to separate fluid

supplies to thereby enable each of the printheads to eject fluids having various characteristics onto a recording medium. Meanwhile, at the remittance destination, it is possible to send or receive a message without restriction of site, time, terminal, etc. The fixing portion and the blocking portion about opposite sides of the at least one first sidewall for preventing the at least one first sidewall from leaving a gap between the at least one first wall and the locking portion.

1459828564-a4ac3504-8beb-4778-ade4-31509e36efb0

The present invention relates to an optical interferometric apparatus and method for measuring acceleration, pressure, and pressure of fluids during flow using micro-opto-electro-mechanical-systems. The data is acquired in one acquisition pattern of a plurality of different acquisition patterns, which are determined so that an acquisition frequency of data in some areas of k space is different from that in the other areas of k space. The side boards are rotatably connected to the two side plates. The bias elements provide a current passing from the anode terminal to the cathode terminal that is below a characteristic hold current for the heterojunction thyristor device to thereby inhibit switching of the heterojunction thyristor device. After color samples are self organized and classified by SOM NN network, data can be categorized in clusters as a result of characteristic difference thereof. The enhancer is administered with the composition or separately, either systemically or preferably locally.

1459828564-acf52d28-8c74-478e-a513-368e09f4596f

A method and apparatus for selection of one or more ventricular chambers to stimulate for ventricular resynchronization therapy. The highlighted graphical elements are associated with the selected subpart of the mechanical design. Air passes through the wet channels where a material wicks moisture stored in a reservoir into the wet channels. A device link page is created, wherein the device link page contains a device button that is associated with each home device that is identified in the device link file. Subsequently, when the scalar quantity of the largest motion vector, among the motion vectors of each block in the determined observed photographic subject area, is smaller than a threshold  $v$ , the digital camera 1 judges that the user is attempting to perform a follow shot and there is no blurring of the photographic subject, and performs automatic shooting. A portion of the logic synthesis transformation is driven by the power consumption optimization; and, the statistical data about circuit activity maintained at the nodes of the circuit during the synthesis process is used to calculate the power consumption at various points in the process of synthesis transformation.

1459828565-444b31fb-fcfa-4bc9-bbed-6450d7930156

A heatable vehicle window includes a bottom bus bar and a plurality of top bus bars. The dopant gas may be included in a plasma. The image forming layer comprises at least a lower layer and an upper layer. The software program preferably takes the onomastic elements from the selected name and compares the onomastic elements to the one or more databases. Then, the top surfaces of the shaved foam sheets are affixed together to form a pre-form assembly and the pre-form assembly is molded under heat. Each set up process corresponding to any subsequent DFT testing block requesting any hardware resource and any software processes that are already locked for use is paused until such locked resource and locked software processes are unlocked and assigned for having that subsequent DFT testing block enabled for testing.

1459828565-45f7914c-64c2-4903-99a4-5166b27bf0b5

The method of the present invention is capable of securely detecting LPP signals. The cover has a closed position for at least partially covering the body, and the key is accessible when the cover is in this position. An air flow module is arranged at the lower side of the shaped body.

1459828565-800a44f5-8fa2-44f4-a1c7-cc383603b89e

The cavity has first and second main walls covered by a photoresist. A first indication of quantities represented in a market for a first tradeable object is displayed in association with the price axis or scale. A return spring is operatively connected to the pivoting body and is mounted around an axis substantially parallel to said first axis. It should also be added that in one exemplary embodiment, the laser connector is configured to be releasably coupled to the wall and the line. A second displacement sensor attached on the second stage is used to measure a distance extending from the second displacement sensor to a plane disposed in front of the second displacement sensor.

1459828566-9525f40e-1b2d-4b76-a094-4f1e12b46736

A circuit configuration for supplying voltage to an integrated circuit via a pad that is connected to the input of a Schmitt trigger on the integrated circuit. The components comprise a first component parallel to the viewable surface, a second component parallel to the viewable surface and perpendicular to the first component, and a third component perpendicular to the viewable surface. The drooping piece formed by bending an end of the leaf spring of an automatic stop mechanism disposed on a top face of the upper blade is engaged and accommodated within the groove portion and a projecting portion projecting forward is provided at a bottom end of the groove portion. As a result, the voltage at the VBUS terminal falls to 0. According to the performance indicator, it is determined whether the current IP bearer network satisfies the performance requirements of the communication network planning model. The methods and resulting structures create a higher feature density, thereby increasing polishing uniformity.

1459828566-99d6463f-af2e-4b2f-8072-0c74f31b0eca

A new method for designing a tire comprises the steps of laying up a tire having a stiff lower sidewall portion that has a high modulus apex and a high turn-up and a concave shape, a flexible upper sidewall portion that is decoupled from the tread. Evaluation of a synthetic reaction product can be based on a quantitative measure of synthesis such as coupling efficiency or yield, and various parameters determined from a separation record obtained for the synthetic reaction product. The phases of the power supply may be synchronized and interleaved. A dynamic sense circuit detects whether the resistance of memory cells is within specified limits.

1459828566-fbcc7c01-4c8e-4acb-800c-6292cb750a85

A water monitor includes a stationary portion having a fluid inlet. With this configuration, the present general inventive concept provides a display apparatus in which a display main body can lift up and down relative to a base. The tapes are generally parallel to each other and include first and second tapes that are adjacent to each other.

1459828567-1d4af840-b286-41ae-8796-525dbf047cc1

A method of generating a simulation model of a predefined fabrication process according to a sample conductive feature includes receiving a geometry configuration and layout design of the conductive feature. In preferred embodiments the images are acquired while maintaining motion of the samples. Further, the resin film is as the lowermost layer, the adhesive layer is provided thereon, and the paper or plastic film with the image receiving layer coat is provided thereon. The memory matrix also includes a third column line distinct from the first column line and from the second column line. A dielectric layer is formed on the base layer and on a second portion of the trench isolation region peripheral to the base layer. The frame also has a back panel which also may be adjusted between open and closed positions.

1459828567-3bf80007-9118-40c5-ba2b-0a83b0e8c7f1

A composite laminate suitable for use in upholstery, automotive interiors and the like, which is made of a polyester felt substrate, an adhesive coating is contained on said felt substrate which obviates the need for a barrier layer for a vinyl

laminate, with a vinyl film overlaying and bonding with said adhesive to said substrate. The flexible drive shaft is connected to the input shaft of the attachment device and includes an outer end portion with a non-circular cross-section configured to engage a complementarily shaped cavity of an output shaft operatively attached to the power tool motor shaft. An initial location of the wireless network device can be calculated based, at least in part, on a location of each of the plurality of reference wireless network devices. The intermediate portions of corresponding contacts in the same channel are soldered with each other by heating the SnPb plating and a wicking barrier is formed on soldering area. N is a finite set of non-terminal help symbols, to be used for the derivation and the representation of texts.

1459828567-4d2b23e8-ac8e-4aa0-8d37-c2bb18f7e7ef

A method for visual tool identification employing unique indicia as an identifier of an owner of a tool. The cell array includes a phase change resistance cell formed at an intersection of a word line and a bit line and a dummy cell configured to discharge the bit line in response to a bit line discharge signal in a precharge mode. Two arcuate portions are spaced along the long end and the metal body is beveled in the vicinity of the arcuate portions so that the arcuate portions will engage the threaded portions extending beyond the lug nuts for two adjacent studs. A stable composition made according to the method includes at least one non-polar isothiocyanate and a vegetable oil. The electrically conductive material and the underlying dielectric layers are anisotropically etched to form a dielectric structure on which a gate electrode is disposed. Then decoding the codeword using an ECC decoder to obtain the user data symbols.

1459828567-7d6246c9-e2f9-434d-84e4-bd4b82009411

A methodapparatus receives a user selection of a predetermined standard for scanning sheets of media through a user interface and optically detects marks on the sheets of media using a scanning device to produce electronic images of the sheets of media. The sector map identifies one or more sectors of a storage volume and also identifies, for each of the one or more sectors of the storage volume, a signature of the content of the sector. During use, the prosthetic device is attached to tissue of the gastro-esophageal junction region of the patient, with the device positioned such that food ingested by the patient passes from the esophagus through the proximal opening into the interior of the prosthetic device, and eventually exits the prosthetic device via the distal opening. The transportation line portion is in electrical communication with a unit for sensing electrical signals. The bearing surface portion is substantially cylindrical, the sealing lip being directed downwards away from the rolling bearing and bearing with radial interference against the said surface portion, the said substantially cylindrical surface portion being connected towards the top to a shoulder against which the lip can bear if the two cups become radially eccentric relative to one another. A power system is coupled to the fragmentation device for energizing a transducer of the fragmentation device for fragmenting tissue.

1459828567-8024c005-58c7-46fd-8e69-5ae833492285

A display panel driving method capable of performing a good intermediate luminance display corresponding to an input video signal. This information is a list of highly probable error event patterns and locations found by employing a list Viterbi or a set of matched filters on Viterbi data. The invention also relates to a method suitable for producing a superconductor.

1459828567-c2b67d40-fe7a-4968-ba47-c1958340121d

A method of making chunk tomato pieces from tomatoes. A front housing covers the first surface of the LCD panel and expose the displaying portion. At least one chill core is positioned within one of the cope mold portion and the drag mold portion. Since the thermal oxide film 13 is a thin film of 100 \u212b or below, a low temperature of 450\xb0 C.

1459828568-63d0a062-5362-4cfb-a8c7-0ae09823036f

A snorkel splash protector attached at an upper end of a snorkel and having a housing connected to an end of the snorkel tube, a float member and a top cover. A gastrointestinal implant device is anchored in the stomach and extends beyond the ligament of Treitz. A determination is made to provide an event through a broadcast carrier over the first channel. The coarse mode tuning unit performs a coarse mode tuning operation on the oscillation frequency in response to a coarse mode tuning signal, and the fine mode tuning unit performs a fine mode tuning operation on the oscillation frequency in response to a fine mode tuning signal, to substantially compensate for a frequency error of the crystal resonator.

1459828568-c35a0017-e698-432e-921f-1d562e5cdd7e

A charge forming device includes a body with a fuel and air mixing passage, a bypass passage that communicates with the fuel and air mixing passage, a throttle valve and a choke valve. Moreover, opposing faces of the magnetic layers are positioned apart by a distance that causes each magnetic layer to form a magnetic circuit with the associated free layer and the associated soft bias layer. A first metal layer is electroplated on the first surface and a second metal layer is electroplated on the second surface. Further, the connector may be plugged into the corresponding malefemale connector port and be held in position by the magnetic properties associated with the connector and the port and/or by a lock lever mechanism. A pair of gates generates a corresponding pair of duty cycle adjusted versions of the input signal.

1459828569-0adcd165-eeb7-4028-8996-736882e7272b

A control system is for wind power plants including aerogenerators provided with DC modular converters. The dispenser comprises a circular base with a small inner cone having its largest rim integrally joined to the edge of a circular opening in the base. The first element includes a loop portion at one end which mounts a pair of D-rings for securing the gun in place on the stand. Still further at least one binding function for each of the stages is defined such that a pair of binding functions in two successive stages links the events in these two successive stages.

1459828569-4216eb67-4af1-4240-8a41-0888b003245f

A system for storing equipment in a rack comprises a U-shaped enclosure having two opposing side surfaces perpendicularly coupled to a bottom surface, and an attachment element for detachably coupling the U-shaped enclosure to at least one other U-shaped enclosure to form a plurality of configurations, such that an electronic component storage rack can be constructed incrementally. The system includes a plurality of sensors mounted to the lift platform and a control system coupled with a drive system of the lift vehicle. The first testing module, the assembling mechanism, the focusing module, the carrying mechanism, and the second testing module are all electronically connected with the main processor. The first trench and the second trench define device isolation regions and active regions.

1459828569-51d11563-fab4-45f5-adf1-11259533605d

A new and distinct cultivar of *Persicaria* plant characterized by multicolored leaves exhibiting a large, striking brownish black triangular basal spot surrounded by a silvery olive chevron and trimmed with olive green edges. The wick member has a downstream end in the outlet passage and a printer needle passage extends into the wick member from the downstream end thereof. A Register Save Engine has random access to one port of the registers in the final SRF in the chain, and saves/restores data between the final SRF and the BS, e. The first type of transistor is rated at a higher voltage than the second type of transistor. The voltage reference can be taken from the anode to ground, from the cathode to ground, or differentially across the programmable metallization cell device. Data is read from the recording medium and a determination is made whether the recording medium is further recordable based on whether a temporary defect management area

includes repetitions of a predetermined value or based on whether another predetermined value is recorded in response to a finalization command previously recorded.

1459828569-57f9126a-7993-480a-b746-1c676d239069

A flowsleeve of a turbomachine component is provided. The vapors collected from distal sources within the tank are carried to the manifold by means of internal vent lines thereby minimizing permeation emissions common of external vapor lines. The surface of the underfilm is contoured and includes flat regions, and less than 50% of the underfilm surface is occupied by the flat regions. Super-production is achieved by the combination of the high level of expression achieved from the T7 polymerase promoter and by cultivating the producer strain cells under culture conditions that delay lytic development of the phage.

1459828569-5de0b0cc-4fa5-4dbd-b121-20330e01c60e

A projection screen includes: phosphor regions arranged cyclically in an in-plane direction of a display region; a plurality of black stripes and reference black stripes that partition the display region into the phosphor regions; and an optical information formation unit that is provided in a specific position within the display region and that generates readable optical information. In one embodiment, the multichip module includes a substrate having a first side and a second side, the first side being opposite to the first side. The filament obtained has a variable thickness and a variable composition. The second end has a pair of legs extending downwardly therefrom and adapted to extend into the PCB, and an additional beam extending downwardly therefrom adapted for abutting against an edge of the PCB. The end seal is of a material having a coefficient of thermal expansion approximately equal to that of the epoxy material.

1459828570-567a3580-9f37-4fab-babd-4d33eb215cb9

A flexible collapsible corrugated drain pipe has a corrugation structure that permits a tight bending radius and relatively facile collapsing and expansion of corrugations, thereby permitting convenient manipulation and installation of drain pipe and packaging, display, storage and transportation of the collapsed pipe sections. When an electromagnetic wave radiated from a readerwriter of a PDA 2 is received in a readerwriter of a personal computer 1, the personal computer 1 notifies the PDA 2 of device information stored therein. On the respective sub-areas, composition images are displayed indicating different compositions and object regions different from each other. Said metal sulfate product is then leached with dilute sulfuric acid to form a metal-containing solution, from which the metal values are separated by precipitation at raised H<sub>2</sub>SO<sub>4</sub> concentrations obtained by saturating the solution with the gaseous SO<sub>3</sub> from the sulfatization reaction step. With the laser irradiation, the functionality of the organic layer of the organic EL element is selectively degraded and the light emission capability is removed without damaging the cathode.

1459828570-b0acbba8-2026-4fe2-9cb1-51e46345590f

A system and method for managing a database is provided. The unitized frame has interlocking tabs on folded side plates of a base frame. The detachable accessory is insertable into and removable from the storage chamber such that the operating end leads during insertion into the storage chamber and the non-operating end leads during removal from the storage chamber. The actuation system is capable of moving the contact pad and the restraining system relative to one another to create a shear force across the target area of the user's skin to thereby provide tactile information to the user.

1459828570-b6fedca5-7aa1-45b0-b8e9-e3360eb2c27d

Various embodiments of light emitting devices with efficient wavelength conversion and associated methods of manufacturing are described herein. The method forming a semiconductor that includes flash memory cell having floating gate, then forming a

the substrate. Through the operation of the network, the master device can obtain the identifiers of the slave devices, and connections among the slave devices can be ascertained. The gas is removed from the quenching liquid. The female member is inserted by and locked with the male member while the pulling member is connected to the U-shaped part of the male member.

1459828571-4e319921-a736-4cdf-89ce-c2c393cb0d2d

Clogging of a distillation column by polymerization caused by a change of the production rate of acrylic acid, is prevented to carry out a stabilized operation over a long period. The source and the drain of each FET capacitor are coupled to one another. A communications-terminal selecting unit is configured to select out of the communications terminals one which has the need to change the downlink transmission rate in accordance with the downlink transmission qualities obtained at the transmission-quality obtaining unit. The tensioning system has a first idler plate configured to bias a first idler pulley against the drive belt when the drive is rotating the shaft in the first direction and a second idler plate configured to bias a second idler plate against the drive belt when the drive is rotating the shaft in a second direction.

1459828571-7d141a0d-5cd6-4aef-850b-8bcc30289876

A method is for calculating a height of a chuck top. The facet joint includes a superior articular face and an inferior articular face. A clip is operably coupled to the bracket to secure the sensor. The to-be-machined surface of the work so superfinished represents a smooth surface free from any machining trace such as a crossing-angle pattern. A quickly circulating tool for creating a mixing cone is disposed between an upper interior portion and a lower interior portion of the receptacle.

1459828571-ab4ce017-5c87-4b68-9cd5-3ad00d73b9c2

A method is provided that utilizes a parallel processing system to determine whether different geometries intersect each tile in a map hierarchy. The return path transmitter further includes an RF signal receiver, coupled to the optical signal receiver, configured to receive and convert the analog RF data signal into a second digitized RF data stream of digitized RF data samples at a rate determined by the sample clock. The crotch panel is openable and reclosable with respect to at least the second waist panel. According to a further aspect of the invention, the electricity being transmitted from the power generating site to the transmission line may be reduced by diverting at least a portion of the electricity being transmitted from the power generating site to a storage system. 01 to 20 ; C from 5 to 200 parts by weight of calcium carbonate powder with a BET specific surface area of from 5 to 50 m<sup>2</sup>/g; and D a platinum-based catalyst, used in an amount capable of inducing curing in the present composition. A liquid-level gauge testing method is also disclosed.

1459828571-c4a2233a-b3d9-4190-9347-5fdc8a7b0c79

A magnetic head including a plurality of head element units provided along a width direction with respect to a magnetic tape. The actuator includes drive electrodes and side electrodes. The echo profile is used to calculate the cyclic prefix length needed for optimum communication from one node to the other. A motor is installed on a first end of the drum, and provides a rotating force to the agitating screw.

1459828571-d7bcd97c-06ce-44e4-8366-f004e3878acd

The present invention provides methods for preparing TLR-4 receptor agonist E6020 and stereoisomers thereof, which compounds are useful as an immunological adjuvants when co-administered with antigens such as vaccines for bacterial and viral diseases. Further, the invention relates to methods of treating a disease selected from asthma, COPD, allergic rhinitis, adult respiratory distress syndrome, bronchitis, allergic dermatitis, contact dermatitis, idiopathic thrombocytopenic purpura, rheumatoid arthritis and allergic rhinoconjunctivitis by administering an

appropriate amount of a compound of formula 1 to a patient in need thereof. A first baffle extends downwardly from the top of the vessel downstream of the inlet and a second baffle extends upwardly from the bottom of the vessel downstream of the first baffle, with a first hopper for solids collection located upstream of the second baffle and a second hopper downstream of the second baffle. Some further embodiments position drives in a herringbone pattern to redirect air flow in addition to reducing rotational-acceleration vibration interaction.

1459828572-87e8c920-4d70-4e08-9b23-2c93d135f7e3

An integrated process for preparing a lubricating oil base stock includes an isomerization step followed by a solvent dewaxing step. A mounting system for the grass collector comprises a mount that pivotally couples the lower portion of the grass collector to the mower frame. Predicting future navigation data involves receiving navigation data and using the received navigation data to generate predicted future navigation data, wherein the predicted future navigation data should be approximately identical to navigation data received at a future time. The memory cell transistor has a charge storage layer whose side surface lies in the same plane as the side surface of the element isolation regions. The amplifier circuit is suitable in particular for Hall sensors that are operated in chopped mode. The plate has a gypsum core at least partly sheathed with a nonwoven glass fabric.

1459828573-157c325f-397f-40ff-8620-cb9216b6ea07

A vehicle has a crash detection device for detecting a crash that introduces a force acting in an effective direction into the vehicle. True reflect lines are then calculated and displayed on the deformed FEA springback blank, and the reflect lines are compared with the true reflect lines on the CAD model to determine variance of the deformed springback blank with the CAD model. A claw release portion and a claw covering portion are arranged in the connector cover in a rotation direction.

1459828573-1587fa51-4d88-4c1c-818e-5b55b1c775af

A system and method of controlling ciphering of call information between a mobile communication terminal and a network initiates the transmission of a ciphering request from the terminal to the network. The kit includes first and second column anchors operable to be mounted in the ground. The stiffness is selected to increase a resonance frequency of the test fixture to allow fatigue testing at higher frequencies for a wider range of samples. Certain of the sorted values are eliminated from prescribed ones of the groups in accordance with prescribed criteria based on the number of values in the group and the median value of the group values. The gear train includes an input member coupled to the control tab and an output gear coupled to the shaft.

1459828573-248a30b2-aec9-4b45-8bb8-74b5b3c0d091

A microscope apparatus organizes and stores a plurality of types of image information acquired by a plurality of image acquisition methods at different timings. The modified atmosphere may be air at a temperature of about 65 C. A sprayer head is linked to a supply hose and has a recess adjacent a base portion of the sprayer head.

1459828573-5f2152c8-4965-4d7b-a84b-facef5031dcb

A filter assembly and a method of filtering a fluid using the filter assembly are disclosed. The GPT assay kit is stable over a long period of time. The liquid-delivering pump is driven to generate a negative pressure inside the printhead to circulate the ink between the printhead and the ink tank. The drilling fluid provided in the present subject matter has advantages including easy use, high environmental friendliness, and outstanding reservoir protection, greatly reduces the damages of drilling fluid to highultra-high permeability reservoirs, and brings substantial economic benefits. The controller uses the primary sheet conveyance

path to execute one job, and uses the secondary sheet conveyance path to execute another job in parallel with that one job.

1459828573-85f6a690-d707-42b6-86f7-e33ab47b68c2

A proxy system enables a worker remote from a communication center and limited to a light computer device unable to operate as a workstation at the communication center to operate with full access to data and software at the communication center. The system includes a multi-rail conveyor, an imaging unit for each rail of the conveyor and a computer including a user interface. In another embodiment, a flash memory device comprises a memory array, a controller and a register. Class definitions may be established on the basis of typical parameter values for a particular type of service, and may be modified over time as those values change.

1459828574-10726d6d-ecf8-45cd-ae85-ea1ab4760eb1

Techniques for generating a bias voltage for a class AB amplifier having first and second active transistors. According to a feature of the present invention, the method comprises the steps of determining spectral information relevant to the sequence of images, and utilizing the spectral information to classify a pixel as one of background, shadow and object. The box can receive various articles, for example compact discs or an insert which can hold and support the disc in the box.

1459828574-52f892b0-7a65-4c94-abaf-b735779ecb94

An illustrative semiconductor structure described herein includes a substrate including a logic transistor region, a ferroelectric transistor region and an input/output transistor region. The image-forming apparatus includes an acquisition unit configured to acquire the access-control information based on a signature included in the flow setting information if the flow setting information includes the signature, and a flow-performing unit configured to perform the flow based on the access-control information acquired by the acquisition unit. The frusto-conical extension is adapted to lie in the opening with a larger-diameter end inward of the housing, and to make substantially a line contact with an at least partially spherical surface of the valve control member when the latter obturates the opening. Further, when realizing panoramawaterglass functions, the scaling ratio function is variably set, thereby variably realizing memories having sizes which vary according to the scaling ratio function. The network server provides a graphical user interface that the transmitting user accesses over the Internet to access the staging directory. The cleanup equipment is retracted after the testing is completed so that it will not impede the advancement of the drill bit at the lower end of the string.

1459828574-e9738baa-5747-454b-9ed5-47b75c3960f0

A method, system, and program product for data replication comprising, building a virtual image of a point in time in a Data Protection Appliance, taking a storage array based snapshot of a current image, creating a hot pull session and exposing a LUN containing the point in time image at the DPA. In one embodiment, the communication system utilizes a fan out, pencil beam arrangement in which electromagnetic energy is transmitted from a hub to customer premises equipment with a fan or similar antenna and from the CPEs to the hub via pencil beam antennas. The control is responsive to an output of the imaging array sensor to determine a distance between the imaging array sensor and the object or light source of interest external to the vehicle sensed by the imaging array sensor. A motion direction angle  $\theta$  is determined from distribution motion amounts  $X$ ,  $Y$  to the axes. The overlaid signals may completely obscure the background signals, or they may provide a level of transparency by allowing the background signal to be partially or completely visible.

1459828574-ffc5c249-f820-4a56-aa71-ff4aaa7d7378

A continuous well string injection unit and balancing system, in which the continuous well string injection unit is suspended using a sling connected to a

pair of suspension points. The lever and the body, one of which is fixable to a frame of the appliance and the other to a door, are tiltably hinged to each other by a first pin to make the door movable between open and closed positions. The present invention also relates to the use of the novel boronic chalcone derivatives to treat cancer. The circulation mandrel is secured at opposite distal ends in threaded Y-adaptor boxes. The tip includes a resistive area, and first and second semiconductor electrode areas.

1459828575-47271446-a2bb-449d-be83-c9a0b0a2521f

Some aspects of the disclosure relate to a data storage system that includes multiple memory device storage devices. The gaming system progressive award is associated with a designated quantity of points wherein the first player at one of the gaming devices to accumulate the designated quantity of points is provided the gaming system progressive award. The readwrite element includes an upper magnetic pole piece, a lower magnetic pole piece, a coil, and a resist filling around the coil, and a read element for performing reading, and an upper shield and lower shield for protecting the read element from an external magnetic field. When the pusher pushes the master piston forward, amount of volume increased in the boosted hydraulic pressure chamber is set to be substantially equal to amount of volume decreased in the input chamber.

1459828575-911859f5-13a2-45d6-b347-8cf207fb938d

A waveform dividing method for a capacitive touch control device saves a first waveform in a direction, and then saves a multi-touch waveform in the direction when another object further touches the capacitive touch control device. The tuning of the power splitting ratio is achieved by varying an effective refractive index around a portion in a multimode interference section. In one configuration shown, the serial chain of memory devices includes a chain of devices where each device is a stacked die memory device. Here, the at least one object property represents a movement state and an object position of the object with regard to a vehicle position of the vehicle and/or with regard to a roadway in the area in the driving direction ahead of the vehicle. The surgical fasteners are simultaneously deformable upon activation of the actuator such that a distal end of each surgical fastener secures each end of each luminal structure to complete the end-to-end anastomosis wherein the resulting eversion is exterior to the luminal structures.

1459828575-9f7a874b-0196-4859-bad7-0ae3dbcfffb4f

A method for judging a lost block characteristic in a video processing system including certifying whether a lost block exists among transmitted video blocks, calculating a temporal difference cost<sub>1</sub> between neighborhood pixels of the lost block in a present frame and a previous frame, and calculating a motion vector distribution value cost<sub>2</sub> of peripheral blocks of the lost video block. The model has a plurality of nodes representing spatial locations within the environment, and the principal direction for each node is determined probabilistically using linear features detected within an image of the environment. The error signal is used in adjusting the weighting coefficients. The anchor assembly also includes an attachment mechanism to secure the remediation materials to the retainer structure. This view can be selected by the driver by, for example, touching the screen upon which the bird's-eye view is displayed. The driving member can be easily replaced by disengaging the pin from the engaging recess of the driving member.

1459828575-f8e2535d-1e43-4908-bbb8-0e47c50f5aeb

An uninterruptible power supply includes an input switching circuit, an AC-to-DC converting circuit, a bus capacitor, an energy storage unit, a charging circuit, a DC-to-DC converting circuit, and a system control circuit. The system divides the first collection of data objects into m possibly overlapping groups of average size s and computes one combined hash result for each group. With this system design, a user's setting can be made effective only for a picture portion in which he is interested. The tip 10 includes a coating 17 bonded to the outer surface of the

anchor portion 13.

1459828576-4ed774b9-f9fc-40dc-b0b3-cfe1cb2a06ac

It is a problem to provide an electric apparatus less in consumption power and long in life by the manufacture using the display device. The first electrode is transparent. A central disk is fixedly carried by the diaphragm and is biased by a first spring that applies a restoring force upon displacement of the central disk. The method, from the first virtual machine, accesses the second set of resources to partition a file system for storing the second virtual machine. 5 event which imparts tolerance to glyphosate and at least one ALS-inhibiting herbicide are provided.

1459828576-5b8e46dc-1f56-4bf0-b9e2-a8c41b4becce

The tensioner includes a cylinder inside a large capacity reservoir tank without interference with other components. The device comprises measuring means for recording a first and a second signal, wherein the first signal represents the motion characteristic of an angular position of a first reference point of the shaft and the second signal represents the motion characteristic of an angular position of a second reference point of the shaft. The powertrain includes an engine and torque converter that is continuously connected to at least one member of the planetary gear arrangement and an output member that is continuously connected with another of the planetary gear members. The sled enables collection of a large volume of lawn refuse without relying upon additional mechanical devices to complicate the operation of the lawnmower.

1459828576-e662ddc2-437e-454d-84aa-ec5ea8ed1ade

Aspects of the invention provide a method and system for coding information in a communication channel. One or more optical transducers are attached to the first surface of the substrate so as to emit or detect light via the respective openings. First and second drive mechanisms, together with suitable connectors, are provided to mechanically rotate the platen about the perpendicular and parallel axes. The Drop Index Analysis allows users to specify: how many indexes to consider dropping, and/or how much disk space that dropped indexes should free up.

1459828577-1b6c8c47-ffc8-43dc-9f2b-4664b6105a6a

A urine suction device improved to achieve quick urine which includes a urine receiver unit and a urine detector unit. The testing apparatus includes a housing with the configuration of an air foil. Expansion and contraction of the chamber occurs by either the plunger reciprocating in the chamber or a piston coupled to the plunger reciprocating in the chamber. Thereafter, the method may use a dynode current of the PMT for detecting the features, defects or light scattering properties of the specimen.

1459828577-26550f68-1755-4812-bb05-498f86d7ef7b

The combined light source and air purifier unit includes a body and a centrifugal fan with rearwardly facing blades run at low speed and mounted by the body with its axis upright and a central intake through which air containing contaminants is drawn from a target zone below the unit. The injector is formed by drilling or otherwise forming a hole at an angle to the surface of one or more sidewalls of an engine nozzle or other device. The accelerometer also includes a proof mass, a magnet mounted to the bottom piece of the excitation ring, a pole piece mounted to the magnet, and a coil attached to the proof mass that extends into a gap between the top piece of the excitation ring and the pole piece. A plurality of hanging holes corresponding to the hanging hooks is disposed at the top and bottom of the lens for fixing the lens onto the frame. A flap sealing assembly includes a pair of compression plates positioned outside the flaps closing assembly. Accordingly, since the high frequency band signal is encoded and decoded by using the low frequency band signal, encoding and decoding can be carried out with a small data size while avoiding deterioration of sound quality.

1459828577-29b3a3f2-775f-43a3-818c-02960faba972

Methods and compositions for inducing immune suppression are disclosed. A terminator is added to part of NAL units extracted from a packet immediately before the transport stream packet is lost, and data on NAL units up to a NAL unit whose start code is detected is discarded after the start code of the NAL unit contained in the transport stream packet is detected and a terminator is added thereto. The reference counter of each of the cache lines in each cache level is tracked so that a cache line is not overwritten with new data prior to transferring old data out to the recipient device. Springy tabs are bent up from the metal backing plate of the screen unit, and these springy tabs serve to cushion the impact of the screen unit against the mounting frame, in response to the edge or corner impact, leading to a marked improvement in drop test performance.

1459828577-b010a4e4-2a22-4fe1-a053-5a543fe6596e

Thiophene-containing photo acid generators having either of the following general formulas: . The systems, methods, and data structures may convert the link travel time into a vehicle speed and correct the converted vehicle speed if a the vehicle speed or a first speed change amount is equal to or larger than a predetermined value. The control section generates a control signal in response to a bank activation command and a bank activation signal for enabling memory banks.

1459828578-038e1c8c-d019-4ac2-9de5-cef07edbee2c

The present invention relates to a supporting structure having function of rod-linkage latching which comprises a connecting unit, a base seat, a base seat hinge, a main hinge, at least one rod-linkage mechanism and at least one rod-linkage latching device. The first housing portion defines a first plane and has a first support member arranged thereon at a first angle to the first plane. A signal processing module for receiving the detector output signal is configured to produce an output profile of the relative temperatures of objects in the monitored area. Systems and methods are also provided for sharing data without replicating the data on an end user machine.

1459828578-44b28d83-8e05-4c33-90e4-fc9d58a465a9

A method for fabricating a bipolar junction transistor on a wafer is disclosed. In one embodiment, the method includes but is not limited to receiving at least one packet, and disposing of the received at least one packet in response to a walk of a Balanced Hash Table of ABCTs, where the Balanced Hash Table of ABCTs encodes an Access Control List. A fluid deflecting plug includes a comparatively large area top and a comparatively small area base. A memory editor links a telephone directory of a mobile phone unit and a telephone directory of an IP-PBX in cooperation with a telephone directory controller of the IP-PBX. The patterning exposes regions of the semiconductor wafer between the integrated circuits.

1459828579-74423974-9df6-4ede-940d-e8a81d2dd901

A device for testing the adhesion of a coating to a substrate and a method of using the device are disclosed. During operation the system receives telemetry signals from sensors within the computer system. An inorganic insulating film is not attached to the sides of the base electrode. The control module is configured to vary the operating parameters of the amplifier circuit based on a desired output power level. Since the LED lamps can be individually replaced, untrained persons can carry out the replacement operation.

1459828579-87b14918-59b4-4daa-b7f1-05a17ceccfd7

A method of forming a polishing pad with a polishing layer having a polishing surface and a back surface. The sensor unit may measure a biosignal of a user, and the headset body and the sensor unit are indirectly connected by the connection unit. The block decoder outputs first and second block select signals in response to pre-decoded address signals and first and second plane select signals, which are

respectively enabled according to an enable state of the planes. It may be formed of a plurality of wedge-shaped pieces of wood, and the two species of wood may be joined by interleaving these wedges over part of the bat's length.

1459828580-7e5f9bf7-e4a0-452a-93f5-bcda0b2671d5

Systems for providing a tune master internet protocol device includes a communications network configured to provide caller identification information for an incoming telephone call and a processor that is coupled to the communications network. The method for preparing a conductive polymer solution of the present invention comprises adding a phase transfer catalyst adding an organic solvent to an aqueous polymer solution prepared by dissolving the  $\pi$ -conjugated conductive polymer and a solubilizable polymer in water. If the timer reaches a set value, indicating a sufficiently long period of inactivity, then the transmission sequence number is reset to zero or another predefined value. The clock source selector can be used in an integrated circuit to form a glitch-free multiplexer. Further, the present invention relates to methods of determining the timing of treating a disease in a subject in which the immune system is cycling. A target solution is mixed by agitating the mixing beads while the target oligonucleotides are hybridizing to the complementary probes on the array.

1459828580-dd338102-8e8b-4529-a7d3-37743615ba69

A sharpener to sharpen the edge of a food slicer blade includes a non-planar abrasive surfaced rotatable disk mounted on a supporting structure. The apparatus has a motor with rotating driveshaft that defines a rotational axis substantially parallel to a surface of a body of water. In this manner, the x-ray detection photo diode enables the electrode structure to be changed.

1459828581-198cdeb8-cc43-497a-bafc-2682b095a0d7

The invention provides pyrrolo3,2-dpyrimidine derivatives represented by formula, and their medically acceptable salts. Individual characterization incorporates an inference engine which formulates client composite images which vary with time. The decoded data generating unit generates decoded data corresponding to the compression data based on the reference compression data extracted by the reference value extracting unit and the compression data. In the heat transfer process, after imaging, the image receiving layer and melt transfer layer are peeled away from the optionally barrier-coated support material and placed, preferably image side up, on top of a receptor element. Recording and reproduction of information can be performed likewise by using a recording or reproduction light beam accompanied with one or two tracking sub-beams.

1459828581-6040c3e4-7d7b-41c6-8b3b-8d95480c1bef

The present invention discloses new live attenuated strains for oral immunization against cholera that are provided in freeze dried formulations for long term storage and administration to humans. The procedure according to the invention ensures an improved result of cold forming, or even enables the manufacture of specific component shapes in the first place. A drive mechanism is employed to rotate the mounting table integrally with the die assembly about the axis of the die assembly. The privilege granter routes the session packet to an addressable service. The preferred method can be used with a general computing environment or in an embedded system. In response to a transition of a configuration item between state values, a message value and requester identifier that are associated with the transition are selected, and the message value is sent to the requester referenced by the requester identifier.

1459828582-84aaeb5b-5862-4a41-8aa0-7c7a7a1644d5

Provided is a degassing container for a refrigerator in which a portion of air within a storage space is forcibly discharged to allow the storage space to become a low pressure state. When a user initiates a login session on a secure site using a client computer system, matching login session identifiers are displayed on the

client computer system and a mobile communication device uniquely associated with the user. 10 siemensm; and allowing a first electrical current to flow in a first current path in the meander line.

1459828582-b15443ff-f5eb-435c-8b92-4e2d580ecd7c

According to one embodiment, an information recording medium includes a video object area for recording a video object formed of video object units which is a minimum unit for reproduction, and a highlight information pack which is included in the video object unit. In one or more arrangements, the contact member may be disposed on the support member and include a contact portion configured to contact a sheet being conveyed. The source coil, and first and second sensing coils are embedded in the circuit board, and each of the first and second sensing coils are constructed and arranged to provide an output as the object passes by source coil and the first and second sensing coils.

1459828583-c6672a65-a698-4216-805c-d35bac1d1454

A display device includes a display panel, an electromagnetic touch panel, and a backlight module overlapping one another. A solvent for asphalt dissolves the asphalt constituent to form a slurry of asphalt-solvent liquid and the solid materials. Each one of such processors provides a plurality of sets of successive processor addresses. New texture is synthesized using the texture parameters in combination with a set of constraints. The adhesive is then cured to form a bonded joint, the bonding grid being incorporated into the bonded joint.

1459828584-48a7afa7-d831-4f25-abf7-b11a923e5cbb

A non-volatile memory cell and a high voltage MOS transistor on the same semiconductor chip without changing the characteristic of the non-volatile memory cell. Also, an electrophoretic display device includes a display device comprising a pair of substrates in which a light-transmitting electrode is formed on at least one substrate and the medium for electrophoretic display described above between the substrates. The items may be installed and movable onto and off the vehicle.

1459828585-0674ec20-0c48-4486-86a5-14bdafbfb4989

A calibration device for a parallel kinematic manipulator having a base unit and a manipulator platform movable with respect thereto, the manipulator platform being connected to the base unit via a plurality of joints and a plurality of variable length actuators. The system acquires data that represents an event in the life of a business enterprise, such as a transaction between the enterprise and one of its customers, and loads this data into a database table. The generation of the bubble causes the ejection of a drop of an ejectable liquid through respective corresponding nozzle, to effect printing.

1459828585-331cc9bf-a368-463f-989f-bdafe503b188

Methods and apparatus for use of a stacked, reconfigurable system is provided. In one embodiment, the applicator provides the disclosing agent to a tooth surface and a composite filling of the tooth. The swing wing tip assembly has a dual load path structure configured to transfer load from the unfixed wing tip portion to the fixed wing portion. Each integrated push cap having a pair of ribs for snubbing and seating a pair of conductors into the insulation displacement connectors and one or more pair of chambers for isolating and gripping the ends of the conductors.

1459828585-bff2c35e-a862-4727-a512-c2c333bc3524

Method and device for reading data from a semiconductor device, where  $t_R$  is a read operation time,  $t_T$  is a buffer transfer time, and  $t_H$  is a host transfer time, where at least two of  $t_R$ ,  $t_T$ , and  $t_H$  may be overlapped to reduce a total transfer time. A system of the present invention comprises four rectilinear working conductors in the shape of busbars which are assembled in pairs on each lateral side of the object to be treated over the whole length thereof, wherein said busbars are arranged one above the other at a distance determined by the object height. The

pick-up gear is rotated when the motor is rotated in a first direction, the feed gear is rotated when the motor is rotated in a second direction, and the discharge gear is rotated constantly in one direction regardless of the rotation direction of the motor. The milk frothing system additionally includes an expansion vessel, having a water chamber and an air chamber, said water chamber being connected to a point of the water conduit, downstream of the pump and upstream of the heater, and said air chamber being connected to a point of the air conduit, downstream of the first check valve and upstream of the second check valve provided therein. The grid has a higher tensile strength to weight ratio and a higher creep reduced strength to weight ratio than corresponding ratios associated with a grid made from a non-polyethylene terephthalate starting material.

1459828585-c58ca006-a9bd-4c27-b732-b8a3cf4c22c0

An electroadhesive gripping device or system includes a plurality of electroadhesive gripping surfaces, each having electrode and each configured to be placed against respective surface regions of a foreign object, such that one or more electroadhesive forces can be provided between the electroadhesive gripping surfaces and the foreign object. Excessive Th1 cell mediated immune responses are caused by such autoimmune diseases and chronic viral and intracellular bacterial infections as Psoriasis vulgaris, Multiple sclerosis, Rheumatoid arthritis, Crohn's disease, insulin-dependent diabetes mellitus, Tuberculosis, Acute graft-versus-host disease and HIV virus infection. The apparatus includes a memory adapted to store a current and previous fields and predetermined portions of a future field of an input signal. The system may also comprise a co-extruder configured to extrude the a material layer and a collagen gel layer about the exterior surface of the base layer that is then at least partially coagulated before receiving the grill treatments. An anchor factor is used to preserve the mean tone level for each color while the tone levels far from the mean tone level are changed more dramatically than the tone levels close to the mean tone level, which minimizes hue shifts while maximizing contrast enhancement. In addition, the void filling scheduler is used in conjunction with bandwidth grabbing to improve scheduling performance.

1459828586-3a7a8dc6-82bd-4b58-b80f-626c31779337

A data storing system performs a test operation on a memory block on which a read operation is determined to be failed, and determines whether the memory block is or is not a bad block based on a result of the test operation. An inband bit decoder decodes the inband bit portion of a received frame to obtain confidence levels associated with each of the M codec modes. Then a first N-type well, a first P-type doped region, and a first N-type doped region, are formed on the P-type substrate, wherein the first P-type doped region and the first N-type doped region are coupled to the specific voltage point, respectively.

1459828586-4d001c52-9235-4c6b-bade-c84c11be9c5a

The present invention makes it possible for a virtual higher-level device disposed on a virtual platform to use prescribed data related to an application. The cleaning composition optionally contains dyes, glycerol, builders, fatty acids, polymers, fragrances, colorants, anti-foaming agents and preservatives. The release layer comprises a maleic anhydride polymer selected from a maleic anhydride copolymer and a maleic anhydride graft polymer. The subject reagent test strips include one or more members of an analyte oxidation signal producing system and at least one hemolyzing agent.

1459828587-3c1e2ce4-d039-4231-b1b2-cd9e5f51aa06

Techniques for correcting the color uniformity of a laser printer of a digital press or other device are provided. Characteristically, said organosilicon compound is chosen from the family of crosslinked, cyclic or branched oligomers and resins, which have a number-average molecular mass of between 500 and 10 000 and which consist of units of formula  $\text{SiO}_4$  and units of formula  $\text{SiO}_x\text{R}_y$  z. First and second internal electrodes which are opposed to each other within the capacitor body are

respectively electrically connected at ends thereof to the first and second side-surface terminal electrodes, and are also respectively electrically connected to the first and second major-surface terminal electrodes through via hole conductors. Thus, it is not only possible to appropriately control the temperature in the processing vessel, but it is also possible to reduce space and energy, by combining the resistive heater with a thermoelectric conversion element. A pair of fixing elements each has a first fixing slice secured in the first fixing groove.

1459828587-d9edf8ff-47eb-4212-835c-7d6c6ccd4ec0

A sensor assembly including a sensor and a data storage medium, on which the specific data of the sensor, such as type, measurement range, calibration date, serial number, manufacturer, etc. Alternatively, color image data are received, and histograms of a plurality of colors on the color image data are calculated. The wrench rack may include a handle pivotally connected with the board. The system automatically links top level indicators to core and sublevel process and quality outcome indicators. The processor receives an image frame corresponding to an image of the surface of the calibration tool, performs edge detection on the image frame to determine a position of each of at least one detected pattern edge, and generates the calibration information with reference to the position thus determined and the corresponding predefined location. The coated amphetamine-ion exchange resin complex is in admixture with a polymer to form a matrix.

1459828588-15ac31bf-b4d5-439a-bdd3-934de71f78e1

A service AP conducting ordinary business processing is executed on a first OS. The method includes the steps of providing a first section and a second section of the printed product with an identical array of stitching locations, each stitching location receiving a stitch or being punched through. An active air removal controller removes detected air from blood in the air removal device.

1459828588-58f46b2f-77d6-4fb7-ad2e-936c0c30cf3b

Systems and techniques for providing a master data framework. A source of audiovisual content transmits corresponding digital data to one or more endpoints, such as over a home network, where it may be buffered and/or decoded for playback. This enables the maximum effect to be realized with the necessary minimum polishing, without setting special conditions and which is suited as a finishing tool. The light sources provide a light beams. The use of decreased extrusion pressures also results in increased uniformity in aerosol generation and improved reliability of other components.

1459828588-7f50a12c-79ff-48f8-97f9-f0b74ca21ecd

A new cultivar of *Camellia sasanqua* named 'Green 99-016', characterized by its dense and upright plant habit, its white double flowers that have a very high number of petals and petaloids imparting a carnation-like appearance, its vigorous growth habit, its dark green foliage, and its good resistance to *Phytophthora* sp. The plurality of metal chalcogenide nanocrystals are then grown without injection of either the metal source or the chalcogenide source at a temperature at least equal to the sufficient temperature, wherein growth proceeds substantially without nucleation to form a plurality of monodisperse metal chalcogenide nanocrystals. Acoustic energy may be introduced to a focal zone and narrow band interrogating signals may be used. A processor determines an alignment position of the substrate or the reticle based on the alignment signal. The interelectrode insulating film covers whole side portions of the floating gate electrode located in a direction different from a direction in which the word line extends, and the control gate electrode covers the side portions of the floating gate electrode located in the direction different from the direction in which the word line extends.

1459828589-0d0b3976-e958-4d28-949e-0acb8c3ca32f

Embodiments of a wireless access network and method for IP multicasting are

generally described herein. The obtained heat exchanger has a long last good corrosion resistance and can prevent occurrence of fin detachment and pit corrosion. 5 KHz to about 50 KHz may be applied to the patient's spinal cord region to address low back pain without creating unwanted sensory and/or motor side effects.

1459828589-fa929348-e2ce-43ec-bf0a-8b9739851f48

The present invention teaches, that the removal of particles of any charge from liquid stream is possible by mechanisms other than sieving with good flow and low pressure drop. Extension of the under-bump metal laterally from the gate contact with the gate pad metallization out to two or more gate pads not overlying the gate pad metallization minimizes the risk of delamination of the metallization due to thermal and mechanical stresses in assembly and operation. The delay reduction is also based on locally dedicated input buffers for each data transfer circuit, and for applying thereto a buffered replica of the external signal present on the metal line. The ferromagnetic films magnetostatically couple to the free layer which causes the free layer to be in a single magnetic domain state. The level shifter may either couple or decouple input circuitry from a reference voltage in response to a firewall enable signal, may translate signals between a first voltage domain and a second voltage domain when the firewall enable signal is deasserted, and may generate an output signal having a predetermined one of either a high or low state when the firewall enable signal is asserted.

1459828590-2c3958fb-8c50-44d1-ae2e-aa4c7c06b887

The magnetization state of a ferromagnetic layer can be set to correspond to different values of a data item to be stored in a hybrid memory device. In one embodiment, codewords are redundantly used in order to decrease the total number of bits required for feeding back acknowledgment information or in order to increase the Euclidean space between codewords. In effect, resonance induced mechanical wear is reduced which leads to an increased life time of the wind power plant. The programmable voltage bias circuit of the present invention uses the temperature dependence of the output supply voltage to make the gate delays of the buffer temperature-independent. The sustained release compositions of this invention comprise a biocompatible polymer having dispersed therein, a biologically active polypeptide and a sugar.

1459828590-caad29b2-570d-43cc-a6f6-e8a6c7070b82

In a simple method and device for producing plasma flows of a metal and/or a gas electric discharges are periodically produced between the anode and a metal magnetron sputtering cathode in crossed electric and magnetic fields in a chamber having a low pressure of a gas. One end portion of the elastic member is fixed to the supporting member, and the other end portion is a free end portion whose tip edge is to be contacted with a member to be cleaned while rubbing the surface to remove a residual material therefrom. In response, one or more cellular router failure notification packets are sent by the cellular router prior to failure to one or more nodes within a cell served by the failing cellular router. The connection component is connected to a portable electronic device. The method comprises suspending a request responsive to detecting of a condition indicating a lack of a resource necessary to serve the request; applying a resource management procedure to increase availability of the resource; and, responsive to successful completion of the resource management procedure, serving the request.

1459828590-e416fc82-7d45-46ce-830f-ae7c9dbfcc80

Apparatus, and an associated method, for controlling the power levels at which an EDGE-modulated signal, or other signal which includes envelope varying-portions, during operation of a communication system. More particularly, the present invention relates to solventless curable PSA compositions suitable for forming pressure sensitive adhesive compositions having improved high temperature cohesive strength while maintaining good tack and adhesive properties. Heat may be applied

to the formation to raise a temperature of a portion of the formation to a pyrolysis temperature.

1459828591-61d01c3a-72aa-4086-b991-a5c98e49c4f7

Some embodiments of the invention provide a path-searching method. Light from the optical coupler is then coupled into a light guide. The carrier includes a device for controllable generation of a magnetic field through influence of a control signal to attract at least part of the at least first and second type of samples towards specific locations on the carrier when connected to a first control signal and to repel at least one of the first or second type of samples when connected to a second control signal.

1459828591-c5aef4d9-6deb-4c09-ab6b-34d536e09f97

Biomass based feeds are processed under hydrothermal treatment conditions to produce a hydrocarbon liquid product and a solids portion. A user interface system for presenting medication dosage and treatment information includes a display processor for providing data representing a single display image. At least one wire connection terminal is connected to a secondary winding of the power transformer. A tee head on the other end of the axle is fit into a recess in the outside face of the other but to establish a non-rotative connection.

1459828591-e2a62e85-98df-4251-86a6-91a8c20412ba

The present invention is directed to 6-substituted-thio-2-amino-quinoline derivatives, pharmaceutical compositions containing them and their use in the treatment of Alzheimer's disease, mild cognitive impairment, senility and/or dementia. Aspects of the method may include acquiring an MMI event from an MMI event queue within the MMI wireless framework. Form engine is connected to output device. The common voltage generating circuit provides a common voltage to the common electrode. A surface of the multiple-layer composite lens can comprise a combined progressive structure and substantially constant optical power structure or a cropped progressive structure.

1459828591-f77e9995-c206-4048-bbf1-a22647485170

A phase locked loop with low steady state phase errors utilizes a delay unit to delay an input signal or a reference clock so as to lower the steady state phase errors of the PLL. The heated sensing surface is constrained to have a wettable area much larger than the area of the cooled sensing surface. Specifically, a laser beam emitted from laser source is converted into an incoherent rectilinear light beam diverging in a certain direction by the rectilinear light beam generating device, and the rectilinear light beam is projected on a sample via a beam deflecting device so as to scan a surface of the sample. By forming the interlocking features as integral parts of the guide track and drain member this prevents leakage in weakening in the areas where fastening devices would otherwise need to be attached. The edge areas of the active region are thereby protected from thermal damage during electrostatic discharges.

1459828592-0846adcd-235f-4bcf-ace1-d9498c8c7346

Technique for calibration of a frequency converter for reducing a leakage-based non-direct-current component at an output of the frequency converter. The system includes a fluid delivery conduit having a distal end fitted with a nozzle that discharges fluid in a 360 degree arc perpendicular to the direction of the conduit. The connector comprises a locking and rotation-enabling element that is arranged to be activated once a second fluid container has been connected to said second component, and/or once a first fluid container has been connected to the first component, which locking and rotation-enabling element enables the first component and the second component to rotate freely with respect to one another.

1459828592-96b40f6c-ed38-4995-9e35-6e3ea719192f

A device for processing a data stream originating from a device generating matrices

of  $N_l$  rows by  $N_c$  columns of data includes  $K$  computation tiles and interconnection means for transferring the data stream between the computation tiles. Two cams, having openings for the spindle, bush pin and fastening bolt, are aligned with the bracket bores. The method also includes receiving buffer control header with a data packet of a second stream. The covering layer is placed around an outlet opening of the nozzle hole. In other aspects, an electrical module includes at least one of these electrical connectors. A condition of the value document is determined for the condition value using a preset criterion.

1459828592-ef8bb30b-7b67-4bab-b9b2-66fd7e8ad9a7

A wire grid polarizer for polarizing an incident light beam, comprising a substrate having a first surface and a second surface ; and a first array of parallel, elongated wires disposed on the first surface. The motor unit is configured to rotate an output shaft in first and second opposite rotational directions. Substitutionally doped Si-containing films may be selectively deposited onto the crystalline surfaces of mixed substrates by introducing an etchant gas during deposition. First and second light emitting devices emit respective first and second lights in a direction substantially parallel to the linear cutting path.

1459828593-5783a75a-5cb4-4c3f-b56b-704cfb6b6751

A transparent or partially transparent polymer packet is described containing a hand sanitizing fluid in which floats a printed insert. The macro cell comprises the base station device and at least one radio transmitter device that is communicatively coupled to and remote from the base station device. Moreover, the machine includes a half-split type mandrel, vertically provided on these support members, comprising mandrel half portions, with each outer peripheral surface thereof being in contact with the inner surface of the opening. Likewise, a null activation of the pressure sensor positioned in a lit footfall portion generates a second signal to the microprocessor.

1459828593-9334c19d-7fd7-438d-89be-70da2236358a

The invention relates to a process for recovering Group VIB metals from a catalyst, in particular a spent bulk catalyst, comprising one or more Group VIB metals and one or more Group VIII metals. The counters are controlled by control signals from a control logic circuitry of the countertimer circuit, where at least some of the control signals are dependent on event signals generated by an event generation module of the countertimer circuit. A second end of the arm is pivotally connected to a first end of a link, and a second end of the link is eccentrically pivotably connected to the wheel.

1459828593-fb8262da-98a6-4ffa-926e-3bd454a816b6

A method of offloading data is provided by a UE. The up-sampled image is converted into a multi-level image with a second resolution lower than the first resolution with an image processing circuit. A particular encoding scheme may be selected based on information received from a network entity that is separate from the communication system, a user associated with the communication system, a remote communication system with which communications are established, or a combination thereof. Co-culture of neuronal cells with cells to be tested for infection with a TSE agent also provides a high throughput method for identifying infected cells. This driver command is only detected when the pedal position or a desired value derived therefrom exceeds a pregiven threshold value and when the gradient of the pedal position or the desired value derived therefrom exceeds a pregiven threshold value.

1459828594-133bfc40-1dfd-43f6-b4ad-edfc9d887769

A position measuring apparatus which measures positions of first and second marks. A servo controller for track following on a tape uses a digital filter implementation of the matched filter to produce a filtered servo signal. The plurality of candidate images is transformed based on the reference image. The

receivers are coupled with the display elements and receive transmitted image information.

1459828594-aef4b226-7f98-4f7f-84fa-57d5c037780d

A double inlet centrifugal fan includes an impeller and fan inlet port. Air and fuel vapor flows through a mixing tube and an Omega recuperator to a combustion chamber and heats IR emitters spaced from TPV cells. An upper surface of a through plug is retreated to a lower level than an interface between the silicon substrate and the insulative thick film, thus to define a height gap. Two blocks extend from the rotatable member and a plate is mounted on the annular flange. The energy delivery circuitry is configured to deliver the cardiac stimulation therapy. The intermediary drive roller assembly includes: an intermediary idler roller mounted on an intermediary idler shaft; and an intermediary drive roller having a gripping surface engaged with the intermediary idler roller.

1459828594-ec1f1c93-280d-499f-9719-d6172a21f402

A method of enhancing the productivity of a subterranean formation penetrated by a gas, oil or geothermal well consists of introducing into the formation and/or well a pumpable polymerizable fluid comprising a crosslinkable, monofunctional alkene, multi-functional alkene, a heat inducible free radical initiator and brine. The diaphragm is mounted between the first and second bodies. The bushing assembly includes an elastomeric element.

1459828595-4a025666-38bd-423f-a758-ba3023df1de1

A plastic container is provided. Light emitted from a light source bulb is reflected by a reflector to form an outward beam. In a second conversion operation, the AD conversion unit compares the analog value with a second reference voltage and outputs a comparison result as second converted data. Efficacy may vary from patient-to-patient. Another embodiment comprises at least one drug, a reservoir for receiving the drug, and at least one of a coating and a membrane closing the reservoir, wherein one of a material for the reservoir and a material for the coating or membrane is made from a shape memory material and wherein the shape memory material, after triggering the shape memory effect, controls the rate of release of the drug. The wireless communicator can use carrier-to-interference ratio measurements and sector load information for each of its Active Set sectors ) to determine the best serving sector.

1459828595-5c05237d-17b3-4078-9c9c-7b8f4fd9a1ca

The present invention provides a method and apparatus for controlling the pressure of an actuating fluid flowing through an inching clutch. The stencil includes a carrier strip, which carries an identification code or symbology. 0 to 10 mm and into which optical waveguides are introduced. Specifically, a video codec structure such as H. If a device determines that it is compatible with the seed device and is thus able to share its resources with the seed device, and vice versa, the device can decide whether to join the cluster.

1459828595-c5de5454-4467-4427-a95b-e9f5dec8e54

A sequential vibration preventer for a ball hitting implement in which impact vibration that is generated when a ball is hit is transmitted to the human body from the impact generation source via the ball hitting implement. The handle and a portion of the cord are passed through the first loop to form a collar. The closing of the roof area hides the displacement of a first seat in the vehicle by a second seat. In the erroneous pixel removal process, a boundary pixel removal process, a contraction and expansion process, or the like are applied. Then, ink is sucked for each of the three nozzle caps by a suction pump.

1459828596-2af36bc9-0019-4678-bc94-25d67770e288

The present invention relates to liquid-crystalline media comprising self-aligning additives which effect homeotropic alignment of the LC media at a surface or the

cell walls of a liquid-crystal display. The first joining surface is attached to the housing and the second joining surface is attached to at least one optical element of any one of a first optical system and a second optical system. The CPU communicates with the second GPU via the second-GPU bus after receiving a signal indicating the timing of the data communication. There is a cutting tool rotatably contained within the bore of the sleeve. A zener diode is used to clamp the VBL at a voltage higher than the set point of the controller to ensure that the controller operates with a 0% duty cycle output while in a no-load condition.

1459828596-4ca64e48-097b-440f-9a45-0ed36a655f4d

One embodiment of a retractable marine fitting includes a housing positioned within a marine hull, the housing adapted to receive a fitting therein, and a fitting including an elongate body movable between an extended position substantially outwardly of the housing and a retracted position substantially inwardly of the housing. A number of discrete posts span the slot between pressure and suction sidewall portions. In a preferred embodiment a plurality of IC memory chips are mounted on one side of the flexible substrate and one or more logic chips to the other. A signal analyzer is located in the casing and is connected to the telescoping antenna.

1459828596-8135f29b-c0d4-4d95-b8eb-2be51aded3cb

A portable ozonation apparatus for storing and purifying liquids includes a container having an opening for receiving a liquid and a treatment cap. The coating therein consists of a non-vaporizing getter metal alloy for an inner wall of a high-vacuum vessel. The first steering element is positioned to steer a beam from the laser. The arithmetic means acquires at least one characteristic value possessed by a waveform corresponding to one unit of a training action which waveform is included in the displacement detected in the detection unit on a time axis, for each waveform, and to evaluate the acquired characteristic values for at least one of variation, transition tendency, and deviation from a predetermined value. The switch valve switches the open state and the closed state of the low-pressure return passage.

1459828597-30752aa1-3dc1-4b45-9843-8b051b15960b

A method for reducing a size of an image of a class file is provided. In one embodiment, an actual speed of a vehicle involved in an accident may be estimated. The carrier body is slidably received within the device housing for movement between an advanced position and a retracted position. The resilient tab is outwardly displaced by the sloped surface to expand the top opening of the indicator to allow the indicator to pass over the flange.

1459828597-42b54a85-d5e1-4829-919c-fb636cdc7078

In a method for transferring a product in a packaging machine, the product is engaged from behind by a pushing element which is mounted on and driven by a first circulating continuous conveyor and moved from a transfer station along a sliding surface for transfer to an ongoing conveyor device. The first and second strips are not exposed until the package is initially opened, and are not interlocked with one another until the package is initially opened and then reclosed. The fastening component is connected to the other housing part and to the handle, and a vibration reduction element is arranged between the fastening component and the handle. Control terminals of the first and the second switch are connected to a word line.

1459828597-459327a7-743d-4a5d-9eba-6b7410c77bf6

Semiconductor devices are provided such as, ferroelectric transistors and floating gate transistors, that include an epitaxial perovskitedoped strontium titanate structure formed above a surface of a semiconductor substrate. In this operation, if a user ID is designated, transmitted image data and information related to transmission is transferred to the LAN to notify the information to a user corresponding to the user ID. Thus, when a burglar employs an electric drill to

break and unlock a lock by drilling through the keyhole of the lock, the steel balls in the recessed holes can stop the electric drill from drilling forward, having excellent effect of anti-theft.

1459828597-7a2963f8-149d-4110-9024-9cdadc984c05

A blower system for livestock may include a housing. The system may include a sensor, sensor terminal, and data collection unit. The receiving queue manager transmits a synchronous write of the transaction message to a remote queue manager associated with a remote disaster recovery computer to safe store the transaction message before it can be operated upon by the transaction processing computer.

1459828598-8dc12f77-2fb2-4adc-8a36-dc2d6a63a43e

In datacenter environments, many copies of servicing components are used to handle larger loads. Typically, the main route for the transosseous core approach traverses through a more-accessible bone of the joint which can be aligned with a less-accessible bone of the joint in order to facilitate treatment of articular surfaces and/or other structures in the joint. The phase of the commutation controller is re-initialized based on the timing data on the disk, thereby compensating for a cumulative phase error when driving the commutation sequence based on the timing data on the disk. In phase one, a compound that reverses the effect of the anticoagulant is added to the first portion and a clot is allowed to form. Also, the stepping motor rotates backwards. Specifically, the insulating ceramic base is located between the solid electrolyte body and the heating element, thereby ensuring a desired degree of electric insulation between the heating element and the reference electrode.

1459828598-cc0a1122-1fbd-4590-9a21-0ebbe8151d66

An improved tilt-type aerosol valve for use with a pressurized whipped cream dispenser. The radiation therapy wire is similar in size, shape, and flexibility to the conventional guide wire used for the angioplasty procedure, and is introduced using the same catheter to carry out the radiation therapy procedure. The metal has a surface hardness above 50 Rc to reduce the risk that the metal will deform under the coating and leave the coating unsupported. The buses of one layer are connected to the appropriate bus of the other layer using through-holes located in the array. The layouts include features having a print-compatible shape and an orientation that is either orthogonal or parallel to the orientation of every other feature in the layout. The water-based amine curing agent may be used as part of a two component coating system in the curing of modified or unmodified liquid or pre-dispersed curable resin.

1459828598-e6079b29-ecbe-4d79-8fe8-f68bc045b941

Methods and computer readable media are provided for creating a dialing string. In operation the gauge is compressed, placed around each tension rod and released. The compositions may be used to prepare fried foods such as donuts. In an adjusting action, a usage of the motor is adjusted when the input passes a threshold related to a motor performance parameter. After the mold is filled with a dry-cast concrete mixture a top plate, having mold top wall formations, is disposed over the mold forming side walls with the mold top wall formations disposed inside respective ones of the molds to close the molds.

1459828599-4c142abc-a160-49e8-87f1-a583b898e4cb

A piston for an internal combustion engine has a lower piston part and an upper piston part disposed on the lower piston part. Digital scale and passenger ticketboarding pass scanner are used to acquire the weight and location data, which can be fed to a processor to process the data to determine appropriate weight and balance for each flight and/or transmit data to other systems to be included in their determination of vehicle weight and weight distribution/balance. The notification indicates that the second device can be supplied with a second power using the first set of conductors and a second set of conductors out of the

plurality of conductors, and can also specify the configuration for enabling the second power.

1459828599-6b22f34d-7e6f-4989-be4c-9ecb4512e533

An electrical circuit includes a multilayer printed circuit board and a housing which shields against electromagnetic interference. It may be desirable to allow the user to view various aspects of a measurement system at various levels of granularity. Responsive to determining that the effective data rate is materially different than the current operating frequency, a subsequent negotiation is performed to establish a modified operating frequency where the modified operating frequency is closer to the effective data rate than the initial operating frequency. In an indirect communication mode, the printing device communicates indirectly with the other device. In some embodiments, two shuttles are provided for loading and unloading the plasma processing system. Hangers, embedded in a structural ceiling, that support the beams, are insulated from the beams by the noise dampers.

1459828599-80838ed6-0be5-4cc1-bdac-21ad47ff097e

A method performed by a mobile communication unit when operating in stand-by mode in a wireless cellular communication network. The polishing pad with a plurality of grooves is provided. The water reservoir has a bottom and a side surface constituting a surface of revolution around a longitudinal axis of the reservoir, the reservoir having an outlet port formed at the bottom thereof along the longitudinal axis, for the withdrawal of water from the reservoir, and a circulation inlet port formed in the side surface. The outlet passage may be positioned to communicate steam from the wheel, through the interior of the rotor, and to the exterior of the rotor. The system and method provides an external retainer having supports for receiving at least one artificial compression body and securing at least one artificial compression body in a supported relationship to facilitate reducing load on the one or more natural disks of a patient.

1459828601-28998694-dc05-4e65-90f4-bf9ffeea4e3b

A heartbeat measuring device has a measurement unit that measures a heart rate of a user, and an information storage unit that stores unique information regarding a heart rate unique to the user or information regarding a detected heartbeat of the user. Cutting elements and methods of use are disclosed. A member-receiving passageway 29 is formed on each of the connectors 25 and extends generally perpendicularly to the elongated member 12 upon which the connector 25 is disposed. Actions also include selecting functions based on proximity within a device.

1459828601-3a16ed03-69a0-44d7-b160-a42db859290a

Embodiments are described for a brightness enhancement method, system and apparatus for low power architecture. In response to snooping a transaction on the interconnect, each agent outputs a snoop response. The first tier covering and the second tier covering are coupled to the frame so that an overlapping area exists between the first tier covering and the second tier covering. A first sealing member is provided for engaging the fuel rail outlet and sealing the fuel injector inlet opening from a portion of the fuel injector body. The method for the system including a light source, a detector configured to receive signals from the light source, a transducer that reads signals from a magnetic tape and a plurality of structures coupled to the transducer and configured to pass in opposition to the detector.

1459828601-5f380bb7-9858-433b-aeb3-cbb15ed236b8

A system for applying pressure relief valves to packaging from a liner carrying adhesive backed pressure relief valves passing over a series of rollers in tension onto a peeler bar. A first interface receives a data access request from an application, and a prefetcher reads metadata associated with a file and uses the

metadata to identify further data to be prefetched and placed in storage or memory having a performance greater than the performance of persistent storage. The detonation wave is directed around the first waveshaper surface toward a second tapered waveshaper surface. Compared with a centralized virtualization solution, this solution can significantly reduce management data overhead and thus enhance the real-time behavior of the whole system. The saddle fin transistor of the present invention has a structure in which a landing plug contact region, particularly, a landing plug contact region on an isolation layer is elevated such that the landing plug contact SAC fail can be prevented.

1459828601-6748135a-6368-4e9a-8503-98d084c3d45b

An electric device includes a housing having an indicator window and a visual indicator adapted to emit a visible light signal through the indicator window for indicating a status of the device. The correlation matrix is approximated to a good degree by a circulation matrix that is diagonalized by FFT operations, thus substituting two FFTs and one IFFT having a complexity of  $O(3+2\log^2 N)$  for the direct matrix inversion having a complexity of  $O(N^3)$ . The tubular grip element is axially-slidable for being axially advanced to extend over, and fixedly engage, an outer surface portion of the nut, simultaneously with axial compression of the connector over an end of a coaxial cable.

1459828602-3b959a92-2275-4af4-955c-6d38c85bc1a5

A method of operating a portable composite communication terminal the functions as both a portable phone and a camera. The BLUEBAY-BMP pollution-trap provides advantage of community-tailored filtering stages, the preferred embodiment setting forth a convenient user-friendly prefabricated-kit assembly employing a basic build-in-place containment-housing which can be readily adapted to the studied needs of a given community, without incurring alteration of existing sewer-stormdrains. At least one active element is formed on the body. The method is adapted to test and verifying different power states of the computer system, including Standby, Hibernate, Shutdown, and Reboot, and can be executed without being limited by any computer-specific hardware. These slits and the flat surface or the concave portion are arranged symmetrically in a section of the collector core.

1459828602-ddae07cb-0cf4-4501-b8ec-d970ea783f35

Systems and methods of controlling automatic transmission fluid in a vehicle include torque converter systems generally having a pump, a turbine and a stator. The doser is mounted in a tangential orientation relative to a point defined at an intersection of a doser axis with a theoretical cylinder that surrounds a center axis of the mixer and is defined by a variable radius. A metallic face sheet is secured onto at least one outer face, adding structural rigidity to the multilayer printed wiring board.

1459828602-fa8b3f85-52fd-4119-9600-5fc116aa0f01

An exemplary liquid crystal display device includes a liquid crystal display panel, and a flexible printed circuit joined to the liquid crystal display panel. The engine control apparatus is capable of operating the work vehicle with the importance placed either on amount of work or fuel economy depending on the situation, and preventing the input of excessive traveling horsepower, regardless of a selected work mode, to ensure durability of the traveling power train. An XML processor at the central monitoring system converts the XML document contents and applies them to a standard interface which has previously been available directly to fully conforming components. In response to determining that the data contains the at least one signature, a log is updated. The antimicrobial compounds are of the formula I: wherein R3 and R4 are as defined herein. The deposited film is subjected to a first stage of chemical mechanical polishing with a relatively high rotation speed and a relatively low pressure, so as to eliminate an initial level

difference formed in the deposited film due to the groove.

1459828603-68c39f0e-6d49-4d95-bd4a-d030aec9b0c0

A thermoplastic molding composition suitable for producing article having excellent flame proofing and improved stress cracking resistance is disclosed. The mobile station implements the persistent packet data control channel by mapping the persistent packet data control channel to a packet associated control channel when a packet associated control channel is available and to a virtual associated control channel when a packet associated control channel is not available. Further, information about a projection screen is displayed on an operation display panel during execution of picture projection according to the operation procedure. Particular embodiments of the guide include a flat portion attached to the front of the cutting tool, or alternately, a laser guide rotatably fixed to the front of the cutting tool. An extension CPU is mounted on the sub board through the opening from a rear face side of the main board. The size of the modules are designed to be transported using standard hauling trucks and moved with skid loaders or fork lifts.

1459828603-bc7f22f5-b65c-4d26-8b93-84ced7066d6b

A method of determining the attitude of a spinning spacecraft is provided. The support substrate is then removed from the molded structure to expose the side of the semiconductor dies with the terminals, and a metal redistribution layer is formed on the molded structure and in direct contact with the terminals of the semiconductor dies and the molding compound. The invention further relates to a medical device comprising said adhesive composition. For a right circular cylinder-shaped gain medium crystal, the apparatus includes a first silicon-based manifold, a second silicon-based manifold, and first and second conduit elements coupled between the first and second manifolds. The processor assigns at least some of the deposit portions to at least some of the unaffiliated banks for deposit therein.

1459828604-2f4f51ce-36a4-4722-a7f6-dcb6c96b10d7

A real-time music request system is provided for use with editing tools for the editing of video productions. The archwire, in an as-manufactured condition, has a portion of substantial arcuate extent, which is canted relative to the occlusal plane. The drive train may include a coupling to the housing and, in an embodiment, the coupling may comprise a ratchet coupling. The reactants may be hydrophobic or hydrophilic and present as fluids, solids or combinations of solid and fluids. The locking pin is biased toward engagement with the locking detent such that when the lever is pivoted to the locked position, the locking detent aligns with the locking pin permitting the second end to engage the locking detent.

1459828604-603da745-228e-4917-a1e0-111e2b1eb46e

Techniques are used to store information in a medium such as the memory cells of an integrated circuit, and also retrieval of information from the medium. The invention comprises gripping jaws and a wedge that moves along angled groove between the gripping jaws. This comprises identifying, for an antenna having excessive subcarriers allocated thereto, the subcarriers allocated thereto and reallocating one of said subcarriers as required, said reallocated subcarrier being selected for reallocation on the basis of its impact on transmission performance. When pressurized air flows into the lower air valve, the lower air valve determines that the air go to one of the two towers linked to the other tower by an equalizing slot, causing a difference in air pressure between the two towers. The reference resistance is connected to one of the inputs and the DUT is connected to the other input. In an example, the identified attribute is an indication of the popularity of the content element, such that the protection mechanism is selected as a function of the popularity of the content element.

1459828604-bc958d8f-279e-41f4-ba9d-3947c054bf31

Described are computer-based methods and apparatuses, including computer program

products, for scalable seamless digital video stream splicing. Also provided is a control unit for calculating the fluid level in the container based on the capacitance of the upper and lower capacitors and a dielectric constant of the fluid in the container. In another aspect of the present application, the AlGaIn region is formed by an epitaxial layer overgrowth process. The pulse oximeter may include a processor configured to execute H<sub>u</sub>221e filtering algorithms to estimate physiological data without requiring the variances and/or distributions of measurement and process noise in the signal.

1459828604-d48839eb-24ea-40c2-8623-8d4211ec369c

A dialysis system which does not need to use a physiological saline in replenishing a solution or cleaning and priming the dialysis system, does not need a troublesome setting operation and can easily and accurately set a flow rate of a replenisher solution. The controller is connected to the storage mediums and is arranged to control Input/Output access to the storage mediums. According to the invention, increase of ON current is realized and a circuit operating at high speed can be obtained.

1459828604-ff9650e4-0eae-47cf-816b-14fab3197f87

A method of motivating players to return to a casino includes receiving a request to convert a predetermined value of casino currency to cash. The warnings are filtered to remove bogus warnings, by using constraints from synchronization primitives and invariants that are derived by performing one or more dataflow analysis methods for concurrent programs. The respective means are controlled based on prescription information to attach and detach the rewrite card to and from the side of the carrier. This causes separation in the separation layer by also using the action of the separation acceleration ions. Received data is simultaneously processed to extract synthetic aperture radar images and moving target indication detections. Without the adapter, a sloped plate on the L-shaped member provides added support when a seat, such as when a bucket-type, is employed.

1459828605-4286ba9a-5538-42b2-b2b0-1582f271415d

A problem in conventional electrical color deviation correction is that an awkward step is generated at a border where a pixel is offset by one-pixel-basis correction. The system comprises a robotic device and a remote control mechanism. Other aspects relate to methods of generating a diagnosis, advice, and/or other information. The amplification product is then analyzed by, for example, size fractionation, nucleotide sequencing or. A novel context selection method is used which treats color components and coefficients of different positions differently.

1459828605-5c1a91a4-aa39-4ac4-9207-8f00fefc81b4

A MEMS transducer has a micromechanical sensing structure and a package. The apparatus also includes \u201c\u201d and \u201c\u201d switches, each being disposed at either side of the base member, such that the \u201c\u201d and \u201c\u201d switches are selectively operated according to the movement of the shift-lever. Typically, the polymer has a hydration product of greater than 22,000. The tissue contacting surface of the staple cartridge may be tapered or stepped. The scan matrix controller is further arranged to test each of said matrices according to instructions in the instruction register by applying a test signal to the tested part of the circuitry.

1459828606-1379d43d-62d3-4a4f-9b58-e99629083f2e

Homogeneous preparations of IL-28A, IL-28B, and IL-29 have been produced by mutating one or more of the cysteine residues in the polynucleotide sequences encoding the mature proteins. The source entity includes descriptive text. The printing can be accomplished, for example, using a thermo-print head of the electronic reading device in connection with a thermal sensitive paper. Furthermore, the front surface of the IO integrated circuit is electrically coupled to a top surface of the optical integrated circuit, where the top surface of the

optical integrated circuit faces the front surface of the IO integrated circuit.

1459828606-3c6f0a70-efbf-4f02-9b56-84b74ec66ac9

A dirt collecting system for a vacuum cleaner includes a dirt cup formed with a coarse particle separation chamber and a fine particle separation chamber separated by an apertured wall. Provided herein are alkoxy derivative compounds and pharmaceutical compositions comprising these compounds. A filter member is integral with the assembly and positioned at one end of the pouch. The occluder portions are conjoined at least one point on each portion.

1459828606-42e8f893-cabc-4d3c-ada1-f5d3a4d7daf8

A cleaning tube into which an endoscope is inserted for cleaning is formed with a flexible tube and curled like a loop. If the disk access range contains a defective sector, the CPU suspends disk access when a head has reached the defective sector. The first plate includes a first side, a second side, and a substantially convex surface extending therebetween. A chrominance variation value can be acquired by comparing the chrominance signals of the two adjacent images. A plug poly is formed on the active region between the word lines. CPU of the apparatus controls the apparatus in such a manner that applications of operation members in a current operation condition of the apparatus are effected according to the defining information.

1459828606-ae4486be-03a6-4406-aa81-2eb6ee643b09

A display apparatus comprises a plurality of display panels and a time controller electrically coupled to each of the display panels respectively. The system limits the display of the linear content by determining a time to automatically change the display of the linear content based upon program guide information and other factors, unless a signal is or has been received from a user indicating further interest in the content. Height of the lamination packs is controlled by interrupting the application of glue for certain laminations so that between some of the laminations that are stacked for assembling a lamination pack there is no glue. In addition, the number of sustains corresponding to the rearranged sub-fields are generated.

1459828607-1a3ed204-40e0-4853-84ea-6114abf64074

Electronic transaction data sets are processed for a multitude of disparate transactions using a plurality of autonomous payment networks. In an embodiment, the vias may be formed using a lithographic operation also utilized to form electrically conductive lines in a first electrode layer of the cross-point memory array device. At least either of the oxidizing gas and the reducing gas is jetted into an upstream region S1, a middle region S2 and a downstream region S3, with respect to the flowing direction of the gas, of a processing space S containing the workpieces W.

1459828607-1b52da04-a412-416d-8881-43b9a7ab5227

A method for designing a system on a target device utilizing field programmable gate arrays includes synthesizing a design for the system. The injection port includes a housing, a fluid reservoir defined in part by the housing, a needle penetrable septum, and a tissue in-growth promoting surface integrally provided on an exterior surface of the port. The inclined surfaces are inclined so that the distance falls within a tolerance even if temperature of the object and the plurality of holding members change. The first passivation layer is etched to form contact holes therein to expose a source structure and a drain structure of the transistor.

1459828607-9720c054-3476-48fe-939e-61ede74701f8

Articles of footwear and footwear systems include modules, e. The filter holder housing has at least one concave structure having an upper entrance, a lateral wall having a lower end, an upper bearing zone extending from the lower end of the

lateral wall, and a retaining threshold disposed between the upper bearing zone and the lateral wall. Methods for producing a maize plant that comprises crossing hybrid maize variety X00A034 with another maize plant. The titanium dioxide pigment of the present invention has characteristics peculiar to anatase type, for example, optical characteristics such as bluish color tone and physical characteristics such as low hardness, and furthermore has high opacity which is not possessed by conventional anatase type titanium oxide pigments. The mesh structure includes a layer of flexible dielectric having a first side and a second side, a screen-printed pattern of flexible electrically conductive first circuit lines forming a first resistor network on the first side, and a photo lithographically-formed pattern of flexible electrically conductive second circuit lines forming a second resistor network on the second side.

1459828608-40ae1e14-aac4-4c4a-8d1c-67d5cbb7935b

The invention relates to a coding apparatus for embedding second data into first data without deterioration of the first data, and a decoding apparatus for decoding the coded data to the original first data and the second data without deterioration. A general expression of the codes is described, as well as a systematic criterion for proving correctness and finding decoding algorithms for values of  $m \leq 2673$ . A recording apparatus has laser beam driving circuit means, signal generation means, and signal transmission means for achieving the above recording method. The error in the cellular oscillator may be measured from the AFC operation in the cellular portion of the device. A PC-based power combining and waveguide structure can be constructed in the same or a surrounding structure to combine and guide the shifted radiation to an antenna or exit aperture. The relative angle of rotation of a pivoting inductor assembly is alternately articulated by front and rear guides located within the main housing.

1459828608-fafe8cb2-0247-4e1d-ad7e-975fd9819a58

System and method for providing an interactive collaborative display for sharing electronic data in an educational environment. The device includes a trigger switching module, a firing mode selecting module, a control module, a power module and a motor module. The plasma-generating substrate has one or more flow paths for an exhaust gas. Thereby, the intake pressure can be detected to a high degree of accuracy in a two-cycle engine, for example, which has a relatively low intake negative pressure, while achieving cost reductions. In other embodiments, the mark can be used to monitor aberrations of a lens in an optical photolithography system.

1459828609-51b60907-e348-46ee-af8c-1e3fb56cba9d

An exemplary elevator system includes a first controller configured to recognize a hall call signal that indicates a passenger's desire to board an elevator car at a particular landing. The performance parameters can be correlated to maximum operating frequency of electronic components of the electronic system for the particular age of the electronic system. Each of the fiber optic strands includes a single optical fiber or a plurality of optical fibers to form a bundle. By merging a plurality of SDCs into a single most pessimistic SDC, designers are able to ensure that the device will properly operate in all the defined operational modes. In another embodiment, the present invention is a semiconductor memory device including a memory array comprising a plurality of semiconductor dynamic random access memory cells arranged in a matrix of rows and columns.

1459828609-697687fd-4d19-4bee-9470-043b037ab969

An endoscope has a first bending portion, a second bending portion, and a hand-held unit. The etching composition is particularly useful for the fabrication of semiconductor devices. An apparatus generates a visual representation of the area of interest on the surface of the article. A third angle deviation computation unit computes a deviation between an output value from the differential coefficient multiplication unit and the detected rotation angle of the valve driving motor.

1459828609-c98b205c-c459-4938-b753-70040f1b617f

In some embodiments related to a memory array, a sense amplifier uses a first power supply, e. In certain embodiments, methods of making low-color ester compositions from a biorefinery bottoms stream are disclosed. The synchronization manager uses this timing information to determine an earliest available media stream output time common to each media stream output device, and synchronizes the output of the media streams by providing each stream to its associated output device at the earliest available common output time. The strap is proximate the base member and the clamp member and has at least one strap-fastener orifice.

1459828609-fc153a3f-de9c-4b62-bd71-843daa10553d

A method for distinguishing recipients of electronic communication on a data processing system utilizing the recipient's electronic addresses. By coordinated rotation and delivery of disks taken from a linear disk storage bin, both sides of a dual-sided optical disk can be automatically accessed. In particular, the compositions and methods provide a more sugar-like temporal profile, including sweetness onset and sweetness linger, and/or a more sugar-like flavor profile, including osmotic taste. Then, if this set includes at least one uplink component carrier comprising an uplink shared channel, one of these at least one uplink component carrier comprising an uplink shared channel is selected for transmission of uplink control information in that uplink shared channel. Each lip seal includes a seal portion disposed to seal the orifices in the presences of liquid. The apparatus comprises a first and a second control unit, four serial buses for performing serial data communication between the both control units, two pull-up operation units for continuing control voltage of the serial buses at a certain level, and a control voltage matching unit for continuing voltage equilibrium condition.

1459828610-1477b471-4bb1-4cb7-a1f7-c99a7a7d2219

An apparatus and method for controlling a compressor are provided. In a medium that records/plays back data including video data and control information, the control information includes information for accessing a specific portion of the video data. The sheet may be fixed in the extended position or may be selectively retractable and extendable. Other aspects and embodiments are provided herein. The single analyzer color switch according to an embodiment uses a split-path so that relatively weak colors can follow a \u201chigh-efficiency\u201d path.

1459828610-2fd9392f-7380-4ec4-bfaa-f4c293461712

A vascular impedance measurement instrument includes a transducer to obtain a digitized arterial blood pressure waveform. In one aspect, the method involves removing the existing OPC drum without detaching the end caps and installing a replacement OPC drum without disturbing the end caps. The substrate includes a sensor that is tracked by the surgical navigation system and a positional device that determines the position of an anatomical structure relative to the sensor. The graphical representation of the unstructured data source may be generated using data extracted from a web based document. A report is then received in accordance with the choice.

1459828610-a7440500-9a23-4138-b1ba-030fc2bf7acf

A method and apparatus for determining electrical parameters for commissioning a sensor-less permanent magnet synchronous machine uses knowledge of the rotor position to apply balanced pulses along the rotor magnet axis and perpendicular to the rotor magnet axis allowing measurement of q- and d-inductance at multiple current levels without substantial rotor movement. Each resource server registers, with the OAuth authorization server, metadata for that resource server, indicating scopes that are recognized by the resource server. The apparatus further includes a chamber wall that defines a chamber in fluid communication with the fluid input or output of the pump, with the chamber wall absorbing vibration from the pump when the pump is operated to output fluid at its fluid output. The outer periphery of

the shaft portion except for the connection ribs is arranged within an inner side of an inner periphery of the elastic locking members, such that the locking leg can pass through a mounting hole of a panel without the outer periphery of the shaft portion contacting the inner periphery of the elastic locking members.

1459828611-03ef4ae8-c48f-4864-b0aa-15642267f822

An imaging millimeter wave radar system. The monitoring tool also includes a graphic interface which may be utilized to define and associate performance operational rules of a website being modified or created. A drive mechanism is connected to the slide plate and supported within the plenum, and is operable to translate the slide plate relative to the plenum to convey the acquired sheet while maintaining the vacuum through the apertures. The plurality of pins is interlaced to each other, so that a line along a specific direction will only pass one of the plurality of pins at most.

1459828611-145d133b-0708-4fc1-8a7b-b805feae5cf0

Two byte domain name server system is discloses for obtaining an IP address corresponding to a domain query in a language other than English. An oxide semiconductor layer including a crystal region in which c-axis is aligned in a direction substantially perpendicular to a surface is formed and an oxide insulating layer is formed over and in contact with the oxide semiconductor layer. The control circuit periodically and alternately couples one of the two ends of the solenoid to ground via the output port under the control of the clock signal. Preferably the cards are automatically placed into the melds by an Optimum Expected Value function. The client compares the first map to a second map that corresponds to the application currently installed on the client to determine that one or more data blocks corresponding to the upgraded version of the application are not present in the application currently installed on the client.

1459828611-669971a2-ebe2-4cf0-bc7b-9346b957e564

Methods and apparatus uniquely distinguish one file from another in a file system. The delay circuit section provides a plurality of delay clock signals that are obtained by delaying a clock signal with a different delay amount. The device is mounted to a mirror or window and is positioned such that the heated air flows upwardly across the mirror or window.

1459828612-31d604a4-d846-4f85-9621-b41e8647a044

The rubber-blanket plate comprising a carrier plate on which functional layers are arranged. Further, the reaction is carried out in a solvent system common for the whole reaction sequence and inert to the reactants formed during the process and used in the process and comprises a water immiscible organic solvent and a specified amount of water. One or more frequencies that comprise the tone to be detected by the tone detector are attenuated/removed from the near-end speech present on the send path of the device thereby preventing the near-end speech from talking-off the tone detector.

1459828612-b8ae8ed0-3f4a-4bd7-b458-513ba3528e08

The leak detection device comprises a plurality of measuring cells in whose interior the absorption of a laser beam is influenced by the presence of tracer gas. The priority of the audio streams are defined by a content creator of the application. In some embodiments, each of the first and second wheels can be coupled to the at least one front beam and at least one biasing member can be associated with each of the first and second front wheels. The second focus feature may be focus sensitive or focus insensitive. In some embodiments, the conductive region is selectively enhanced by the aqueous solution. A check valve 16 is inserted between the both syringes, and the check valve 16 works so as to prevent the gel 10 from flowing back to the charging syringe 15.

1459828613-84802111-b38f-4fc8-990b-00be734855bb

Each second electrode formed on a second main surface of a compound semiconductor layer of a light emitting device has an alloyed contact layer disposed contacting the second main surface, aimed at reducing contact resistance with the compound semiconductor layer, and a solder layer connecting the alloyed contact layer to the conductive support. The system includes a rectangular integrally formed resilient frame defining a cavity in which the heatsink is contained. The invention further discloses therapeutic, diagnostic and research methods for diagnosis, treatment, and prevention of disorders involving any one of these novel human nucleic acids and proteins.

1459828613-e53e9966-ce6b-4c9e-ad42-247fc0063c59

An apparatus and process using a high-power, short-pulsed thulium laser to output infrared laser pulses delivered through an optical fiber, for cutting and ablating biological tissue. The compound of the present invention has HIV integrase inhibitory action and is useful as an anti-HIV agent for the prophylaxis or therapy of AIDS. These steps can occur in either order. Preferably, the fuel supply stoppage section selectively sets the specific delay time to a different delay time depending upon the detected operating condition detection, e. A method for determining a physical position of a flight control surface of an aircraft is also disclosed.

1459828613-f8fb46e3-aee2-4dd1-99be-0813837221d9

Oxygen scavenging can lining materials are disclosed. The first to fourth switches are turned on and off by a switch drive circuit so that the period of time in which the first and third switches are on and the period of time in which the second and fourth switches are on alternate. Acceptable elastomeric polymers include, but are not necessarily limited to, styrene-butadiene copolymers. A wire driving member for advancing or retracting the control wire is provided in a control part connected to the proximal end of the insert part.

1459828614-5669f5d5-e33e-4028-9adb-1aae92ed1eb1

For quasi-orthogonal multiplexing in an OFDMA system, multiple sets of traffic channels are defined for each base station. The pursuit block pursues the movements of a target object. The spring component is attached only to one of the first attachment structure and the second attachment structure, and the piston component is attached only to the other of the first attachment structure and the second attachment structure. In one embodiment this frequency control component may vary in proportion to the switching frequency commanded by the hysteretic current control loop. A liquid crystal display device is thereby obtained according to the present invention, in which highly reliable ground connection is realized even when used in an environment subject to frequent vibration. The processor further executes logic configured to constrain the relative location and width of conductors in the integrated circuit.

1459828614-7a419df0-22dc-4b81-9c12-936c0e0f9c23

An aircraft docking system is configured to be located at a docking site. The digital signal processor also includes a programmable network that may be configured to selectively provide connectivity between the memory units, the accelerator units, and the processor core. A first global positioning system generates a first position signal corresponding to a position of the first vehicle.

1459828615-7fb3f593-b7cf-4fdf-b070-4b7d43db1913

A technique of setting powers and shape of beams to allow optical solitons to exist on WDM beams in fibers. At least the contact is composed of a fully silicided material. Therefore, the just-described reflected portion of the probe beam is interfered with a reference beam formed by a portion of probe beam reflected by the front surface of the semiconductor material, and phase and amplitude of the interference signal resulting therefrom are both measured. When there are continuously present a predetermined number of sections or more where a proportion

becomes a predetermined threshold proportion or more, the sections are detected as an MSK modulation mark. Since the liquid of the resist, of a higher fluidity, penetrates in every hole and corner between the adjacent conductive lines, the gap defined between the adjacent conductive lines is fully filled with the insulating material. An electrical connector having a ring is coupled to the body over the post to provide an electric path of conduction.

1459828615-da8db286-3863-46a2-8775-ca79b7037192

Proposed is a method for collecting valuable metal from an ITO scrap including the steps of subjecting the ITO scrap to electrolysis and collecting the result as indium-tin alloy. This low-power local-area network enables sensors on an asset to transmit sensor data to a mobile terminal affixed on the asset. In addition, a solid support for binding with nucleic acid as another embodiment of the above-described solid support, comprises a polypeptide having capability of binding with nucleic acid which is immobilized on the surface of a carrier. Under broadcast control, local computers, combine user information selectively into prior art communications to exhibit personalized mass media programming at video monitors, speakers, printers, etc.

1459828616-53241ead-c448-4b0c-a9c4-bce51ac1b081

The invention relates to processes for preparing 2-aminomethyl-4-cyanothiazole and its salts of the formulae Ia and Ib . A workpiece transfer device for part carriers or workpieces is arranged in the production cell which workpiece transfer device forms a supply position and a delivery position. A fixation mechanism is formed on or integrally with the lead body proximal to the electrode array that is adapted to be implanted in and engage subcutaneous tissue, particularly muscle tissue, to inhibit axial movement of the lead body and dislodgement of the stimulation electrodes.

1459828616-a874435b-07c5-4fb0-97f4-435acf6f8e61

A method and apparatus for selection of one or more ventricular chambers to stimulate for ventricular resynchronization therapy. The user wears a power transmitting unit 303 by hanging it from his/her neck, for example. The dome has a plurality of panels arranged around a perimeter of the dome. The phase shifter is a transmission line element connected to the input signal. Arc voltage measurements can also be used to determine one or more parameter of the welding wire.

1459828617-08030e0b-d573-4796-9a05-d976f93445f0

An apparatus for imaging a tooth having a light source with a first spectral range and a second spectral range. In order to initiate a purchasing session, consisting of one or more purchasing transactions, the purchaser authenticates himself to a home provider computer which then allots an anonymous client identifier to the client for the purposes of that session. For a proper reconstruction of the structure in the volume of the sample it is important that the measurement geometry be known; therefore it is important that the images be properly aligned. Similarly, silence can be modeled using an ergodic HMM model. An average path length is calculated based on at least the first and second path lengths. The air quality containment unit contains dust, molds and other air-borne pollutants using a filter, such as a high-efficiency particulate air filter, to maintain a negative air pressure in the unit.

1459828617-13f791c6-3174-4f5b-a01b-8911313256dc

A physiological measurement system can include a low noise patient cable that connects a monitor and a noninvasive optical sensor. Language constructs allow fine grained access control restrictions to be specified on the access to data in a table at the level of a row, a column or a cell. The no-power optical group includes the wavelength selecting device for making short wavelength light be selectively substantially non-transparent. A determining is made of whether or not the packet originated from the keyboard. The high pressure package is especially

well suited for producing a food product having an effervescent sensory character.

1459828617-70664b53-9a02-4b8f-8cd1-0f1911f37714

A system provides interaction between graphical objects and a managing application by detecting that movement of a first graphical object relative to a second graphical object on the graphical user interface is within a spatial proximity. The method also includes, in the event that the verification agent is able to invoke the verification platform API, performing remote verification of the verification request via the verification platform. The DC continuity component could be either an external component, the power transformer winding, or a device power input DC impedance. The fastening seat has a guiding groove facing the armrest and the guiding groove is formed with toothed portions. The dentition cleaning device is adaptable to water assisted tooth cleaning system and motorized electric teeth cleaning systems.

1459828617-e3facb5a-6820-4109-b9c7-9685c26fca1b

A thermoplastic composition comprises polycarbonate, an impact modifier having a pH of about 3 to about 7, and a flame retardant essentially free of bromine and chlorine. A stepped portion of the lead frame mechanically and electrically interconnects the low-side and high-side lands. The system first captures packets from a transport layer of a network of computer systems, then decodes the packets captured to determine the destination IP address and the source IP address. A lead frame structure may be divided into first and second portions. In this way, the error between the data filtered by the time domain equalizer filter and the data filtered by the target filter may be reduced, so that a shortened channel may be provided. The support structure can include an integrated heat sink in thermal communication with the array of LED emitters.

1459828618-02566286-12c8-4d3a-8575-c294eb8e102b

A vehicle driving operation support apparatus for a vehicle, includes a sensing section to sense a traveling condition of the vehicle including a surrounding condition inclusive of an obstacle around the vehicle, and a control section to calculate a risk potential for the vehicle in accordance with the traveling condition. The retaining pins can be easily screwed in and out of the socket. The buffer is configured for insertion between the femur and tibia so as to at least partially prevent the bones from contacting each other, which reduces the pain and discomfort associated with a loss of articular cartilage. As a result, the yield can be increased. The innerliner rubber composition is comprised of at least one elastomer selected from bromobutyl rubber and chlorobutyl rubber which also contains a dispersion therein of pre-cured diene-based rubber particles.

1459828618-19124d89-ca5c-41b1-9160-db95b6b43264

Process for preparing purified citalopram or one of its salts that comprises the purification of citalopram by selective extractions of citalopram or of its impurities with organic solvents and water under specific conditions of pH and temperature. The cell layout also includes a gate electrode level layout for the entire cell defined to include linear-shaped layout features placed to extend in only a first parallel direction. The polyacrylonitrile is dissolved in the solvent to form a polyacrylonitrile solution.

1459828618-2f0e9460-c6ee-4c91-92f0-8223c1e087f3

The invention relates to a method for obtaining an ammonium carbamate solution from a gas mixture that contains more than 40 wt. Each section has a linear edge defining an axis about which the sections are pivotal. If the distance is greater than a predetermined clearance requirement, a via is placed within the interior of the nearest bottom pad; otherwise, the via is placed exterior to the nearest bottom pad. The model is adjusted, the expected responses are recalculated and the differences are again determined.

1459828618-44c3b826-a757-48e1-935e-060be51e11ad

A semiconducting device with a dual sidewall spacer and method of forming are provided. The peripheral input device includes a computer selector for selecting one of the plurality of data processing systems for interaction with the peripheral input device. A distance from a virtual reference plane to each planar area is adjusted on an area-by-area basis.

1459828618-5564af62-6dbd-480d-860a-c33e7f3fc55a

In a storage system, a storage apparatus has an encryption key generator and an encryption processor that encrypts data to be recorded in a storage region using an encryption key from the encryption key generator, and is able to change an encryption key for each divided region set in the storage region. During operation, the system receives a color profile comprising a lookup table which defines a conversion of color coefficients between a source color space and a destination color space, wherein the source color space includes a black color channel. The grooves in rotor and/or the port opening cross sections in stator and the rotational direction are selected such that fluid flows from grooves under high pressure in the direction of narrow, substantially pressure-free ports are avoided. The plurality of misconnection-proof keys are each inserted with the long arm into a slot formed at a predetermined position between the insulating block and the metal shell until the removal preventing protrusion is fitted in a removal preventing recess or aperture formed in the slot so that the short arm of the key extending outwardly of the slot.

1459828619-8a687b8c-4dc3-4721-a487-85727da0e3e9

A device enclosure includes a clad metal shell having a plurality of mounting structures attached thereto. The device preferably includes a hub and a catheter with the hub having a first port and a second port. Load cam discs, a torsion disc, rolling elements, and a hub cap shell are configured to generate axial force, transmit torque, and manage reaction forces. The digital to analog converter receives a signal from the microprocessor indicating a current value. This jet can also provide stagnation pressure in the exhaust lumen which drives the tissue or thrombotic debris out of the exhaust lumen.

1459828619-bc69eef7-7bdc-44fe-a85a-2ce0b7c36206

Proposed is an apparatus for the spray treatment of printed circuit boards. The ink jet head includes: a nozzle which ejects the ink droplets; an ink chamber which stores ink to be ejected from the nozzle; and a piezoelectric element which causes the ink droplets to be ejected from the nozzle. Provided that the formula for spacing the afocal variator within the optical system is utilized, the afocal variator acts not only to focus the optical system but maintains substantially constant magnification during the translation of focus. If the hardware target is a semiconductor chip, the invention selects the appropriate IP and creates an HDL description of the chip. a non-secure data channel, toward a receiver control module; the sender control module generates authentication data of the first stream of data; the authentication data are transmitted from the sender control module to the receiver control module on a second channel, e.

1459828620-37e531ce-c9ac-4449-b496-fd893ed04360

A system and method are disclosed for ordered execution of actions in a game environment is disclosed. The scraping ring frame portion is disposed to be near the surface of the sphere as to scrape foreign matter on the surface of the sphere. The lid can be joined to a base of a package at a low temperature, thereby reducing vaporization of solder components and adhesion thereof to electronic devices within the package. Thereafter, valve members are opened allowing plastic to be expelled into one or more secondary cavities, or to be expelled back into the machine barrel.

1459828620-433189d4-b81d-42c4-b684-b770c0ccbe37

A dishwashing machine equipped with a washing compartment and with devices for washing dishes using a washing solution also includes a sorption drying device which is connected to the washing compartment in an air-conducting manner and which comprises a sorption column containing reversibly dehydratable material, this sorption column being used for drying the dishes. The assembly includes a locking mechanism and a lap bar pivotally mounted to the locking mechanism via a support shaft. The present invention preferably uses the IEEE-1394b databus due to its unique and specialized low latency, shared bandwidth characteristics. This changes the coupling efficiency between the first optical fiber and the second optical fiber, allowing an adjustment in light power. and the olefin content of the feed is above 25 mole-%, relative to the total feed. The fiber management structures each include channels extending between opposed first and second ends.

1459828620-467f17ff-2bd7-4e15-9377-98f76fa9839a

A formulation which promotes gum and oral health through the presence of natural components exhibiting astringent, antiseptic and local stimulant effects. The multi-touch orientation sensing input device may include a device body that is partially enclosed or completely enclosed by a multi-touch sensor. The cable terminal includes a coupling member that has first and second coupling ends. An inlet port is in fluidic communication with a supply of an aqueous ozone solution to supply the aqueous ozone solution to the conical-shaped surface. In this manner, power management can run more smoothly and efficiently compared to conventional means of power management that ignore data from a scheduler when determining power management policy.

1459828620-55e256e7-051e-4712-984e-61d167454f61

One embodiment of the present invention provides a system that learns a generative model for textual documents. The terminal end may be positioned in the tight gas formation. The invention includes various therapeutic methods and screening methods for identifying antioxidants. The metal plate filled in the opening portion and the upper conductor are joined by plating by using the upper conductor or the lower conductor as electrode.

1459828621-1d5cd8f6-70aa-4317-b2c2-62cb5b1398ef

A combined ceiling fan and light fitting having folding fan blades is provided. Correlation methods for comparing lower-value sequences by first coding to higher value sequences and then calculating a correlation number are also disclosed. 9, and a ratio of a length of the overlapped portion to the length of the floating pattern is 0. The theater seat assembly may further include each one of the seat portion and the back portion having a frame, a cushion disposed adjacent the frame and a trim cover covering the cushion and attached to the frame. This invention further relates to soybean seeds, plants, and plant parts produced by crossing the soybean variety XB10G03 with another soybean variety preferably as part of a breeding program. The invention is also a method of treating molds, comprising the steps of exposing a mold to a high intensity UV radiation for a predetermined time.

1459828621-8e236c9c-9184-4700-923a-445a038a0740

A memory array used in the field of semiconductor technology includes a plurality of memory cells, bit lines, word lines perpendicular to the bit lines, and first/second control lines. The meta information includes information relating to the multimedia content including a content ID and a terminal ID of a terminal that stores the content. The heating element assembly may have a head portion larger than the securement opening, and an electrical resistance heating element comprising a continuous coil.

1459828621-dafe5b60-7ae3-4e7d-9ad3-76544215a181

The present invention relates to a digital data play back apparatus for converting a digital data a signal read from a recording medium by sampling in a clock cycle, equalizing this digital data to a waveform which agrees with a partial response

class on the basis of the clock, and detecting data on the basis of the clock with respect to the equalized signal waveform. The image forming apparatus includes a plurality of developing units. The base station control apparatus includes a handover control section determines a handover base station to be handed over by the mobile terminal from the base stations, and directs the mobile terminal to hand over to the handover base station. Further, significantly all of the at least one composite sourcedrain diffusion region is below a bottom surface of a gate of the PFET.

1459828621-eec52baa-9fb8-478f-bf4a-8f89f37a63a3

The present invention relates to methods and systems for providing printing services over a communications network. The methane gas replaces the solid carbon charge material used in prior art sintering methods as the source of gaseous carbon. The electro-therapy can be a pre-programmed anti-tachycardia pacing therapy, a shock therapy, or no therapy at all.

1459828622-2ec7d03c-e5d0-405a-8cda-f1087ab023ae

Calibration of a sensor circuit that includes a sensor, a temperature measurement circuit and a signal processing path. An interface transfers the evaluation signals of the sensors to the control electronics of the transmission actuator. Instructions stored in the memory implement a method of determining whether a current power allocation grant for a flow on the access terminal has been received from the access network. Furthermore, voice models in the voice recognition device are modified by the set-up device. A channel voltage boosting of each of the channels is determined according to data loaded in adjacent page buffers.

1459828623-13e4103c-1111-47b9-8ed2-f42a5332678a

An electronic apparatus includes terminals, each being based on a specific standard and being used for communicating with an external device. By a simple immunological measuring method, human TS in a sample can be measured with high sensitivity. Intermediate compounds useful in preparing the compounds of Formula I are also disclosed. In one alternative, the method further includes receiving a new task priority for the first task, assigning the new task priority to the first task and assigning the new task priority to the at least one sub-task of the first task. Individual substrates, without carriers, may be similarly loaded and/or unloaded from a conveyor.

1459828623-3a8cdbf1-3e3a-47f2-a8ea-a4fed0df26da

A mechanism for securely transmitting credentials to instantiated virtual machines is provided. The fuel is compressed by a pump, and a pressure variable characterizing the fuel pressure is determined. The wax containing the oils is separated from the aromatic-containing solvent and is further processed to separate the waxes and oils.

1459828623-bcea1fd2-01df-4fb5-bede-c509d78eb453

An apparatus for analyzing the amount of gas in a solid sample such as a contained oxygen analyzing apparatus and method utilizing a preliminary reducing furnace which can be connected to an analyzing furnace by a transfer unit. Specifically, a set of lookup keys is selected such that the number of reference fingerprints such that the clumping associated with the associated each of the lookup keys is minimized. There are three flange members 14 provided, two of which are permanently affixed to the screen guard 12 and the third, a removable flange 26 having a captive fastener 28 for the securing and removal of the screen guard 12 from the lip 16 of a heat lamp 18. The mode-expanding layer has a refractive index that is in-between a refractive index of the tapered optical core and a refractive index of the optical cladding layer. The ends of the cells are attached to a holding plate by thermal adhesion or heating and flaring.

1459828623-bf7ccb8f-2696-4997-a638-2c9e17553068

A system and method for modeling of complete tooth, including root and crown, of a patient to facilitate orthodontic treatment are provided, wherein generic tooth modeling is combined with tooth crown modeling for a patient to yield complete tooth modeling. The controller also outputs a command identification signal for identifying command data, to the data line drive circuit through a th data output terminal. The AWR is advantageously designed to be lightweight and to self manage its use of storage space so as to avoid ending up with a repository of performance data that is larger than the database that it is capturing data about. The pair of column sections extend from the rear surface section along the end surfaces on the coil end side of the teeth, while keeping spaces between the column sections and the side surface sections so as not to disturb deformation of the side surface sections. At regular intervals, a new insertion point is placed at the top of the LRU list, and at the tail of the queue. An epitaxial wafer for a field effect transistor comprising a buffer layer 2, an active layer, and a contact layer on a semi-insulating substrate 1 from the bottom, and the buffer layer 2 includes a plurality of layers, and a p-type buffer layer composed of p-type AlxGa1-xAs is provided as a bottom layer 2a.

1459828624-24d47914-ef4c-48d9-b151-d3324aedfd96

The present invention discloses a general access system for access to communication services, such as telecommunication, data communication and distribution of TV and radio. The callback server monitors terminals that have such flags set and is arranged to transmit an alert to the calling party when the called party next becomes available. The guard includes a grip and an opening to provide access for cleaning.

1459828624-2c5b2bf8-2277-40e7-b378-fd2de041e048

There are disclosed a rolling mill capable of keeping a uniform plate of thickness distribution and manufacturing a good-quality plate, and a rolling method. The planetary gearset is connected to the shift element in a detachable manner. The paste can also be used to form the collector lines on the front-side of the solar cell and the emitter electrode on the back-side of the solar cell.

1459828624-4a4ab1ff-fe1b-4e51-ad5c-6282175659fb

The present disclosure provides for a system and method that intensely oxidizes water as it navigates through a system and accurately, controllably neutralizes the oxidation by-products before the water exits the system. The inner housing is secured in the outer housing, and the inner housing is divided into multiple chambers each for receiving one newspaper. The systems includes an input processor for receiving a user entered search information item identifying an object associated with at least one of the hierarchically linked documents.

1459828624-bf1dd729-be74-4847-b54a-278c3fc8cbcb

A household appliance system and method include an appliance control system having a common appliance interface provided on an appliance and a demand side management module connected to the common appliance interface. Further, the phase controlled dimming driver circuitry applies amplitude modulation and pulse width modulation substantially simultaneously to the output current provided to the light source. The portable ultrasound system also includes an ultrasound transducer having a piezoelectric component and a lens component.

1459828624-c56fdd0c-04e1-4640-9a40-e208fc924560

The present invention relates to an image forming apparatus that enables the occurrence of print defects due to a first print start time delay to be eliminated without using a temperature sensor that has a small thermal time constant. Each of the contoured segments includes a contoured portion having a either different or substantially equivalent angular and/or convergent configurations disposed along a length or height of the ankle area. 1 parts by weight of a flow adjuster.

1459828625-017aab6b-9708-4eda-8197-9d9c397d35de

The invention relates to the soybean variety designated A1035869. The arrays of patterns are displayed on a computer display. The switch lever is slid to tilt the lever to an ON position or an OFF position through a sliding operation of the switch lever from the outside.

1459828625-996b358a-8283-4c2b-8b6a-d122f2f0440b

A flexible, flame-retarded, polyurethane foam comprising brominated and/or phosphorous flame retardants and an acid scavenger. Means are mounted to the vehicle for collecting multiple soil probes. Further, the apparatus comprises an envelope tracking path comprising a variable delay module and a power supply module. These large multi-point segments in turn are linked together to create the shorelines for rivers or coastal areas. In order to enhance the digital imaging procedure, the person may be instructed to move to a selected position. Each of the two faces of the open/close plate opens and closes each of the corresponding opening sections that face the respective two faces of the open/close plate.

1459828625-c3d386fd-4ffc-4a81-9c1d-3abd42700c32

Methods and systems are provided for detecting dead tunnels associated with a VPN. The extract comprises alkaloids, coumarins, saccharides, proteins, polysaccharides, glycosides, saponins, tannins, acid, flavonoids and others. An amplifier is connected to receive a first analog signal on an input terminal, the first analog signal being generated by the capacitive transducer, and to generate a second analog signal on an output terminal. Further, the signal is wirelessly sent from the handheld programming device to the communications receiver, and the instruction is transmitted from the communications receiver to a device in the system. The sleeve includes parallel, circumferential rings and grooves utilized as attachment points for mooring ropes. The core region of the optical fiber further comprises multiple sections, each doped with rare earth ions.

1459828626-05c99192-1976-42c6-9f59-0b8c17c5b739

A suppressor grid is configured proximate to an anode to produce a suppressor electric field selected to provide a force on an electron in a direction pointing away from the anode, wherein the suppressor electric field is further selected to pass electrons from the suppressor grid to the anode. The control panel includes a housing defining a recess formed therein. The parasitic capacitor between the gate line and the data line can be reduced. The actuator moves the first and second collars along the output shaft. The flex circuit may be aligned using tooling holes in the flex circuit and substrate.

1459828626-0d68d232-6a6d-4550-aece-2abadb7ca190

According to one embodiment, a magnetic resonance imaging apparatus includes an imaging condition setting unit and an imaging unit. In the event that such relatively reliable AV conduction is not present, mode switching to a DDDR or a DDIR pacing mode while continually biased to mode switch back to atrial-based pacing. The at least one toric element compensates for a tilted folding mirror positioned on a side of the sampling chamber opposite from the emitter and the detector.

1459828626-7dd73b03-9a8d-4d5c-afb7-98c2d84934fa

Biological agents such as secretory cells are encapsulated in a hydrophilic gel made of agarose or collagen-agarose and gelatin sponge-agarose combinations. The absorbent solution is used to deacidize a gaseous effluent. The staircase includes multiple stair elements and a state actuating system. Connection attempt results are obtained by for at least some of the connection attempts, tracking which resulted in success and failure.

1459828627-375cde13-c474-4635-97b3-f9f0561aa398

A protective cover mechanism for a port of electronic device, includes a latching

element and a cover element. Using, among other things, text provided by a user's query, the system undertakes a dynamic search process that includes at least one ordered sequence of searches. On the heat sink plate 14, a work-hardened layer 16 is formed by shot peening. The feedback circuit is connected between the output end and the feedback control end of the switching circuit for controlling a duty cycle of the switching circuit depending on an output current of the output end to keep the output current constant.

1459828627-3e9e0883-633f-42da-b48b-896fbec4d334

A structure and method for fabricating integrated circuits with improved electrical performance. The screw portion includes a retention thread extending at least part of a length of the screw portion and a tip at a first end of the screw portion. Images acquired in the same image importing session are marked as coming from the same conceptual film roll. The initialization cycle of the detailed memory loops and continues until a command is received from the host controller and is immediately available for access. The request for the content is received from a user equipment.

1459828627-43042099-4a9d-4225-8d2a-c2363bbb5ca5

In a conveying cart, a front side wheel for supporting the conveying cart is provided with a travel driving unit, and a rear side wheel for supporting the conveying cart is provided with a travel driving unit. Also included is an organic polymer composition for use in forming a cross-linked organic polymer, comprising a cross-linking compound of Formula, a cross-linking reaction additive and at least one organic polymer. Document ranking is mediated by tags that identify the subject matter addressed by an associated document as the ranking mediators for computing content quality scores values for user and reviewer activity. The movement of the wedges alternately opens and pinches-off a deformable conduit in which the product flows.

1459828627-449966e5-e496-4106-ae94-37415b33df88

A cache memory comprising: 1) a tag array comprising a plurality of tag entry locations that are accessed by R of the M least significant bits of an N-bit received address and stored an address tag comprising the most significant bits of the N-bit received address. The additive is one which increases the \u201csoft phase\u201d of the composition making it possible to produce moldings with improved toughness at low temperatures, without substantially changing the melt volume rate. The one or more manipulated variables may include a nitrogen flow associated with the nitrogen cooling loop in the natural gas liquefaction train. The latching system is adaptable to a vehicle defining a continuous access opening closed by independently openable and closeable doors.

1459828627-58b17be0-2753-420c-a3a7-d678f48512d4

A SAW filter includes a plurality of IDTs arranged on substrate along a SAW propagation direction, and balanced signal terminals connected to an IDT. The generator includes a core and lead wires encapsulated in a dielectric medium to isolate current-bearing components from the motivating fluid, thereby preventing carbon bridging and reducing the explosion hazard when the motivating fluid is a hydrocarbon. Further, the method includes delivering, through the hypervisor, an interrupt from the GPU to an appropriate VM based on inspecting the memory page associated with the work completion by the each of the number of VMs. Next, the system computes a running average of the measured variable across the plurality of specimens.

1459828627-ff58f448-fc73-4cf8-9026-063bd1351c98

The invention relates to a method for protecting data during a self-test of a microcontrollers, in which all of the circuit elements within the microcontroller can be tested, where the course of the self-test cannot be altered via the external pins, and no intermediate results are passed to the outside via the pins. The power

amplifier may be configured to generate an output signal in response to an input signal and a control signal. The wireless communications system can independently determine a second set of serving base station for the call using information known at both the wireless communication system and at the wireless unit before the communication link was severed. The contactor is provided with a spacer that spreads the hollow fibers adjacent an inlet to the shell, thereby permitting liquid flow at desirably high flow rates with acceptable pressure drop through the shell.

1459828628-42e7d148-1ead-4ecc-8e75-822c347cdb52

Methods and systems are provided for improving frame selection in wireless communications networks. The supplemental tailgate assembly is able to provide bed extender, box extender, step assist, roof rack, cargo storage area, and box divider functions. A voltage which is generated across a resistor and has a positive temperature coefficient is determined based not on the power supply voltage but on the power supply voltage, and hence the voltage does not depend on the variation of the power supply voltage. The concentration of the charge transport component in the charge transport layer is at a peak in a region of the charge transport intermediate the first and second surfaces of the charge transport layer.

1459828628-4d4c177b-e1af-43f5-a57b-8d759cc501ab

A provisioning server can provide and interact with a firmware tool on target machines. The system includes a signal supply component that provides electrical and/or data signals to a signal consumption component that utilizes the signal to provide an output. The dynamic quest includes quest tasks and quest rewards, which are provided to a player upon completion of the quest tasks in the game. At least one chemical moiety that prohibits recrystallization of the at least one denatured portion to which the at least one chemical moiety is attached is attached to at least one nucleotide in the at least one denatured portion of the at least one double stranded DNA molecule.

1459828628-777cb858-0849-4e51-b6e8-48672d9963f0

There is described a box or an insert for a box made up of elements, such as cover element and a bottom element both of which are made of molded plastics material and which are hinged to each other means of a hinge. Second ends of the laterally extending conductive elements are structurally and electrically coupled to bond pads on or in an active surface of the first semiconductor die. The first spring loaded spool and the second spring loaded spool are disposed on opposite sides of a common open area. Because the gas room crosses the longitudinal frame and extends in the width direction, an air bubble flow with a wide width forms in the width direction by the single gas room.

1459828629-028f0826-0c20-4a47-b1d4-77441422140b

A miniature PMDC motor 10 has a permanent magnet stator comprising two arcuate ceramic magnets 20 fitted to a can-like housing 11 and circumferentially separated by interdisposed rubber magnets 21 wedging or nipping the ceramic magnets 20 in place within the housing 11 without the use of circumferential magnet stops formed in the side of the housing. The labeling reagents can take the form of cyanine dyes, xanthene dyes, porphyrin dyes, coumarin dyes or composite dyes. Such an angle of approach enables the wheel to grind the annular shoulder of the workpiece simultaneously with grinding the cylindrical portion. The second branch predictor generates branch prediction data at a later time and with higher prediction accuracy.

1459828629-bd9d9b97-4863-471b-9836-2d180aeb549f

Glass is provided so as to have high visible transmission and/or fairly clear or neutral color. The apparatus generates relation class information that defines, in association with the first configuration groups, first one or more message propagation relations. When a relay connected to both the terminals of the diode is turned on, substantially equal amounts of positive ions and negative ions are

generated, and a bacteria removal/disinfection effect can be obtained by emitting these positive ions and negative ions into the air. Said invention also relates to a method for compressing 3D binder with the aid of an organic solvent having a water content less than 45% and to sintered bodies, in particular for moulding or precision mechanical engineering, which are fixed to each other by sintering or glass formation from a fine grained material. The first power supply module supplies power for the handle.

1459828629-d98fa2c4-fe0d-4e9a-84da-61ec15046de1

In one or more embodiments, a flip ahead input, such as a gesture, provides touch users with an ability to easily navigate various websites. An electrically conductive material comprising a plurality of electrically conductive metallic particles and a polymer is applied to a corrosion susceptible region of an assembly having a carbon-reinforced composite and a metal. Next, a lag control signal of the optical drive is detected to record the magnetic-pole cycle value as a magnetic-pole basic value. Sensors are sampled during scanning according a non-uniform function in order to realize a non-uniform sampling scheme in a second dimension.

1459828630-0ae44177-f7ff-48f1-834d-a7ad8e72ce6f

A transmission for a working vehicle equipped with an engine having a horizontal engine output shaft, pair of transaxles for driving right and left drive wheels at variable speeds, and working device comprises a horizontal input shaft, output shaft, first gear train, horizontal PTO shaft, second gear train, PTO clutch and casing. The switched capacitor amplifier of the present disclosure can provide a larger fraction of the charge provided by a power supply and flowing through the amplifier to a capacitive load at the output of the amplifier compared to switched capacitor amplifiers that use single-ended class-A amplifiers. A printing completion monitor monitors reception of a completion report that is sent by the printer when the printer reads the page end information. The communications board is in electrical contact with each of the projections for repeatedly monitoring the status of each projection to detect a break in a projection's integrity. Copolymers of unsubstituted acrylate and substituted acrylate are disclosed as pliable biocompatible materials.

1459828630-5b8f150b-5a0f-4e2a-9ea3-76dce3b0f143

A polyphase electrical machine, in particular, a polyphase generator, includes a stator which features a core body having a circumferential slot pitch, and a winding configuration having a plurality of windings. A method of mounting a cable relative to an opening in a wall is also disclosed. The degree of birefringence and the orientation of the optic axis, which influence the amount of displacement, often vary between workpieces or between loci on the same workpiece.

1459828630-6304509f-c76d-48eb-a8dc-0ec5dc79f35e

An exercise device is described having a motor assembly and an electronic control system including a circuit board and electronic components for controlling the exercise device and the motor power output. In one embodiment, an integrated circuit is disclosed comprising a binary decoder and circuitry operative to perform a non-binary arithmetic operation, wherein a result of the non-binary arithmetic operation is provided as input to the binary decoder. The gelling agent may also be attached to the colorant.

1459828630-c07e0c07-b4bf-42be-badc-2208436259a5

Golf balls containing a core having at least one layer and cover having at least one layer are provided. The method includes forming first and second electrodes on lower and upper surfaces of a wafer comprising a plurality of semiconductor laser arrays having a plurality of laser emission regions, and forming a metal bonding layer on the second electrode of the wafer. A surface of the transparent substrate is formed with a plurality of electrical connection pads, and the chip has a plurality of connecting pads. A processor is operably coupled to the visual display

and touch screen. The user of the cell-phone makes an access to the MFP by short-distance wireless communication to receive the e-mail. The tool may also be thrown away with the used filter.

1459828630-ccda3a06-9bbc-461f-b79a-bd8704ed8500

A technique for attesting a plurality of data processing systems includes generating a logical grouping for a data processing system. The network device stores data and addresses corresponding to the streams in a memory. Such a method may inhibit the misuse of one or more network protocols and/or attacks on protocol servers. A handle end is attached to the extension poles or to the scooping head.

1459828631-412343f3-3c26-4cbe-b1b2-4f76f9c17e39

Described herein are methods of repairing retinal tissue using resorbable tamponade compositions that are heavier than aqueous humor and contain one or more glycosaminoglycans. The system has at least one slave controller for operating a slave power supply to create an AC current between the electrode and workpiece by reversing polarity of the AC current at switching points where the slave controller is operated at second welding parameters in response to second power supply specific parameter signals to the slave controller. The damper is a rotary air damper with components that rotate relative to each other and has air as working medium for the dampening. Stored layouts contain one or more image containers and are identified based on product type and number of layout images input by the user. Then, the control unit reads an impedance value of the fan module. Each of the second plurality of sub-bands is modified to decrypt the previously encrypted information contained in the optical signal.

1459828631-6b4fbc2f-5542-4ce0-8125-3c4a8ec20b52

Methods and systems print a multi-color test pattern using a printing device to create a printed test pattern when the printing device is producing a printing defect. The support may include a drive surface that is a \u201cnet shape\u201d surface, i. The distribution unit also transmits the source operands and the operation code to the latency buffer for storage until the destination operand is retrieved from the L2 cache. The lid is connected to the case through a connecting member to cover the open end of the case. The etch has a material removal rate that is at least 10 times higher for doped silicon dioxide than for undoped silicon dioxide or the semiconductor material.

1459828631-8313b040-1e2f-4d4d-af7f-1da32d291f28

An optical material is inlaid into a supporting substrate, with the top surface of the optical material flush with the top surface of the substrate, wherein the optical element is used to shape a beam of light travelling substantially parallel to the top surface of the substrate, but with the central axis of the beam below the top surface of the substrate. The function control mechanism includes a first ratchet that is mounted to rotate with the drive spindle, a second ratchet that is slidable from a first position to a second position, and a ring controller. The particle-particle interactions are switched by the stimulus, to change the overall material's mechanical properties.

1459828632-b474ce02-b4bf-429b-87de-3c99143a0686

A phase change memory and the method for manufacturing the same are disclosed. Embodiments preferably take into consideration the quality of one or more parties to the transaction and the means by which charges may be rendered to them when making account setup, management, and/or transaction authorization determinations. Minerals are disposed within the gel coating. A second perimeter rim extends from the second beam. A latch assembly is operatively disposed proximate the receiving port and is selectively configurable, dependent on an open or close condition of a lid.

1459828632-d9dfa246-171c-4eb7-801b-48ab1e562e88

A golf club head having a body with a front wall with an opening and a striking plate insert is disclosed herein. The system may also include a cold-plate connected to the cold-rail with the circuit board between the cold-plate and the cold-rail, the cold-plate to remove heat from the circuit board. The reference beam is modulated to shift its frequency. Further provided is a system for producing a wide steel strip with thin slab continuous casting and rolling. Light components that are reflected by the radiation entry surface, etc. Pulsed PECVD eliminates the need for gas actuation and inert purge steps required by atomic layer deposition.

1459828632-f743f3be-5d55-42c0-989a-c67e3613c31f

A test key structure for use in measuring step height includes a substrate, and a pair of test contacts. According to one aspect of the present invention, each of the two-way interactive communication devices is a node in a distributed network, thus the devices can access hypermedia or hierarchic layers of information stored in server devices on the network. This eliminates cleaning and disassembly of the extractor. Other calculations further inform this decision, such as the relative average power consumption. Then, after the resin is cured, a microwave lens is formed.

1459828632-f95d61ef-5352-4762-8cc5-3b44225a0bbb

An RF modulator switch selectively couples a locally generated and conducted RF signal or an antenna RF signal to a broadcast radio receiver. The number of dummy memory cells on a single dummy word line used to drive the dummy bit lines is selected. The liquid crystal display further includes a switching element electrically connected to the pixel electrode for controlling transmission of the data voltage. The computer program product can be installed directly from the manufacturer, through computer readable media, or by downloading.

1459828633-0afdf12a-c2ba-4f5d-a89d-374dfa853fb2

The invention relates to a device for recovering moisture present in the atmosphere. A method for creating X-ray images is also provided. The pivoting mechanism interconnects pivotally the display device and the base. The attachment fixtures or members of the tension bands or members couple to respective ones of the attachment fixtures or members of the compression ring or member. A cylinder is positioned adjacent to the rotation shaft, and a second gear is mounted thereon.

1459828633-46202dba-ac22-4d39-a379-8b864b450338

A navigation system for use in a vehicle receives a GPS signal for having a GPS time data that rolls over at an interval of 19. The sleeve is adapted for releasable engagement to a running tool and has a locking mechanism comprising first and second tubular members and a collet is provided. The present embodiment also recites forming sidewall spacer regions along at least a portion of the sidewalls of the trench. The sensing criteria may comprise a number of fail bits. In this way, certain endnodes may be designated as being able to communicate with only certain other ones of the endnodes.

1459828633-49eb9efd-c710-488a-a941-ac3400bc683a

Embodiments including a system for searching through a database using two or three dimensional data or data derived from the two three dimensional data. As an electrode for radiation 11D is provided, a semiconductor device superior in radiation is provided. These passive infrared sensor clusters define respective left and right overlapping fields of view having the same horizontal elevation with a horizontal spacing being adjustable therebetween. The invention also includes insoluble polysaccharide particles for application to human skin. The encapsulant is formed on the upper surface of the substrate to seal the first chip.

1459828633-e7e9db52-e96b-42e0-b46d-d0a74b669568

When the width of a recording head is greater than the width of a recording medium having a maximum conveyable width, a recorded image corresponding to ejecting ports

in the entire area of the recording head cannot be corrected. The input source address field of the packet header is used to access a lookup table of corresponding source autonomous system labels. The method includes selecting fields of the database that are to be analyzed, ranking the fields in order of pertinence to the quality that is to be measured, fetching values for each record of the database from the fields that are to be analyzed and comparing the fetched values to a standard.

1459828634-0a01578d-38d6-40a5-b9be-b5f9d9535017

A method is used for compensating a boundary of an image, in which each scan line in the image is shifted by a corresponding line shift amount. The network switch can include a plurality of ports that are configured to receive and transmit network traffic. The amplifier does not operate when the first switching element is enabled, and the amplifier operates when the first switching element is disabled, and the amount of phase shift when the input signal is passed through the amplifier and phase shifter is substantially equal to the amount of phase shift when the input signal is passed through the first switching element. A caller enters confidential data into a vendor's IVR using the telephone. 4 times their storage modulus at  $23 \times 10^0$  C.

1459828634-940b3d7e-ecf2-406b-bbcb-d6d469639cc5

A method and system for sending, receiving and managing the exchange of messages between an intranet and multiple external users using a secure server as an intermediary interface for Internet communications. Of particular benefit of the present processes is the selective treating of cat naphthas to remove gums instead of undercutting the overall naphtha pool by lowering the end cutpoints of the cat naphtha fraction. Circular axial perforation is formed in the common base, and a plurality of slots and light guides are installed near a periphery of the common base.

1459828634-e0b3c3a5-7253-43ad-ae7c-9bb9a2ea7c0f

A micro-electromechanical process for fabrication of integrated multi-frequency communication passive components is fused into co-fired ceramics by way of flip chip for fabrication of a low-cost, high-performance, and high-reliability hybrid communication passive component applicable in the frequency range of 0. An image-forming unit forms an image to be transferred onto a recording material. The engine further comprises a valve assembly for operating an exhaust valve associated with each cylinder and a fuel assembly for supplying fuel to each cylinder. A resilient portion of the arrow rest absorbs arrow vibrations to reduce noise and improve arrow flight.

1459828635-7f306b9f-db07-4c29-be72-d6a6064e3809

In a radio communication system, an electronic component for high frequency power amplifier carries out the detection of output level, required for feedback control of the output power of a high frequency power amplification circuit, by current detection. The integrally bladed rotor comprises a plurality of pairs of airfoil blades. ; and at least one inorganic filler selected from the group consisting of chopped strand glass fibers, carbon fibers, wollastonite, talc, mica, kaolin, barium sulfate, calcium carbonate, apatite, sodium phosphate, fluorite, silicon nitride, potassium titanate, and molybdenum disulfide, and wherein the pellet has a length of 1 to 5 mm and a ratio of a cross-sectional major axis to minor axis of 1.

1459828635-d8bd6031-7f41-4f74-91b2-118a56f3043a

An architecture for testing a plurality of circuits on an integrated circuit is described. A first substrate member may have a first and second surface with a first and second substrate connector spaced apart and attached to the first surface and a first and second spacer element spaced apart and attached to said second surface. Also provided are a method of making a fluoropolymer, a method of increasing induction time, and fluoropolymer articles containing curable or cured

fluoropolymer compositions.

1459828635-f3c72726-d05a-4d96-86cc-9b171df256a7

A virtually-addressed local texture memory stores selected regions of a texture for use by a graphics processor. Travel speeds may also be initially estimated using an expected maximum vehicle speed, which may be a maximum speed limit. The BCEs identify the terminal, provide an address allocated thereto for getting access at a gateway, and identify the gateway providing the access. First and second contacts proximate distal ends of the first and second arms, respectively, define at least one second elevation. The iterator thread adds all the precomputed indices to a single queue. The first and second sensing reference voltages are selectively provided as a function of the voltage level of the control signal in which the first and second sensing reference voltages are used to read data of the memory cell array.

1459828635-f7c3c9bd-897e-465d-9b70-f118d409b872

The present invention relates to a color stable thermoplastic composition comprising a copolyester elastomer; and a stabilizer comprising an aromatic amine; and a di-substituted imidazoline, wherein the color lightness of the composition is greater than 50. These novel compounds inhibit the processing of amyloid precursor protein and, more specifically, inhibit the production of A $\beta$ -peptide, thereby acting to prevent the formation of neurological deposits of amyloid protein. Each elevator is assigned to an elevator group, the building is divided into zones, and a changeover floor for changing between the elevator groups is arranged between the zones. Conversely, the front of the housing is shaped to naturally conform to the outer shape of the patient. The Si-containing layer that is preferably a spin-on material can be optimized for thermal and etch resistance without compromising lithographic properties since it is not photosensitive.

1459828636-562b3ba8-ca43-40ac-883c-1099e391a758

An backslide plate is designed for mating engagement in an opening in the outer side face of an in-line skate boot. In the present invention, a network user buys bandwidth to have a fixed capacity level. A removable components list is generated, and the generated removable components list identifies one or more components associated with the one or more removable features. The inner end of the outer winding and the outer end of the inner winding are left un-connected.

1459828636-64870d9a-e225-406d-a535-555ee229850b

A substrate inspection method includes the following steps. Assemblies include a spray drying head attachable to a gas supplier and a liquid sample, such as a standard unit of blood product. The reduction in the amplifier stages reduces the number of inputs to, and dynamic range required from, the summing node that provides input to the quantizer, as well as reducing the power requirements and complexity of the circuit due to the reduced number of amplifiers. Methods of the present invention monitor resonances by deriving a resonance indicator such as an apparent frequency, a gain or error magnitude, or similar criteria tested by values conventionally illustrated on a Bode plot. The assembly further includes a tire having bead regions comprising a ledge portion having a toe, a heel, and at least one circumferentially continuous rib with a peak, wherein the at least one circumferentially continuous rib of the tire extends radially into the at least one circumferentially continuous groove of the wheel rim.

1459828636-822dce37-767a-403c-b620-ae7f49468f44

The field of the invention relates to systems and methods for managing user behavior in online multiuser systems, and more particularly to systems and methods that provide user-based arbitration for online multiuser systems. The wireless network may be a mesh network and the server may be a mesh server. The hinge device has a first and a second arm supporting the hood rotatably to a frame member of the vehicle body and first and second lock plates rotatably supported on the under face

of the hood to hold an active part of the actuator. The lens mapping can be used to calibrate the lens against a standard or against other lenses.

1459828637-c6553461-00a5-453f-8b47-7580d0f77e91

A MEMS may integrate movable MEMS parts, such as mechanical elements, flexible membranes, and sensors, with the low-cost device package, leaving the electronics and signal-processing parts in the integrated circuitry of the semiconductor chip. The process is commercially feasible providing indanyllamine and aminotetralin derivatives in high yield that are useful as intermediates in the production of therapeutically active compounds. A plurality of workpiece seats are arranged on the turntable. induces an expulsion of carbon monoxide to generate pentacene in high yield.

1459828637-d702f7f7-7c8c-4127-826b-e91689c0f5c3

A charged-particle beam emitting device which includes the following configuration devices so that a lowering in the image resolution will be suppressed even if a primary beam is tilted relative to a sample: A device for causing orbit of the primary beam to pass through off-axes of a plurality of lenses, and controlling off-axis orbit of the primary beam. The board is produced by mounting an electronic component supplied from a component feeding device onto the board by means of a component mounting device. The slider has a front surface mounted with a supporting portion supporting two end portions of a rotating shaft.

1459828638-2ed1eb61-6b60-4d68-849d-e3b36795bb37

In the present invention, in a cellular communication system using frames of communication resources in time and/or frequency domain, the communication resources are divided into at least two regions. The methods include controlling the conductor density of wiring levels, adding compensating stressed film layers and disturbing the continuity of stress films with the immediately lower layer. A lock tab is provided on the tab end segment, and a lock channel is provided on the channel end segment for receiving the lock tab. Neutral molecules are injected into the stripper tube, which remove electrons from the incoming negative ion beam.

1459828638-c755643f-d600-4388-b784-24b948c42abf

A saddle lift apparatus is disclosed. These receptors may be used in various assays, such as a transactivation assay to identify novel ligands. These ground contacts are arrayed in the first direction and joined to each other via a joining portion. Also provided are methods of treating a subject having an infectious disease, particularly HIV. The second end is attached to a hole located in the center of a plate that is attached to the vehicle hub assembly through two or more lug bolts. Each encoded symbol is distributed at n-locations about a center of rotational symmetry such that decoding the symbols produces n-representations of the data each comprising a different cyclic shift of the data.

1459828639-54cfa164-ada6-4bf7-8001-8047d8c8c208

The invention relates to conjugated polymers comprising benzo-bis units or derivatives thereof, to methods of their preparation, to novel monomer units used therein, to the use of the polymers in organic electronic devices, and to OE devices comprising the polymers. Multiple scaled iterations facilitate energy savings and power optimized systems, without compromise to data access performance. A second plate of the first storage capacitor is coupled to a first reference voltage, and a second plate of the second tunneling region is coupled to a second reference voltage. The second key is fixable at any selected position on the plug and is lockable with the first key on the housing to fix the angular position of the plug relative to the housing and, thereby, fix the rotational position of the optical fiber angularly of the optic axis. The invention can be embodied in a client unit, thus providing a decentralized distribution of computing jobs and avoiding bottlenecks in the distribution of computing jobs for example in a computing grid. The invention includes optimization of geometric variables,

temperature and pressure set points via use of a pressurized bubbling fluidized bed reactor to convert granular raw sorbents and auto-generated biochar sorbents) into activated, highly dispersed, and ideally sized particles for removing acid gases and toxic metals.

1459828639-9f422b43-05bf-484d-b779-a37128d77663

The error concealment method improves the signal quality in transmission systems. In each of the slots, one of the two part-windings forms a bottom layer at the slot base, and the other part-winding is disposed as a top layer parallel above the bottom layer. The feedback loop is provided for data buffering. The imaging sensor module includes an imaging sensor connected to the substrate and secured to the bottom portion, a substrate spaced from the bottom portion and defining at least one recess therein, and a plurality of passive components received in the at least one recess and wholly disposed below the imaging sensor.

1459828639-c3e1fc94-49ac-407c-98aa-95c7d87da919

The present disclosure relates to a computer-implemented method for electronic design verification. The calibration and correction procedure performs an automatic calibration procedure and gray level linearity procedure. During the period, a correction amount for correcting a positional deviation E is issued. The pivot shaft is situated above an upstream end of a stacking surface of the pivoting tray when the pivoting tray is placed at the document stacking position.

1459828640-48f2b036-f6da-43c1-b5e4-d1c485d5f68e

The invention describes a process and apparatus producing a dense coke fraction from a first particulate coke fraction having a first average density and a first average particle size distribution, stratifying the coke fraction in a density separator into at least two fractions, the at least two fractions comprising a light coke fraction and the dense coke fraction. A shoulder of the guard accommodates the shoulder of the gutter hangers. Anodic aluminum oxide membranes serve as the catalyst substrate. Preferably, the receptacle includes a piercing projection disposed in the receptacle adapted to pierce a seal on a container of tire sealant secured in the receptacle. A DAC generates a bias voltage with a small quantization step, additionally providing a fine granularity of gain control.

1459828640-ae292e98-73fc-490b-92d8-5952244c6e4a

A magnetic stripe card reader for reading a magnetic stripe on a card having at least one track of magnetically stored information stored thereon as a stream of encoded discrete data bits separated by bit times is disclosed. The airgap type etalon includes a fixing block having one flat surface, and a transparent parallel flat plate having parallel flat surfaces formed with an antireflection coating and a reflection augmenting coating thereon, respectively. In particular, by avoiding the related art scheme using the N-sized IFFT, the layered IFFT is executed in a manner of grouping N data symbols into P groups each of which includes Q data symbols.

1459828640-d080caf3-c309-4f54-8ebf-db66f08b699d

An OLED display panel and manufacturing method of the panel are provided in which a terminal electrode is exposed by performing etching with fixed etching conditions without performing step processing. The transfer conveyor forms a segment of a conveyor line. CRS-based time tracking may also be inappropriate to implement in certain communication systems such as a coordinated multipoint system where control and data may arrive from different cells, and therefore, a UE may assume a wrong cell for CRS-based time tracking. In order to further reduce the position error given by a combination of bursts, each burst also can be trimmed and/or written in multiple passes. The package is molded using conventional materials and equipment.

1459828641-21112ab0-72ac-4cb1-8f48-64381397bfee

An infrared scene projector device includes a light emitter and a thermal emitter.

A modeling processor generates a model of the tissue surface using the subset of location data points. A conductor pattern is formed over the first dummy region for optical pattern recognition. A method of switching power to an electrosurgical instrument while avoiding damage to high-energy contacts is also disclosed. A block select signal line extending in the sub row decoder along the second direction is connected with the second signal supply section.

1459828641-5a41bbcd-af89-4753-89ec-37fcfdc66a07

A device for regulated heating of media in a dental handpiece has at least one media line which can be opened via a switch, a heating element associated with the media line, a temperature sensor detecting the temperature of the medium and a regulation circuit which is connected with the temperature sensor and controls the heating element in dependence upon the sensor signals. The combustion chamber wall edge is formed with a profile which blocks or at least inhibits a diffuser effect when a cooling air flow, which is guided axially through the flow passages into the annular spatial area, flows over the combustion chamber wall edge. This provides the user of such exercise equipment with the ability to adjust and readily fine-tune the position of the pulleys for proper biomechanical alignment with the user's body.

1459828641-98e2e96c-0cb0-4973-b6fc-2fe696590151

A baler having pre-compression lid stops and method of operation where stops located on a pre-compression lid prevent rotation of the pre-compression lid into the pre-crush chamber to prevent impingement of a gatherer ram with the pre-compression lid. A housing is provided as a ground conductor path in order to establish conduction between two external conductors in portions of the coaxial cable which are separated by the inserted coaxial capacitor. The probecards can also use thinner interconnector substrates to conform to the planarity of a DUT and may suspend such a substrate by wires attached to a perimeter edge of the substrate to permit the substrate to tilt. The operating point may be expressed in terms of clock counts by factoring in the clock rate of the oscillation controller. The pull bar mounting bracket assembly can be easily removed from one model of the given make of tractor to another model of that tractor make without requiring any modification or customization of the mounting assembly or the tractors.

1459828641-db24e71b-2f54-402c-9855-15747d7bf0bb

For use with a baking pan of the type formed from a sheet having a plurality of frusto-conical depressions and inter-spaces between the depressions, a hole maker. In one aspect, a mixer server receives a request for a visualization of television reporting data, translates the request for the visualization of the television reporting data into sharded requests, and provides each sharded request to a respective shard server. The reference surface includes two or more reference indicators spaced at substantially even intervals from one another. 25 C, and the voltage thereof is 3.

1459828642-5dc1c7d5-2a71-436a-bf34-c1949759a8ac

The present invention provides a system and methods for a radio frequency identification system which securely and conveniently integrates important travel-related applications. The optical recording medium comprises groove information tracks on which information pits carrying information data is to be formed, and prepit tracks provided with a plurality of previously formed land prepits connected to the groove information tracks. Pulses for a display discharge are alternately applied to the X and Y electrode lines to cause a display discharge at the pixels where the wall charges have been formed.

1459828643-10d752ee-3987-4657-817f-23ab3fd8f97b

A transformable catheter includes a sheath having a length which is a substantial fraction of the entire length of the transformable catheter and a bore therethrough. After dialing a telephone number, a contact name and a timestamp in a

service provider database is compared with a contact name and a timestamp in a storage device. In certain embodiments, the compressor-expander comprises one or more stages, each stage consisting of pressure vessel partially filled with water or other liquid. In addition, pharmaceutical and diagnostic compositions are provided comprising any of the aforescribed antibodies, antigens, epitopes, polynucleotides, vectors or cells. Many components of the low pressure EGR system are also usable in a passive EGR system. A method for assembling the rotatable bar pin bushing assembly is also disclosed.

1459828643-13a41f8c-7231-49c6-a5f0-f1b914d1a4cc

Lanyard connectors for release of an ordinance are provided. A customer transacting at a SST during a Self-Service transaction receives in-air tactile communication for assisting the customer during the SS transaction. 5\xd71019cm3 to 3\xd71021cm3 and belongs to group 13 of the periodic table, and the region is a region to which a catalytic element left in the semiconductor film moves. A second rotor assembly is coupled to the outer surface of the cylindrical body and electrically coupled to the first rotor assembly. The glue is positioned so as not to contact the readable surface of the CD or DVD and degrade play. This allows for the formation of a larger wellbore than originally drilled and a wellbore larger than the drill bit diameter.

1459828643-e0340137-8d96-4b6f-98e3-ee30a726ec25

Disclosed is a display device having a pixel electrode and a pixel driving transistor. The method includes providing the WLAN for a user device to access a packet network, where the user device receives requested content transferred over the packet network through the WLAN access point. The said intraluminal device contains appropriate sensors and reports in real time the forces and pressures exerted on it, as well as its position, so that the levitation and the steering can be dynamically adjusted using appropriate dynamic control of external magnetic devices such as solenoids.

1459828643-ecde5138-c4ca-481f-81cf-7635867e854d

Disclosed are methods for inducing polyploidization of megakaryocyte cells and for promoting differentiation of megakaryocyte cells into platelet-producing cells. An electron beam is deflected by passage through a magnetic or electric field to be measured and is allowed to pass through a deflection electrode to thereby be deflected in a direction perpendicular to the magnetic or electric field to be measured. The hydrogen product stream is supplied back to the pipeline. In another embodiment, the user may enter a message or messages for a designated recipient or recipients at any time, and the message is saved and automatically sent when the connection becomes available.

1459828643-ee1c4d29-9d57-40a5-8036-3deea827d997

A portable rolled product containing a small roll of sheets, such as tissues or wet wipes, is particularly useful for uses outside the home. Such an elongate medical device comprises a shaft having a proximal portion and a distal portion, a pull wire disposed in the shaft and affixed to the distal portion of the shaft, and a handle coupled with the proximal portion of the catheter shaft. A steadying rest, for use on machine tools to hold a workpiece, especially one having a longitudinal central axis that is rotationally unsymmetrical or unstable with respect to the machining tool, in position to enable measurement of the shape defining parameters and shape deviations while the workpiece is mounted on the machine tool, is also disclosed. The reverse link transmitter stops channel transmission on the reverse link in response to the transmission control signal. Ends of the noise insulating wall are respectively connected to an inside surface of the arc-shaped part such that at least one portion of the noise insulating wall is foldable between the two base parts.

1459828644-010acc26-aab6-4248-b7db-fd65a335236e

In a granular magnetic recording layer of a perpendicular magnetic recording medium, media noises are reduced by separating adequately magnetic crystal grains and non-magnetic grain boundary and decreasing magnetic exchange interactions among the magnetic crystal grains without causing damage to magnetic anisotropy of the magnetic crystal grains. The housing is pivotally connected to the support via a pivot shaft and is pivotable between an operational position in which the radiation emission plane is horizontal, and a rest position in which the radiation emission plane vertical with a single rotation of the pivot shaft about a pivot axis extending through the pivot shaft. The truck contact includes a first group of guides that cooperate with a second group of guides on a truck charging contact and a third group of guides on a truck operation clamp. The gateway further comprises an interface for making the extracted data and/or formatted data available as packet data network data at a PDN output port of the gateway.

1459828644-30937ad8-6999-4c6e-874c-af7f7f3349ad

A method and a device for forming an image upon a medium using toner is provided. To start inflation, the apparatus couples a fluid source to the object via a plenum. With this, it becomes possible to reduce such work as discarding the card due to the issue cancellation or replacing a pasteboard due to the address change required after the card is produced.

1459828644-8d968445-0157-48fa-9e8a-79e408226ee2

The present invention discloses a latency counter applied to a memory, for delaying a memory accessing control signal. The modifiable portion is attributable to the one entity and remaining content in the displayable content container is not editable by the users. The system also includes an identification component, which operates to identify a maximum monitored level of actual utilization. The signal to be measured is fed to a bank of delay elements, each with a slightly different delay with the difference in delay between the first and the last being more than D. The source of light preferably uses stable, long-life, white LEDs, in which case white-balancing of the remitted spectrum can be accomplished by pre-determining and storing the spectrum of the LEDs, one time for all, and then adjusting the remitted spectrum accordingly to compensate for deviations of the LED spectrum from the constant ideal. For each output message, an indicator is associated with the output message indicating whether this output message is the last message being generated for the given input message.

1459828644-c08376fb-2220-4be3-8201-dfad8f781522

A retaining device is designed to retain a portion of an assembly device. However, the adhesive strength of solder balls to ball pads is low, so that the adhesion tends to be unstable. The pool of assets may include real estate, automobiles, major electronics, major appliances, artwork, etc. Each of the faceted search results is displayed in association with user interface elements for including or excluding the faceted search result as additional search terms to subsequently refine the search query.

1459828644-d5f712ea-a27b-4032-9b57-657d4918bb74

The present invention provides a printed circuit board which is capable of air-tightly sealing a functional surface of a device and of preventing excessive stress from acting on the device itself or a conductive bump conjugating the device with a wiring board and a method of fabricating the printed circuit board. An imaging element converts a subject image formed image data. The methods and apparatus further include determining that the counter value meets or exceeds a first barring threshold value within a cell barring evaluation time duration. The BMC reads the binary data stored in the storage chip and defines the binary data as virtual sensor data, which conform with threshold type data, and decodes the virtual sensor data to POST codes and controls a display unit to display the POST codes.

1459828645-3435d929-5ae2-41d0-8a4e-efb1e39b24f4

According to the present invention, a method for preparing tetrazole methanesulfonic acid salts comprises an acylation reaction using a novel 4-iodine-4H-chromene-2-carbothionic acid S-benzothiazole-2-yl ester. In an exemplary embodiment, the drive includes a first engine drive pulley and a second starter drive pulley. The lateral flow devices measure relative rates of capillary flow down converging arms of a common element of porous media in which at least one of the arms has been modified by the addition of flow-modifying agents which affect the flow rate in response to the concentration of the analyte. Also, the method determines if a creation of the new session would exceed a permitted usage of the communication network, and the permitted usage corresponds to the account. A cutability ratio is the first cutability divided by the second cutability and a contact stress ratio is the first contact stress divided by the second contact stress.

1459828645-72778885-b15f-4c8c-89e1-03c886de4609

A communication network comprises a first gateway, a second gateway, a soft switch, and an end device. The LNBF comprises a PCB, a dielectric resonator oscillator, a chamber, a tuning screw, and a cover. A heuristic may be applied to the input to insert multiple cut points. A user interface is provided which has a list of the recorded television signals and the user can select for playback any of the listed recorded television signals. The end flow cap includes at least one channel for directing the propellant from the spiral flow passage to the outlet. A default document processing device subset is thereafter selected from the available document processing devices based upon the determined location.

1459828646-06307589-f25e-4c55-b9c7-604ad5eaaaf21

A pre-emphasis circuitry that includes a pre-emphasis voltage variation compensation engine having a transition detection circuit and a compensation driver coupled to the PVVC engine is described. The panel comprises on its outer surface a colored film that includes a coloring matter or pigment for color-selective absorption of light rays and fine or micro-particles with electricity-resistant property for letting the pigment scatter or disperse. Such peptides or other molecules may be employed for prophylactic and therapeutic applications in TNF associated diseases.

1459828646-3e4ffc31-2d97-4a28-9efa-dbaf3155fb0d

The present invention is a spray cooling thermal management device that cools an electronic component. The chromogenic amino acid is flanked by at least one amino acid to the N and C termini thereof. In a mounted position the inner filter is arranged to be substantially fully inserted into the outer filter. The client system adds information from the access control list to a data request sent to the storage server system.

1459828646-8743aaab-583d-4750-97a5-127c50c18b4b

A network node is configured for hosting a plurality of connectivity supervision sessions towards a plurality of router interfaces in a communication system. The method comprises determining an angle of pitch orientation of the image capture device, and setting the image capture device to the one of the plurality of operational modes if the angle of pitch orientation is within a predetermined angle range associated with the one of the plurality of operational modes. The user portion comprises a receiver, a position locator, a processor, a memory storage area, and an output device. The rear end of the housing includes a blade sleeve into which the blade of a hockey stick may be inserted and retained. This packaging device and method is favorable for storing or transporting objects which are sensitive to or would benefit from low moisture/humidity conditions.

1459828646-997eb847-fc1c-4162-902f-1d23072a6956

The present invention relates to propylene based copolymers and to processes for producing propylene based copolymers, particularly propylene-ethylene copolymers.

The liquid crystal display device includes a first portion where display is performed by transmission of light and a second portion where display is performed by reflection of light. The unit electrodes for the first electrode group are set so that the area of the electrode surface is smaller than the area of the sandwiched surface of the frozen material. The first data port is capable of being connected to an external electronic device. In one embodiment, the retainer is a shoring clamp assembly including a pair of ring clamps that are secured onto a split end of the flexible conduit and transfer the longitudinal forces applied to the conduit during the slitting operation to an adjacent structure such as a pit wall, thereby holding the conduit taut during the slitting operation. The PTT sends a notification of the user account identities and the unique identifiers to the PMT and returns a status for the training requirements for the user accounts.

1459828646-c65bde34-df79-4f00-b9f3-7c6ff398d8dd

A gutter and sheeting material holding device comprises an elongated body having a bottom wall, and side walls extending from opposed sides of the bottom wall. During vertical blanking intervals of the analog display signal, the ADC circuitry is calibrated. The control device 13 carries out a temperature feedback charge with a quantity function of a temperature as a target value.

1459828646-dadc5e4c-ec58-4cdb-8f62-e02eb8bca90d

A power situation indicator configured to provide power information in a rotorcraft is presented. This invention mainly contains an oil-valve switch device, a driving device, and an electrostatic detection and control device. The invention also relates to methods for producing a barley plant containing in its genetic material one or more transgenes and to the transgenic barley plants and plant parts produced by those methods. Also, the variable clock generator is configured to maintain an average frequency over specific periods of time for the range of discrete frequencies. manual flossing, a flossing type tool, a dental scaler, or a dental explorer.

1459828647-3043e4ec-890b-429b-a551-6d0057bf2b2b

Method and apparatus for the conversion or generation of a video signal intended to be displayed on an image display with different luminance response times for rise and fall. A global data store is synchronized with real-time communication data, such as presence, status, unread messages, and unread notifications, from each applicationprovider. An envelope detector 119 generates an envelope signal having components identical to envelope components included in the original signal. The sensing fibers can be arrayed in a planar arrangement, or in a bundle. The predefined carrier information indicates predicted availability or reliability of each of a plurality of channels to the carrier. The planar sheet is foldable around a plurality of joints or hinges that are configured to fold two ways, thereby allowing the sheet to assume the two configurations.

1459828647-6569927d-f73e-4188-9aea-c77416c5a559

Disclosed is a pupil detection device capable improving the pupil detection accuracy even if a detection target image is a low-resolution image. This invention also relates to inbred maize lines derived from inbred maize line PH4GP, to methods for producing other inbred maize lines derived from inbred maize line PH4GP and to the inbred maize lines derived by the use of those methods. After the separation, a pixel position where the monospaced line is located is filled with color information of an adjacent surface. The listener may play back grouped songs based on the similarities between songs. An image-enhancing material is contained relative to the marker member in a manner such that the imaging material does not directly contact the biological substance; such imaging material will remain self-contained without causing significant tissue absorption, toxicity or undesired image distortion.

1459828648-33bbf1dd-f8d4-4907-8e6f-78eba5d785b4

Disclosed is a skin treatment device for personal use. The interlock prevents forward and rearward mobility of vehicles unless the platform lift is stowed. The capacitor is embedded in the interlayer insulating layers so that the second main surface faces the core board. According to the invention, the operation of protected channels in conjunction with restarting is ensured by starting the protected channels on the channels defined for them in the new composition and on the channels to which they were transferred in conjunction with the protection switch-over. A second central net is woven inside the inner lower ring parallels the first central net sharing a majority of common selvage.

1459828648-54f4b7cd-ca2b-4d8a-afd9-960a1a07b5b9

A method and a system for automated testing of a graphic-based programming tool. The hypertext documents include selection criteria for groups of codesets stored in a central database of codesets. Communications path abstraction units 24a and 24b carry out abstraction of communications paths 26a and 26b in the process of transmission of various pieces of control information and data via the communications paths 26a and 26b across a process boundary or a network boundary. The heat shrinkable coating is formed from an elongated tube of polytetrafluoroethylene, and the distal primary coil is formed from one or more nickel titanium alloy strands or wires, one or more platinum wires, or a combination. The apparatus includes legs that may be removed and stored within the case containing the apparatus. The method supports extendibility to larger systems and may support enhanced power management through frequency adjustments at the core level.

1459828648-5fb79b8e-6ac8-49d3-a519-92ea06246184

In an optical information recordingreproducing apparatus using holography, there are provided the optical information recordingreproducing apparatus, method thereof, and optical information recording medium which correct a zero point and variation of unit quantity of a reference beam angle between apparatus and perform recording or reproducing operation with high compatibility between apparatus. Apparatus may require a user to push and lift in a coordinated manner to effectively overcome inertia and rolling resistance. The FSO receiver provides this information to the FSO transmitter that transmitted the FSO signal so that the FSO transmitter can adjust the direction it is pointing. Under the control of controller the receiver distinguishes received program segments by a segment identifier so that redundant segments captured in capture memory are then stored in buffer memory from which the segments can be retrieved and decompressed in data compressor for immediate or subsequent viewing. Note that the valve may include a second sealing portion, offset from the first sealing portion, to seal the chamber at the opening when the valve is inserted the second distance. A difference generating module generates a difference code word based on the new data drive.

1459828648-81cac3d3-24eb-40cf-988e-62dce74cb6ab

Method for the transmission and reproduction of image data in which image data are transmitted to a communication terminal and reproduced the current viewing direction of the communication terminal's user being determined. The motherboard has a first heat generating device mounted thereon. One or more clips can be secured to a bone plate through a variety of means, including a snap configuration, a screw configuration, and a bendable prong configuration.

1459828649-00fe17c5-cab2-490f-b690-70886f0a76bb

Disclosed is a method of removing hormone from a liquid, the method comprising contacting the liquid with a filter comprising activated carbon fibers. The method includes operating the device in a first mode; receiving an indication of a first person in the presence of the user; retrieving a first profile associated with the first person; and operating the device in a second mode based, at least in part, on the first profile. Included are mechanisms to fasten and remove the anchored sling from underwear and to stabilize and/or anchor the sling when retrofitted to

conventional underwear. Then, an output optical signal output from the optical waveguide structure is supplied to an optical filter to thereby remove a small-chirp component from the output optical signal. They are embodied to prevent the selector element from falling out of the needle body in both lateral directions.

1459828649-85c122cd-37e1-4566-8e65-f6c2a414ecc8

A multi-level contraband detection system. As read tracks become very narrow, this field can drastically reduce the strength of the output signal. The present invention also relates to a process for making a photoexcitable storage phosphor and a process for recording and reproducing an image. Also described are new optical system designs and applications using such double-sided aspheric elements, thereby providing significant improvement over currently available optical systems. Then the image related data generator receives the update data from the update data server. The second portion includes a spring biased member biasing the trim element.

1459828650-01f63fca-f529-47ce-b911-d1429f09127b

An integrated circuit includes a core circuit and a buffer circuit. A plurality of reflective devices are attached to the fibers whereby when the colorization pellet is combined with a plastic molding compound during an injection molding process to form a part, the formed part has a metallic appearance. The turning force application mechanism applies a turning force to a vehicle. The connection electrode is formed at the same time as formation of a pixel electrode and a common electrode using a low-resistance metal, which contributes to the reduction in manufacturing process of the liquid crystal display device. In the corresponding method for marking copper-clad laminates a laser beam is expanded, and the expanded laser beam is focused on the surface of a workpiece in the form of a copper-clad laminate, with the laser intensity inside laser resonator being controlled by a screen.

1459828650-96782f39-8589-4911-878e-d9a70007ae91

A method is disclosed for controlling an output impedance of an electronic device of the type having an impedance control terminal to which an external load is to be connected such that a predetermined value of the voltage at the impedance control terminal controls the output impedance of the device. A battery charger is used to delivering DC current through the coil from an AC electrical outlet so that by positioning the body tissue to be treated within the electrically-conductive band and delivering DC current through the coil, the body tissue positioned within the band is exposed to the electromagnetic field induced within the interior opening of the band. The one set of leads are inserted through the opening, placed in position, and integrated with the support body via a resin block filling the opening. The detectors are co-locatable at the manipulation site with the manipulating instrument and may be removable attached to manipulating instrument. The mixing module mixes the first digital signal and the third digital signal to output a mixed signal. The photoconductor includes an electroconductive substrate; an intermediate layer located overlying the electroconductive substrate; and a photosensitive layer located overlying the intermediate layer.

1459828650-ce6f171e-1499-4df6-9c5c-6b49c2543895

A positioning system includes: a terminal apparatus and an information supply apparatus capable of communicating with the terminal apparatus. Accordingly when the flag is attached in this manner and the motor is energized the flag is rotated and appears to wave so that all may observe. The phthalocyanine is mixed into a raw material for an inner glove, or mixed into a raw material of the glove, or mixed into a lubricant for wearing the glove, or mixed into a coating material applied to the inside surface of the glove, or adhered to a filling implanted on the inside surface of the glove. As a result, it is possible to improve, for example, the leakage property of the dielectric film without adversely affecting a device formed on the Si substrate 101. Charging using the B-field occurs when the IPG is at a

relatively short distance from the base station, while charging using the E-field occurs at longer distances.

1459828650-fc0e3dc2-fe97-4d55-861f-9ff2f79b7216

A method for enhancing temporary solder ball connection comprises the application of thermal energy to the solder balls, heating them to a submelting temperature, whereby the compression force required to connect all balls in a BGA is achieved at much reduced force, avoiding damage to the package, insert, substrate and support apparatus. The server provides a service website. When a receiver receives information transmitted in response to the request, the received information is stored in a memory, and at an arbitrary time thereafter, the information in the memory is read by a recording/reproducing section, and is outputted and reproduced to the user from an input/output section. Water is surely prevented from entering the internal combustion engine and can minimize an increase in the manufacturing cost and simplify the maintenance work of the internal combustion engine. , pressure in the range of 2 to 20 kg/cm<sup>2</sup> in presence of added quantity of steam for formation of a mesophase carbonaceous structure which on steam stripping and cooling forms a solid crystalline coke suitable for manufacturing of graphite electrode of large diameter having coefficient of thermal expansion lower than 1. The tri-bar elements are rotated to three positions, each of the three positions exposing a different outer surface so that three different signature management treatments can be exposed.

1459828651-b288cde7-0263-49d7-bda4-604b30b7bbff

A pump apparatus configured with a first pump for pumping working fluid in accordance with a reciprocation of a piston using a space between a first open/close valve for suction and a second open/close valve for discharge as a pump chamber. The method initially identifies the files to be skipped. A resistance wire is interposed between the transistor cell elements to isolate each transistor cell element. The crown member and bone anchor are loaded into the lower opening of the receiver member, and the retaining member fits around the bone anchor and into the groove in the receiver member. The method and system identify relationships among constituent parts of a wafer fabrication system by generating a presentation of at least one relationship between an identified at least one integral part associated with the wafer fabrication system and at least one other integral part associated with the wafer fabrication system. Accordingly, using the humidification system of the invention, it is possible to provide the same level of humidification performance as the existing humidification system, manufacture the humidification system at low cost, and solve various problems such as a flooding phenomenon of a fuel cell stack and an increase in load on an air blower.

1459828651-dda40aae-6649-4889-940b-be497aa28c7e

A hybrid transmission device for a hybrid powertrain system having an integrated torque machine to transfer power among an input member, the torque machine and an output member in one of a plurality of fixed gear and continuously variable states is operative in a plurality of fixed gear states, a continuously variable state, and a torque machine state. The shaft of the milling cutter is arranged to be supported in an upright orientation such that the shaft extends through a surface of the body of ice into the body of ice. The first transistor is optimized to a first operating voltage by varying a physical property of the first gate, varying a first tub doping profile, or varying a first source/drain doping profile. Push button, solenoid and push key activation of a lock releasing lever releases the door lock so as to return the door lock to the open position. A source region is disposed in the body region, has the first conductivity, and is contiguous with the sidewall. The at least two channel impulse response estimators include an on-time estimator and at least one of an early estimator and a late estimator.

1459828652-09faa31a-eb5a-457b-837e-55ef6021584a

A lancing device integrated with a sensing strip and method of making and using the

same are provided. The device comprises measurement means connected to the communication link, which are arranged to subject a degraded speech signal  $s$  to an objective measurement technique for measuring a perceptual quality of means are arranged for producing a quality signal which represents an estimated value concerning the talking quality degradation. In addition, a pool of supplemental subcarriers is available for use by any user terminal.

1459828652-1c29df1b-563d-4983-8d00-49db038be6be

Embodiments of optical discs and methods for making the same are disclosed. The absorbers are fixed to the base sheet through respective fixing points in such a design that the shape of each absorber is not deformed upon stretch of the base sheet. A first peripheral component interconnection port is provided on an upper portion of said first side, an industry standard architecture port having a plurality of terminals on two ends thereof is provided on the lower portion of the second side by soldering so as to form a terminal-less region on the first side. The test data generator generates test data that is to be synchronized to the internal clock signal, using the outputted test pattern data based on a first or a second control signal. A servo motor rotates the rotating plate. The present invention also provides compositions comprising, methods for using, and methods for preparing Compound of Formula I.

1459828652-89b67f29-0bfe-4a41-aec5-f6bbe1c48c21

A recording signal beam and a recording reference beam are irradiated onto a first surface of a holographic recording medium to write an information as an interference pattern therein. The housing accommodates the rod lens array, the light module and the sensor board. Another method includes the access point setting its packet age limit according to feedback from the associated client station and/or according to information determined at the access point about the network. The bottom edge of the adjustment seat is formed, with multiple downward extending parallel cleaning pins respectively corresponding to the sprinkling holes.

1459828652-cd98b57e-ae75-45a4-a944-77e6e3be7bea

An aqueous ink comprising water, a water-soluble organic solvent and at least two pigments. A method includes receiving precoding information and applying precoding matrix at the sender based on the precoding information. A cavity portion is formed between the chuck top and the base portion of the support body. The housing 1 is allowed to be inserted into the mounting hole under the condition that the pawl is directed to a specific orientation, and, after insertion, is turned through a specific angle.

1459828652-f515bcc1-0751-41d0-80b8-7d8163a0d41d

A photograph is printed with a normal image and data that is not visible to the unaided human eye. The input tray has a support surface, at least one media guide and an over-center device. The bias circuit has transistors connected in a feedback circuit which tends to oscillate to affect the amplifier operation. 3D modeling of the manufactured sample stator bars are compared to the nominal 3D models to insure accuracy.

1459828653-04330deb-8c08-49ad-b9a6-d99e22628fa5

A star-branched polyester polyol is obtained by polymerizing lactide or lactic acid, using, as an initiator, a fat and oil composed mainly of a triacylglycerol that has at least three hydroxyl groups or epoxy groups in its molecule. The dc power capacitor provides with a regulated voltage. Image contamination due to deformation on the belt can be avoided. A working-channel write controller controls every write access to the working-channel signal storage unit, generating a write pulse signal therefor.

1459828653-405e5887-23c9-4da6-b9b5-ff85b351419c

An ear cleaning device is provided for removing debris from an ear. The image-side mask has an aperture with a diameter larger than  $\frac{2}{NA}$ , where  $\lambda$  denotes a wavelength of the illuminating unit and NA denotes a numerical aperture of the to-be-tested optical system. The coarse delay circuit CD comprises a counter for counting a rising edge of the clock signal CKA after receiving activation signal ACT and outputs coarse timing signal CT with delay of  $m \cdot T_1$  measured from a rising edge of the clock signal CKA. A first circuit path is then routed between the first node and the second node, and a second circuit path which protects that first circuit path is routed between the first node and the third node using the pseudo link. In some embodiments the printhead is retained by a rail which is located across the path and along which the printhead slides into and out of a printing position.

1459828653-b3f94e17-d0d3-47a8-acc4-c648fc31cd03

An image reject mixer arrangement 1 comprises a transconductor 2, first and second mixer cores 3 and 4, first and second phase shifters 5 and 6 and a summer or combiner 7. The lidar system includes an optical autocovariance receiver and one or more chemical composition sensors or processors, in addition to a Doppler signal processor for obtaining relative wind speed information. The standoff is brought into contact with an inner surface of the mold plates of a mold tooling when the device is positioned between the mold plates to maintain the flexible tape substrate in a centralized position within a mold chamber and inhibit the tape from bending as a molding compound flows into the chamber during encapsulation. At the time of recognition, the position of each of the characters to be recognized is firstly measured with respect to the position of the printing of the drawing of the background. The body includes a first member and a second member with the seal disposed on the second member.

1459828653-fec0a8a4-8e0b-47f1-b111-dbcd81624502

A method for displaying a starting process of an electronic device is described hereinafter. At least one isolation diaphragm is coupled to the body and positioned in the at least one opening. The shaft portion has an outer surface, and the first annular contact portion and the second annular contact portion are located on the outer surface and respectively surround the axis of the mandrel. Each bit of the secondary signal is represented by a relationship between the polarity of the frame sync signal and the values of the DC control bits in a fashion which complies with the constraints of the modulation code and the DC control algorithm.

1459828654-42b6f848-cf19-4dcf-8e10-06996dbe6fed

A cold-shrinkable element for joining or terminating electric cables, the element comprising a set of insulating or conductive layers, an outer protective sleeve, and a support element enabling said set of layers to be maintained in a radially-expanded state, the support element being suitable for being withdrawn from said assembly so as to allow the layers to shrink onto the cable or cables. The medical device comprises a magnetic field sensing device for outputting a signal in response to sensing a magnetic field. The first bevel gear wheel, and second bevel gear wheel are fixed to the first and second gear shafts via their respective freewheel bearings; and both first and second gear shafts are sections of a single gear shaft. CES modules receive the clock synchronization information and use it to reconstruct a local clock.

1459828654-9c35aca9-cbb8-4c2a-bbf7-67bd330c0219

A digital device 310 with a plurality of collocated wireless networks encounters inter-network interference if the collocated wireless networks operate in a common operating frequency. If the fluid pressure in the first pressurizing chamber becomes higher than the predetermined value, the working fluid can be supplied only from the second pressurizing chamber. A storage unit has a storage area for storing the read units of data read by the reading process unit 62a, 62b. The desired package may be assembled using the assembly sequence. The ticket also includes a

plurality of final hands for the game imprinted on the ticket, wherein each of the plurality of final hands is associated with a corresponding one of the plurality of strategies, and wherein each of the plurality of final hands is normally hidden under a corresponding alterable area.

1459828654-afcb4705-d91f-445a-8406-d53dd0afc20e

Golf balls consisting of a dual core and a dual cover are disclosed. The securement device includes a retainer with a base and at least one post, and at least one cap. For each frequency bin, it is determined whether a portion of the signal within the frequency bin belongs to a narrow band distribution characteristic of the source of narrow band noise located on the console. The engaging portion includes an engagement hole to engage a tool. In a light emitting element, a layer in contact with an electrode serves as a hole generating layer such as an organic compound layer containing a P-type semiconductor or an electron accepting material, a light emitting layer is provided between hole generating layers, an electron generating layer is formed between the hole generation layer on the cathode side and the light emitting layer.

1459828654-c3eb35fb-f374-492a-998b-017b4ebf6961

A battery temperature sensor may include a substrate and a thin film resistive temperature device. The direction of the spiral of the air-cushioning legs is alternated around the periphery of the exercise step to eliminate rotational creep. An electronic circuit card is disposed within the base cavity and is operatively coupled to the magnetic field detectors.

1459828654-f083af6a-5b5d-46e7-82fc-93e2dbb54135

A cathode having a groove extending about 10 to about 450 microns into a surface of the cathode. The computer algorithm iterates over the information stored in the parent CGM file to find associations in stored vectors to determine whether disparate elements, such as segments or arcs, are used to define more complex objects. An indicator component identifies a position of the specified feature relative to the media objects in the sequence.

1459828655-1d4dcdf7-ace5-436d-a159-cbe240952985

A method for reducing oxygen and carbon components in high-purity fluoride such as calcium fluoride and barium fluoride, or in rare-earth fluorides such as ytterbium fluoride and cerium fluoride used for an optical fiber, a coating material, and so on. The fuel cell system may further include a converter, a secondary cell, a battery charger, and a switching unit between the load and the fuel cell. The at least two powder conveying members are disposed on upper and lower sides of the recovery port interposed therebetween in the powder storage container, and are disposed in a longitudinal direction of the powder storage container. An additional step of winding the wire at least once around the antenna template, and a further step of connecting a second portion of each wire to said feedthrough member. The shielding covers include a fixed upper part and a lower part which rotates about the axis with the magnet. The design structure includes a structure which comprises a high-leakage dielectric formed in a divot on each side of a segmented FET comprised of active silicon islands and gate electrodes thereon, and a low-leakage dielectric on the surface of the active silicon islands, adjacent the high-leakage dielectric, wherein the low-leakage dielectric has a lower leakage than the high-leakage dielectric.

1459828655-580df06a-559d-4270-9c3e-5528edb71a0e

A stuffed toy, such as an animal or doll, incorporates a display mechanism. The apparatus includes a receiver configured to receive a transmission of media content, information regarding the content, and information for facilitating a purchase of at least one of a copy of the content, a good, and/or a service. A transformer includes a first winding connected to a conductor on the second end of the cable, a second winding is connected between a ground and the shielding on the

second end of the cable, and a third winding is connected to a current measuring member. An opaque or low visible light transmissivity shield is bent or formed into a generally tubular shape and is inserted into the chamber surrounding the light source. The pump body includes a pump suction port, a pump discharge port a first oil passage for supplying oil from an oil pan to the pump suction port, a second oil passage for returning excess oil of a first regulator to the first oil passage and a third oil passage having an outlet port for returning excess oil of a second regulator to the pump suction port. Lateral branches are doubly occluded, and then severed to isolate the vessel for harvesting and use as a graft conduit.

1459828655-abd92188-d2a3-451b-b062-708b1f883774

A method for determining a slot format of an F-DPCH is disclosed in the present disclosure, including: a Node B using No. \u201d A system is proposed for programming and/or reading non-volatile storage that reduces the effect of program disturb. The plastic strips are installed in the grooves; the coppers are installed in the plastic strips, and they are connected to the power supply. A first uniform-width distance and a second uniform-width distance can be set independently, thereby enabling reducing the second uniform-width distance within such a range that the accuracy in forming the tip portion can be ensured, while increasing the first uniform-width distance within such a range that the overwrite characteristics can be ensured. The preferred method comprises the administration of a specific PGHS-2 inhibiting agent as defined herein. The planetary gear arrangement is disposed in a space that is formed by the concavity of the first drive disk and the opposing region of the second drive disk.

1459828655-e0e1ab0e-cf32-4fb1-9f6c-8f93e9108ed5

Embodiments provide devices, systems and methods for the transdermal delivery of chelated compounds. In one embodiment, the disclosed circuit comprises a first and second dynamically programmable current mirror sub-circuit. The localization members are casted in concrete ring beams. Since the selected workpieces are processed with different job schedules, the equipment can be automatically and remotely driven without manual mechanical manipulation and operator handling. The vertical MOS transistor also has an insulation layer that lines the trench, and a conductive gate region that contacts the insulation layer to fill up the trench.

1459828656-16cdf2c7-ec8a-493e-9149-3e2af9b7d455

This invention relates to a high temperature melting composition and a method of using the composition for brazing high temperature niobium-based substrates, such as niobium-based refractory metal-intermetallic compositions, including but not restricted to niobium-silicide composite alloys. The peripheral edge is comprised of a series of outer surfaces positioned at or beyond a first radial distance from a center point of the valve, and may be in the form of tabs, and an alternating series of inner surfaces positioned at or within a second radial distance from the valve or flange center point, as intervening portions. In particular, the refill container is provided with a coil terminated by one of a number of capacitors.

1459828656-39decdb-1cc5-4753-a1de-9102a3da66ae

A frame has a continuous upper surface with a pair of side-by-side elongate openings for receiving foot pedals. Expression systems for these channels and an assay using the expression systems are also disclosed. The appliance employs an assembly of materials which resists the outward pressure exerted by the veins by retaining its circumference dimensions, and which at the same time stretches longitudinally for comfort and mobility. The set of one or more rules specifies one or more constraints of resources associated with the at least one application framework.

1459828656-3e84a508-650e-4b0c-abdd-034fae263778

A conformal power adapter for insertion into a lighted artificial tree and for converting power received from an external power source to a power usable by the

lighted artificial tree. The controller utilizes a common ground for power circuitry, which energizes the windings of the motor, and the signal circuitry, which controls this energization responsive to signals from one or more sensors. A currently-performed signaling interaction is terminated according to the notification. This initial number of voice channels is within a range in which the queue, based on the desired failure probability, is calculated. This combination of features gives the ball a good, soft feel upon impact and an excellent spin performance that provides increased distance. , an aircraft fuselage at an opening therein.

1459828656-4f6e7a81-91a1-43ac-913e-e712b9d5f011

The method and system of the present invention provides an improved method for asset transition project management. Conductive colored layers functioning as pixel electrodes and color filters are formed by a process of discharging, by an ink jet method, a mixed ink of coloring material and conductive material to the formation area of a pixel electrode to be connected electrically to an active element. The aqueous additive systems of the present invention also provide a great degree of flexibility in preparation of matrix resin blends and formulations. The system ensures that simultaneous green or yellow signals on crossed streets are impossible even though the signals are connected to the same power lines, allowing also the use of a bus connection topology with a command driven control of the ON/OFF state for each individual light or signal.

1459828656-5368f1cc-d6a2-4264-8ab0-8e2af70280e5

Various semiconductor chip reinforcement structures and methods of making the same are disclosed. The system includes an RF interrogator configured for use with dental x-ray, medical imaging, film, and digital radiography apparatus, and may include a multiplicity of RF transponders or interrogators. The composite wave form is decomposed into instances of a discrete wave form, each having reduced noise amplitudes. A contact plate is mounted to a predetermined portion of the head to be brought into electrical contact with a corresponding one of the contact terminals.

1459828657-06e584c9-8e7e-430f-90b1-b88459985f7f

The invention provides a golf ball material which is a resin mixture composed of an olefin-unsaturated carboxylic acid copolymer and/or an olefin-unsaturated carboxylic acid-unsaturated carboxylic acid ester copolymer having a weight-average molecular weight of from 120,000 to 200,000 and a weight-average molecular weight to number-average molecular weight ratio of from 4. The transmitted signal includes, over a symbol time, a series of direct successive modulated pulses which propagate along a direct propagation path and secondary pulses which are associated with each direct pulse and which each propagate along a secondary propagation path. A second node is connected to gates of the second PMOS transistor and the second NMOS transistor and drains of the first PMOS transistor and the first NMOS transistor. Then, for each detected arrhythmia, a determination is made based on the data, whether there was a myocardial ischemic episode detected within a specified temporal proximity of the arrhythmia. The method includes flowing a heated fluid through a diffusion member against a backside of the substrate in a configuration that is configured to generate a constant processing temperature across the front side or processing side of the substrate.

1459828657-0d29c957-00bc-40be-8f6c-df4a63a59055

A system and method for establishing and maintaining an \u201calways-on\u201d data connection to a wireless network through the use of a back off timer and a service check timer is disclosed. Said universal module, can be optionally joined to a connector module which allows the union of two or more universal modules in a curve or straight shape or in three or more ways. In this way, the user may ensure a secure payment to a third-party through the network associated with a financial institution. The three memory chips stacked on the memory chip of the lowermost layer are disposed so that their short sides on which pads are formed are located

at the front end of the memory card.

1459828657-abd77a3f-2e0f-47a7-b0e4-12dbf9a5675b

An overvoltage protection control circuit includes a voltage conversion circuit, a voltage comparison circuit, and a switching circuit. The network device interface interprets commands and data received from the controller and polls the data channels in accordance with these commands. The mixer generates a modulator input by mixing data with a half clock signal.

1459828657-e1533401-e80b-48fe-9b8c-8993ee10843f

A method is described that involves identifying one or more images of respective one or more fixed markers. A memory system has a rewritable nonvolatile memory, a buffer memory, and a controller. The pole may include first and second arms that extend substantially vertically upwardly from the base, each arm made up of respective lower, central, and upper telescoping tubular portions. A test input file is partitioned into a number of segments, wherein the number of segments equals the number of test instances. Alternatively, routability may be estimated.

1459828658-6ca80ee5-76ca-44b8-bf83-7725c5cef374

We describe here a system and method which makes use of \u201cnarrative patterns\u201d to assess and affect the state of affairs within and among given organizations and communities with respect to given issues or objectives. In one embodiment, an apparatus includes a complimentary metal oxide semiconductor switch and a switch sense block. The memory buffer includes a serial interface over which commands are received from a memory controller. In an embodiment, the elements and its support are made of quartz. The emitter has a stack structure formed of a resistive material layer and an electron emission material layer containing a fine electron emission source formed on the resistive material layer.

1459828658-c160cc08-398e-4794-9302-0bb3470c45cd

A method of applying realtime effects to at least one lighting channel for a lighting fixture or luminaire is disclosed. The housing includes slots configured to receive and secure a lens. A protection circuit for the diode includes a first resistor and a second capacitor connected in series with the protection circuit connected in parallel with the diode.

1459828658-c5a03899-86d8-401a-a6fa-bb4a164f972e

An improved squeeze chute apparatus, which may be portable or stationary, includes a frame having an entrance end, an exit end, a first side, a second side, an upper end and a lower end. The pump includes a housing having an inlet tube on one end and an impeller casing on the other end. 005 weight % or more and less than 2. Slits are disposed in the plurality of flat portions of the clip main body, and the collar portions of the cup portion and the fuel damper are disposed therein and locked in a diameter-reduced state of the clip main body in which the clip main body is tightened.

1459828658-cebebd12-8eb8-4b9f-a7ca-024e1c550b28

Sputtering particles emitted from a target are ionized by the Penning ionization process. In one aftermarket embodiment, the method is implemented in an aftermarket remote start interface module. The surface tension at the edge of the slide is broken by the stream. The charge pump oscillator is enabled by the output of a comparator.

1459828658-d6cfbb15-75dc-4d32-bc3f-8a0d1573885b

A 3D surface wound, injury, and personal protective equipment data entry system provides an easily usable graphical user interface through which an examiner can objectively record data relating to surface wounds and injuries sustained by a subject human, as well as PPE used when the wounds/injuries were sustained. The nitrogen molecular defense system includes attaching bulky organic groups to charge

transport materials. A wet etch step is used to remove an oxide portion of the hard mask overlying the ILD, followed by a final touch-up Cu CMP step which chops the protruding Cu patterns off and lands on the SiCOH hard mask. The shock wave generator is moveable within the balloon to vary shock wave impingement on the valve.

1459828659-7c3a6ca4-639a-4281-bf4d-e08fbe256c5e

Dispersions of superabsorbent polymers are described comprising blends of polyols and super absorbent polymer. A logical partitioned data processing system typically includes multiple memory units, processors, IO adapters, and other resources enabled for allocation to multiple logical partitions. The search mechanism processes multiple filter rules for an application without requiring multiple searches and also allows various filter rules to be chained.

1459828659-964964a7-0406-444b-a90c-c10522c8be69

A filling material is produced by separating fibers of polyester, processing the separated polyester fiber, obtaining silver nylon material, separating the silver nylon, processing the separated silver nylon, and blending the processed polyester fiber and the processed silver nylon to produce a blend of polyester and silver nylon. To reduce response time, the storage managing server receives a first request issued from a storage managing terminal for executing the processing of the storage managing server, and a second request for executing processing including the communication of constructional information of a storage device between the storage device and the storage managing server. An input/output of a first side of the interconnect assembly is formed on a surface of the lower contact pads that is opposite the first surface of the lower contact pads, and an IO of a second side of the interconnect assembly is formed on a surface of the upper contact pads that is opposite the first surface of the upper contact pads. Advantageously, multi-parameter numerical optimization techniques may be employed in which the parameter set is varied to determine the overall optimal length  $L_{1opt}$ .

1459828659-b77b755d-3418-4a80-a6cd-f301a090f654

The apparatus is provided for sealing a vascular puncture tract by forming the autologous plug within the puncture tract, and extruding that plug into the puncture tract. The tray includes a sheet holding surface configured to hold the sheet. The graft copolymer is also such that a main chain moiety mainly consisting of the main chain and a side chain moiety mainly consisting of the side chain have microphase-separated structures. In another aspect, the control unit has a second mating surface complimentary to the first mating surface and a sensor configured to detect the presence of a flame disposed on a wick. Advantages include cost reductions and improved reliability due to fewer components and therefore fewer points of failure.

1459828659-ba4d763d-b128-47e4-868b-3ed0f0ebd8db

An elongate sample volume matching an elongate region of uniform RF magnetic field established by a saddle coil, is approximated by at least one pair of cylindrical sample tubes in parallel orientation with the geometric axis of the saddle coil. In an anode 122 connected to a drain interconnection 120 of a current-controlling TFT 202, slits are made. The control unit controls velocity of the transfer arms such that the simultaneously driven transfer arms simultaneously arrive at target points.

1459828659-cc04f885-3c5e-47a5-ad5b-e92141555fd8

The present invention relates to a generator of energy as a dynamo-electric machine with employment of the parallel and superposed forces, of artificial electromagnetic reaction between the primary and secondary of natural ferromagnetic reaction between the secondary and the primary. The method includes the steps of preparing a GaN seed crystal substrate including a first dopant such that the thermal expansion coefficient of the GaN seed crystal substrate becomes greater

than that of the GaN crystal, and growing the GaN crystal to a thickness of at least 1 mm on the GaN seed crystal substrate. A pressure sensor measures atmospheric pressure and inner pressure of the ink chamber.

1459828660-1ecd3ec5-bebe-479a-b95b-b3a1c22063d1

Provided is a credit card usage management system, which allows a credit card to be used to an extent that surpasses a credit limit defined within a fixed period without increasing the credit limit. The torque fitting generally comprises a threaded body portion and a torque-limiting body portion, wherein the threaded body portion and the torque-limiting body portion are arranged substantially concentrically along a longitudinal axis of the fitting. The method includes exciting the magnetic coil with a basic current intensity during an opening phase of the fuel injector, shortly before the end of the opening phase, exciting the magnetic coil with a current pulse that is increased compared to the basic current intensity, and, at the end of the opening phase, switching off the current exciting the magnetic coil. At least one halogen is provided within the chamber during at least one of the aluminum containing organic precursor flowing and the alkoxysilanol flowing under conditions effective to reduce rate of the deposit of the silicon dioxide comprising layer over the substrate than would otherwise occur under identical conditions but for providing the halogen. The throw-type compact reconnaissance robot includes a cylindrical body with a camera, drivers made up of two tires that are disposed on opposite sides of the body and is drivable individually, and battery units supplying power used to operate the robot and disposed in inner spaces of the tires of the drivers on the opposite outermost sides of the robot.

1459828660-2ef6e0b6-d708-44bf-b53a-2eb26430c130

A method and kit for determining a concentration of iron in brake fluid when contacting a colorimetric reagent such that a color results. Specifically, a method and system is provided that allows a control panel of a secure access system to verify the authenticity and fidelity of a reader within the secure access system by utilizing a rolling code agreed upon by the reader and the control panel. The gangway and its associated cage are slidably connected to the platform via a track carried along the side of the platform. The detector is configured to detect whether the service information stored in the first memory is appropriate each time the communications terminal starts a call connection operation to use the specific communications service based on the condition information. The data controller has a priority-reset means for increasing a priority of a received data before being sent. The filling is accomplished by cooling a pressure vessel, filling said vessel with at least one type of gas at a temperature which is higher than the boiling point thereof and closing the cold vessel.

1459828660-4edd6267-b8e9-44e5-8b8c-15816207ef49

An engaging element for engaging tissue is described. The high-voltage winding includes an electrical conductor, an insulator surrounding the electrical conductor, and an electrically conductive layer surrounding the insulator. A pessimistic assumption is made upon issue that denormal handling will be required and accordingly the write port reserved is a first predetermined number of processing cycles after the start cycle to take account of use of the denormal handling pipeline stage 20.

1459828660-78651fe5-ced0-41a7-96c0-69ba52696542

The present invention provides cyclic 1--alkyl prodrugs of GABA analogs, methods of making cyclic 1--alkyl prodrugs of GABA analogs and compositions of cyclic 1--alkyl prodrugs of GABA analogs. The vehicle can either detect the position detection elements, or the position detection elements can be sensors which detect the vehicle. On the lower surface side of the fixed hood, is disposed a fixed duct in a state that when the bonnet is closed one end of the fixed duct is connected to one end of the movable duct in the air flow direction.

1459828661-02f529e7-5908-4691-890b-68b950377cbc

Minimizing the damaging effects of loud music but with minimal reduction in aesthetic quality of the music. The adapter structure includes a main body. The width of the grooves and the size of at least the drive sheave in the system are selected so that a ratio of the groove width to the sheave diameter is within a selected range. Alternatively, the concentration of oxygen in the first layer may have a two-dimensional fluctuation, and a first region where the concentration of oxygen is equal to or higher than 40 atomic % and a second region where the concentration of oxygen is equal to or lower than 35 atomic % may be provided in the first layer. The sheet processing device further includes the housing holding the cutter, a locking member locking and unlocking the door closing the opening and a locking mechanism mechanically connecting the movable unit to the locking member and causing the locking member to lock or unlock the door depending on a position of the movable unit relative to the predetermined position. At the time of charge-control beam illumination and at the time of signal-detection beam illumination, an aperture pattern of the aperture array is selected, and conditions of a lens array, surface electric-field control electrode and the like are switched in synchronization with each beam scanning.

1459828661-f7785882-cd8a-4e81-bed2-b0d7bc1d7e67

A wind resistant sign enabled with a release mechanism providing for the sign pivoting from a starting point about an axis when the sign is exposed to a user determined threshold wind speed and a mechanism for returning the sign to its starting point when the wind speed decreases below the threshold. The plurality of predetermined conditions include a condition that a playback apparatus has a capability of playing the elementary stream, a language attribute of the elementary stream matches a language setting of the playback apparatus, and a channel attribute of the elementary stream is surround sound and the playback apparatus has a surround output capability. Each of the first and second electrochemical desalination devices comprises a plurality of successive operation cycles. All bearings for the pinion gear are physically located within the gear reduction unit. The incoming transactions are then presented to the plurality of agents. The buffer includes a peripheral buffer and a central buffer that has a step-shaped structure.

1459828662-288d2052-48fb-4a21-8c97-c4f4ceb491a3

A mortar of a granulated mineral wool, a hydraulic binder and water is placed on a roof to prevent roof covering layer of a substantially flat roof from being blown up in stormy conditions. The movement adjuster comprises an actuator, connected to an adjustment cam and actuatable so as to turn the adjustment cam about its own axis through preset angles. The restriction surfaces are disposed in the flow path such that fluid delivered to the inlet passes between the opposed restriction surfaces prior to flowing from the outlet. The broadcast rate of traffic information updates may vary temporally or geographically. The detector is configured to detect a low coherence interference signal including light that has passed along the reference optical path and light that has passed along the measurement optical path. The fan is rotated by an oil flow produced by dipping up oil for lubricating the engine.

1459828662-47b0cdde-7931-45fe-915d-3a87fc37d532

Disclosed herein is a compressor in which oil retained in a hermetic case may be raised through an inner circumferential surface of a rotating shaft. An identifier is read from a lift access product when the lift access product is in the vicinity of a lift boarding area and a scan record containing the identifier, location information of the lift boarding area and a time stamp if generated. With the large surface area, the electrode system of the present research improves efficiency and performance of various electric devices. Since the gas is introduced to the rear surface of the diaphragm through a small passage while the front surface receives pressure with a relatively large area, the protecting member covering the rear

surface is made softer than that covering the front surface. At a server of the service provider, one or more photographic prints of the selected images are automatically printed, packaged, and sent to the delivery addresses. The test mode controller outputs data to the pads from one of the first and second bank groups and then outputs data to the pads from the other of the first and second bank groups.

1459828662-77a27b7b-11fe-4a1f-a251-52699e147918

The present invention relates to a process of forming a phase-change memory. This system includes a memory controller which is coupled to a set of memory chips, wherein each memory chip includes a phase detector configured to calibrate a phase relationship between a data-strobe signal and a clock signal received at the memory chip from the memory controller during a write operation. The isolation assembly includes a shuttle moveable within a housing, and plurality of ports to selectively provide fluid communication from within the isolation assembly below the check valve, through the ports, and into the annulus, thus allowing selective surface-controlled equalization of downhole equipment. A control unit is arranged to control the gear clutches so that the gear clutches simultaneously engage at least two of the gearwheels thus to braking the output shaft. A binding comprises a coupler on either the shoe or wakeboard and a corresponding coupling mount on the other of the shoe or wakeboard to receive the coupler.

1459828663-5e7142b6-5b29-4022-87ec-477004439ed5

A digital reception apparatus includes a receiver that performs reception processing on a received signal and an adjuster that adjusts the amplitude of the received signal after the reception processing. The mounting members are attached to vehicle frame portions at the interior of the body structure to securely fasten the body structure and vehicle portion together. A three-dimensional plastic sheet can be provided to the transfer section of the rendering device. Then, the coated substrate can be selectively surface activated proximate to the defect, thereby forming at least one selectively surface activated region of the coated substrate.

1459828663-6237d19b-dd3e-48de-bb6b-987f36b7b02d

Under-cabinet lighting systems and methods include lighting fixtures are capable of being hidden from view by a decorative molding forming a part of the cabinetry. Such a hub represents a mechanical connection between the rotor shaft and the rotor blades. In an embodiment, wire bonds connects pads on the die to pads on the substrate.

1459828663-6401fd36-7d88-4949-89ec-bcfc08d279ae

System and method for transferring data from a first subscriber identity module card to a second SIM card are provided. A distortion amount is calculated in accordance with the difference between the position of a reference virtual ray and the position of a virtual ray projected during creating of the exfoliated picture, coloring is added to the virtual rays in accordance with the distortion amount, and the colored virtual rays are projected to generate exfoliated picture data. The coupon card is capable of scanning coupon bar codes from paper coupons and receiving redemption requirement data from a periphery device. A user or users are alerted to any change in the monitored document according to the user's preferences. Additionally, the data can be processed in a manner in which the green image elements are demosaiced first and then the red and blue elements are reconstructed based on values of the demosaiced green image elements.

1459828663-dbab75e2-f8da-4d58-998f-837cf2b43548

A process for preparing potassium monoethyl malonate by selective saponification of malonic acid diethyl ester with potassium hydroxide, in which the potassium hydroxide is added to the malonic acid diethyl ester, malonic acid diethyl ester and potassium hydroxide are used in a molar ratio of at least 1. The method includes a computer determining popularity of the previously broadcast video based,

at least in part, on a number of requests to rebroadcast the previously broadcast video. A pin extends generally outward from the shaft and includes a distal end. The control unit also includes: electrical means for monitoring the movement of the point blades and/or reaching of the end position, timing means for stopping an actuating stroke of actuators moving the point blades, and means for switching the direction of the actuating stroke. Valves that may be deactivated are controlled in a manner to reduce hydrocarbon emissions during the start of an internal combustion engine. Storage locations on the storage media are selected for streams of MPEG data according to the data rates of the streams of MPEG data and the properties of the available storage locations on the storage media.

1459828664-21ef5f94-a688-4810-80cf-e378140d240b

An Apparatus and method to produce a hologram of a cross-section of an object includes an electromagnetic radiation assembly configured to receive a received electromagnetic radiation, such as light, from the object. The device includes a first compartment delineated by a container and a second compartment at least partially delineated by a body connected by an intermediate part to the container. The switch is used to duplicate at least a subportion of the payload portion of a data unit within the stream of data units, and to enable access to the duplicated subportion of the data unit by two or more conferencing participants. The latch has a hook portion at one end and a transversely extending tab portion at the opposing end.

1459828664-9bdd29af-589d-4e4a-8d87-44cfb4770f49

A submersible electrical connector assembly includes an electrical connector mounted to a first substrate where a second substrate adjoins the first substrate. Embodiments may include a remote connector agent apparatus having a main body forming a connector cavity and one or more insertion snap pushers each having a lower surface. To this end, a solid core material is coated with an activable material and an outer panel is arranged in such a way as to form a hollow space which can be filled through the foaming action of the activable material. The subject invention also relates to other medical procedures including, but not limited to, cardiac output measurement, chest imaging, inhalation therapy, oxygen delivery, blood pressure measurement, extracorporeal shock wave lithotripsy, and pulse oximeter optoplethysmograms. Also provided is a compound of the following structure: . The inventive method also enables cancer cells to be removed totally from fluids or fractions thereof containing cells.

1459828664-b9c69d8a-bf8c-4a7b-a436-594eafc85824

A developer replenishing device included in an image forming apparatus of the present invention replenishes a developer from a developer container to a developing device and allows the developer container to decrease in volume when air or the developer is discharged from the developer container. The capsule is formed by laminating two dome-shaped films together at the peripheries thereof. It is possible to update and re-seal sealed data having a usability condition of matching with predetermined terminal environment information during a secure boot without rebooting a terminal when a program using the sealed data is updated.

0.2% or less measured at a compression density of 0. The present invention also broadly comprises a one-way clutch with inner and outer races, at least one engagement element, and at least one elastically deformable element. below the minimum reaction temperature, and is provided at the pressure.

1459828664-c27585c4-6a99-43d4-ace7-985f51dd1723

A plunger mechanism is formed of a plunger having a cylindrical body with a half-spherical tip. The electric motor includes a hollow output shaft of which the ends are located at and flush with two opposite surfaces of the motor, and the indicator includes a male coupling member with a cross-section matching the cross-section of the hollow motor output shaft. and the characteristics will not be varied so much even after a long period of use in a high temperature and high humidity

environment. Two parallel close sides and two parallel distant sides. The bit line voltage is correlated to a first control voltage on the addressed first selector, coupled to the addressed phase-change memory cell.

1459828664-d9060691-4f2d-4ec9-b16a-a542a9a5367a

In a linear compressor having a compression mechanism for compressing and discharging a refrigerant, an inflammable refrigerant or a natural refrigerant such as propane, isobutane, carbon dioxide or the like is used as the refrigerant while no lubricating oil is filled up, thereby improving the system efficiency and reducing the amount of refrigerant. In one aspect of the invention, each method within a class file is associated with a corresponding reference cell. The system includes a first server interface for receiving a message containing a PRID associated with the call, a second server interface to access the data base for searching for the PRID in the data structure; a third server interface to receive an output from the database indicating whether a PRID has been found in the data structure; and a fourth server interface to send the call to a PSAP. When the specimen is pressed against a pressure detecting region, both electrodes touch each other at a sensor part corresponding to a protrusions of the specimen and are separated at a sensor part corresponding to a recess. A dispersion compensator compensates for dispersion in the multiplexed light. The nose pad is installed by passing through the insertion posts to the vertical through hole in the upper projection and fastening the ends of the insertion posts onto the positioning groove in the lower projection.

1459828664-dd038aeb-64b1-4092-91ac-0f64149e21d3

A fuel cell section system has a media-cooled fuel cell with an anode space and a cathode space. Each key is provided with a long weight lever disposed along the length direction of the key 3 at an upper part of the key on the side opposite of the key to the playing side. Further described, is a catalyst used for the reduction reaction which is a catalytic system including a composition based on cerium oxide and including niobium oxide in a proportion by a mass of from 2% to 20%. To shorten the path that current must travel through the contact, one spring arm terminates in a bellows leg that extends proximate to the second spring arm.

1459828665-0a69c47d-81b5-40dc-b88d-db61611edda3

A method, apparatus, and system is described for distributing a rule to a distributed capture system and storing the rule in a global configuration database, wherein the rule defines an action for the distributed capture system to perform regarding packets intercepted by the distributed capture system. The goggle frame can define opposing lateral portions and a central portion. Each of the one or more blocks includes a preamble and a plurality of operators ordered for execution in a predetermined sequence, wherein for a specified block the preamble defines one or more conditions required for uninterrupted execution of the operators included in the specified block. The method also includes generating an integrated image frame wherein each pixel having detected motion is integrated by an amount less than that of those pixels for which motion is not detected. With this configuration, reaction fluid, such as a hydrogen containing fuel, is effectively prevented from leaking through the rib cutting part or a frame cutting part, thereby enhancing the stability of a stack and the power generation efficiency of the fuel cell system.

1459828665-2ad2b671-cdbe-4657-9225-8e87ee66bbab

A core construction for use in a filter element includes a tubular member having a wall with opposite first and second ends. The process comprises contacting contaminated carbon with peroxide-containing materials for a sufficient amount of time using enough peroxide to provide effective disinfection in a process that is relatively non-hazardous, convenient, and carbon-friendly. Thus, even after a calling process unloads the driver, it remains loaded for a period of time longer because of the spawned delay process and allows the operating system or an applicationprocess to use the driver again within the delay time without requiring

the driver to be re-copied into memory or re-initialized. Forming at least one opening to a working surface of a silicon substrate of the semiconductor device. The trihalosilane has the formula  $\text{RSiX}_3$  wherein R is an alkyl group having from 1 to 4 carbon atoms, an aryl group, and wherein X is a halo atom.

1459828665-9e0f0636-c870-4c7f-a472-a8fd7f2ea0c7

A system for stabilizing the angle of incidence of a beam of electromagnetic radiation from a vertically oriented Arc lamp onto a horizontally oriented sample surface. The first gate electrode and the second gate electrode are electrically insulated from one another, which can be effected by means of a portion of the storage layer sequence. In a preferred embodiment the dynamic range and noise rejection level are varied for different regions of a patient's anatomy as a function of all scanning coordinates being used, including varying depths, steering angles, and linear positions for both sector-type and linear-type scans. The movable valve includes an inlet ball valve for limiting the flow of pressurized fluid into the hydraulic section and an exhaust valve for limiting the exhaust of pressurized fluid out of the hydraulic section.

1459828665-e025963b-c1a5-4884-859f-9c40767d6a65

The information categorizing apparatus comprises a feature element extraction section which extracts a feature element for each categorizing category from a plurality of sample texts included in the categorizing sample data in which a sample text group and a plurality of categories are associated with each other in advance. The heat exhaust exhausts heat from the heat exchange unit to a remote location from the electronic device. The ring is made of electrically insulating plastic, and the plate edge is accommodated in a watertight manner on the inside of the ring.

1459828666-12827fc7-b902-429c-bf66-bd6dc8986d1e

An encoder uses output symbol subsymbols to effect or control a tradeoff of computational effort and overhead efficiency to, for example, greatly reduce computational effort for the cost of a small amount of overhead efficiency. The photo detector unit includes a substrate, which is patterned with a wiring pattern and transmits the light, a detector to detect the light, and a bump to space the substrate from the detector, and to electrically connect the detector and the wiring pattern of the substrate. Additionally, a moveable assembly may be coupled to the display. The nano fibers used as reinforcing material can be uniformly distributed within matrix components by a single procedure, and the contact area between the nano fibers and the matrix components are very large because the diameter of the nano fibers used as reinforcing material is small. A joint detection matrix is then formed based on the estimated spatial weights, the joint channel response model, and a user code channel assignment.

1459828666-356a00ca-6a41-45e6-b49e-959ad4c5396b

A voltage source inverter generating a poly phase AC signal is provided that includes an SVPWM controller. The device includes an elongate flexible member configured to be positioned adjacent the perimeter surface of the body structure, an atraumatic tip positioned at a distal end of the elongate flexible member, and an elongate body. \u2014CH2CH2\u2014C\u2014 \u2014. The plurality of driven teeth include a root transition for preventing a driving tooth tip edge from contacting an adjacent driven tooth. The linear grind marks increase a strength of the plurality of semiconductor die to resist cracking. To accomplish this object, the power supply for a vehicle controller is maintained by allowing a self-holding relay to stay on even after turning off an ignition switch.

1459828666-a1e36364-2d42-4a5e-b998-9b06345f0269

A device for hanging an object on a surface. The received signals are despread on a transmitter antenna-by-transmitter antenna basis according to a preset spreading factor. It is determined whether the drive serial number or a world wide node name

are in an entry in a drive table. When deployed, the inflatable structure is of substantially increased interior volume. The electronic component may include any one or combination of a radiation emitter, a thermal or optical sensor, a resistor, and a microprocessor or other semiconductor component.

1459828666-e33bb993-1afa-4ec2-ab30-417e28adf7ed

A lamp having a longitudinal axis, comprising of a burner pinched at one end and a cement less base holding the contact points protruding from the burner. The composition has a high gloss and a deep black color that is unexpectedly much more light stable than a comparable black-color plastic using a carbon black pigment. A computer-controlled milling machine utilizes the image to form a solid model of the breast.

1459828666-f92dbaf0-3a6d-4c81-b0f3-0a8a3b174a17

Conventionally skinshades are tanned with metal-ions and vegetable tannins. Said heat flow is lower at night and during weak insolation and begins to increase when the lattice is solar heated. The digital processor is configured to process the electrical digital measures to recover the data carried by the optical input signal.

1459828667-127a31fd-7fd4-4fe4-94df-ddb5ac8f645f

This invention is directed to an electronic device with an embedded authentication system for restricting access to device resources. A delivery device integrated with the at least one oxidizing catalytic converter delivers a reducing agent into the exhaust-gas stream of the engine. A timing path detector can connect with the security processing unit.

1459828667-7ecfda65-b56e-4763-8fef-7ff2a1cff11f

An ultrasonic diagnostic apparatus is disclosed which can reduce the device amount of a receiving circuit, while obtaining the shape of an excellent received beam. Methods of preparing the compounds and uses of the compounds in therapy, in particular for a CNS disorder such as depression or anxiety, are also disclosed. The click spring relatively rotates the output rings by the stoppage of the rotation driving of the output gear.

1459828667-b19fb43b-2cf0-4059-aa78-b0420bf2f105

A media cassette includes a body having a removable lid. A photographically captured source image of an item is obtained. The housing has inlet and outlet channels formed therein, with the outlet channel running through the interior of the inlet channel. The transition regions undercut the groove side faces, wherein the rounded transition regions are configured, at least in part, as circular arc segments which undercut the groove bottom.

1459828667-df6cc627-fcbc-44b6-99a2-f4c6b5d07adf

A hose clamp which can be produced at a low cost and quickly clamp a hose is provided. A service provider of the wireless wide area network may then use the indications in the electronic records, at least in part, as a basis for billing a user of the wireless device. The resulting display device offers a lower cost display device having greater flexibility for a wider variety of applications than traditional image display devices, without compromising image quality. A first load transistor is connected in series to the amplification transistor and is controlled by a second control voltage.

1459828668-07c0d964-1bb5-4526-a153-5f70be13e2da

The invention features compositions and methods for site-specific modification of proteins by incorporation of an aldehyde tag. The unit comprises a series connection of, successively, a coring circuit, a differentiator, and a limiter. Accordingly, since it is possible to accurately distinguish whether an object existing in the lateral or oblique direction of the vehicle is an approaching

moving object or a stationary object, it is possible to appropriately determine whether or not the object is an approaching moving object. An approximately hemispherical acetabular component is then disposed in the prepared acetabulum to provide for hip rotation relative to the femoral component. A second conductive layer covers the opening of the passivation layer and is electrically connected to the first conductive layer. The plasma display apparatus also includes a barrier structure, the inner surfaces of which being disposed along the outer ends of the plurality of display element electrodes and thereby defining a plurality of cells each of which is to be activated by the associated one of the plurality of display element electrodes so as to emit light.

1459828669-e28ff78f-3d02-467c-b70c-801f9609ec1a

In a temperature sensor circuit, a temperature sensor is configured to output a first voltage corresponding to temperature. This invention thus relates to the seeds of soybean variety XB42K07, to the plants of soybean XB42K07 to plant parts of soybean variety XB42K07 and to methods for producing a soybean plant produced by crossing plants of the soybean variety XB42K07 with another soybean plant, using XB42K07 as either the male or the female parent. Selecting a Walsh code in accordance with the Walsh code number determination and assigning the selected Walsh code to the new call are set forth. The output of these prediction algorithms is used, together with chemical bonding measurements of the dielectric that is being investigated, as input to a program that computes the dielectric properties of the dielectric.

1459828670-3fcdb6a9-5a0f-4b1d-a67a-b09dd2141e8d

Disclosed is a method for electric clamping, which performs a clamping process in parallel with a core-drawing-in process, avoiding damages of molds and core mechanisms and enabling secure clamping. The first threshold is applied to the incoming sampled analog data. , greater than about 60-95% of the cerium present is reducible. Another feature is the geometry of the refractory chamber and the interaction of that geometry with heat energy introduced into the refractory chamber. In one embodiment, a method includes determining a power mode to be at least one of a primary power mode, a backup power mode, and a series power mode; and selectively controlling power to the power latch system based on the power mode. The cartridge bounds a reservoir space for holding the substance to be dispensed and includes a flexible wall part bounding the reservoir space for allowing reservoir space volume to accommodate to a volume of the substance filled therein and volumes of the substance dispensed therefrom; a rigid wall part also bounding the reservoir space, and a rigid housing.

1459828670-826c1e58-36ff-4c6b-bb36-ac1d0fda0ab5

Calibration circuitry and method for maintaining constant signal detection thresholds for multiple signal receivers that receive data signals in the form of current signals. The slurry delivery subassembly includes at least one transport tube extending longitudinally along at least a portion of the sand control screen assembly. The main body member has position reference holes formed therein so as to serve as position references for the direction change pipes, respectively, whereas the direction change pipes have positioning protrusions formed thereon so as to be press-fitted into the position reference holes, respectively.

1459828671-af8e5112-21a9-4a5a-8332-1afb68d980a3

A method and apparatus for reducing a length of an antenna involves an arrangement which includes an orthogonal antenna feed. A time measuring device measures a time difference between a time when one of the first and second detecting devices firstly generates a pulse signal and a time when the other one of the first and second detecting devices firstly generates a pulse signal after measuring start. The method generalises the use of information retrieval ranking methods such that these and new ranking methods are available for relational databases. The lines of sight of both eyes of the observer are then detected, and a distance from the view

point of the observer to the subject is measured based on the line-of-sight data.

1459828672-3e9373f0-00fa-4a7a-b0c7-dd7290c3b13d

Aspects of the invention provide an improved solution for processing packets in a packetized communications network. Fundamental molecular vibration modes of target contaminants present are briefly activated after the surface has been driven out of thermal equilibrium. The coated cores are agitated as their coatings expand to prevent them from clumping or agglomerating during baking. The first thin film transistor and the second thin film transistor in each pixel unit are connected to a same one of the gate lines and a same one of the data lines, and to the first pixel electrode and the second pixel electrode respectively. The logically partitioned data processing system also includes a hypervisor for creating and maintaining separation of the plurality of logical partitions. The fuse booster system uses shaped charges that will ignite the main high explosive charge of the bomb or penetrating warhead, and also remove portions of the bomb or penetrating warhead to reduce the power of the bomb at the target in a measurable manner to control the lethality and collateral damage of the bomb or penetrating warhead.

1459828672-5c49fc3f-4187-44aa-841c-7fbb1d2e0888

A method and system for probing with electrical test signals on an integrated circuit specimen using a scanning electron microscope positioned for observing a surface of the specimen exposing electrically conductive terminals on the specimen. The photoreactive resin composition contains an inorganic powder containing a polyvalent metal powder and/or a polyvalent metal oxide powder, an alkali-soluble first polymer having an ethylenically unsaturated double bond, a monomer having an ethylenically unsaturated double bond, a photoreaction initiator, an organic solvent, and a second polymer having a pyrrolidone ring in a side chain. Then, an orthotic is selected from the set for which the standard arch height most closely matches the measured arch height. The low-voltage connector is arranged on a rear side in the vehicle. A first tongue plate is formed on the sidewall of the housing and bends inward. The conductive particles accommodate height variations among electrode terminals, allowing the composition to achieve stable interconnects between all electrode terminals.

1459828672-7cf201f5-adf3-4794-b53e-a285edfdd2f0

Cutting machines with high-speed safety systems, and firing subsystems used in high-speed safety systems, are disclosed. A nose extends from an upper portion of the first end and is adapted to engage an upper surface of the building block. First they compute the optical density setting of the lenses for optimal viewing of 2D movies as 3D. A user interface allows a user to insert entities from the library into the process diagram and insert connections between the entities to show logical relationships between the entities. Next, the negative pressure is applied again at time point 166d for a definite period of time.

1459828672-ebc789b4-f357-4dc5-8a2b-e3ad683c8f98

A bone screw extender reattachment system including an elongated reattachment rod having a proximal and a distal end. The detectors are arranged in a readout circuit that can be constructed on a monolithic semiconductor product such that one or more of the detectors can be switched on or off to include or exclude an output contribution from said detectors and enhance the response of the pixel. The rooting pin having a laterally open recess. Systems for performing the methods, as well as computer-readable media for performing the methods, are also described. A bulk amount of the food starch material is placed into the puffing chamber. For control purposes the current or capacitance is measured by a measuring electrode encircling the cable and connected to a high frequency source.

1459828673-266a450c-6a19-4eeb-b899-274e755b9a04

Method and system for manufacturing CMOS image sensing device with reduced blooming. This tool enables a single person to easily attach the sheathing to an

underlying structure. The holding member and the mounting flange are fixed to each other by plastic shaping of at least one of the two members. The invention is suitable for promoting non-anatomic or heterotopic bone growth between any bony surfaces where bone growth is desired but does not naturally occur.

1459828673-4200a882-b898-4fab-8566-7994b7025d8e

A packaged semiconductor device includes a semiconductor chip having at least one selectively thinned substrate region. The intelligent router can be used alone or in combination with a second intelligent router. Data can be collected continuously. The method further includes acting on the request in accordance with a control policy defined by a pluggable policy.

1459828673-7c05ab31-a626-4d58-b41b-7a36532bc452

A system and a method for allocating dividends to stock shares are provided. A substrate used for manufacturing the semiconductor device is fabricated by forming trenches in an n-type main semiconductor layer 1 and performing ion implantation and subsequent heat treatment to form an n+-type field stop layer in the bottom of the trenches. The method also includes generating a request for content, receiving an electronic file in response to the request, and evaluating the electronic file to recognize a match between at least one portion of the electronic file and the data pattern. The rim is releasably secured to a ceiling surrounding the recessed lighting and a decorative lighting fixture or lens may be secured to the rim.

1459828673-928913a6-3668-46ec-8ec7-ce5463d258f9

A method and associated apparatus for testing telephone system operation. The SLID bond exhibits a first metallic material and a second metallic material, wherein the SLID bond comprises the intermetallic AlSn-phase. The utility vehicle may also include an air inlet for a CVT cooling system positioned to draw air from the operator area.

1459828673-ef676457-0f0a-41b1-97c4-2e077df55352

A golf bag dolly assembly attaches to the base of a golf bag to facilitate moving the golf bag. The system includes a sensing apparatus configured to obtain positional data based on movements of a sensed object. Furthermore, the effective access latency of these traces is reduced.

1459828674-01bb3bef-ba84-4018-81d9-620a03826e68

A method and apparatus are provided for reducing power consumption in a data collection device. When a request is received for importation of content into a secured domain, a search is made in a signature certificates cache for a signature certificate associated with that requested content. In other embodiments, the video content is segmented such that a user is provided the ability to select one or more objects in the video. Data is continuously input, analyzed, organized, reorganized and used for specific commercial and industrial applications. The MR element has the above-described structure, thereby being capable of obtaining high resistance and a high rate of resistance change. In addition, by incorporating a uniquely constructed, moving wedge plate that is adjustably engageable with any cooperating anchor pin, secure affixation of the mounting member with the anchor pins of any diameter is easily achieved, regardless of the orientation configuration, or diameter of the anchor pin.

1459828674-66207095-1b9e-4927-9e25-98ae8414a118

The invention aims to provide a perylene derivative preparation process featuring satisfactory yields and improved preparation efficiency, a perylene derivative obtained by the process, and an organic EL device using the same. The proximal section includes a head defining an aperture for receiving a fastener, and the distal section includes a pair of expandable wings displaceable between collapsed and expanded positions. The method further includes executing, using a processor of the receiver, instructions stored in a memory of the receiver. The ramp voltage

signal facilitates the ring oscillator to output the waveform at a frequency that varies with time, wherein the varying frequency is within a frequency range of the crystal oscillator. In addition or in the alternative, the holder may be constructed and situated in a manner effective to draw fluid from the conduit opening to provide a controlled reservoir of fluid for absorption by the sample against gravity.

1459828674-66fb9d3a-328a-445b-9be3-af5a1fe9739d

A photomask blank has a light-shielding film composed of a single layer of a material containing a transition metal, silicon and nitrogen or a plurality of layers that include at least one layer made of a material containing a transition metal, silicon and nitrogen, and has one or more chrome-based material film. Using a feedback relationship, a bias for a main stage that receives a first differential input of the comparator is produced. Using plural gas streams from a nozzle reduces the risk of fluidization of the solid bed because the number of gas raceways in materials in the gasifier is increased. By the control of the number of Rx data units, the communication system controls the number of parallel-communication data units to be equal to a maximum value capable of being implemented by the MIMO-SDMA wireless data communication. The conductive element is conformed between the circuit board and the clasp.

1459828674-9a89449e-41c2-4c6a-9ad9-826abc50d99f

A connection apparatus and associated method are provided. The roof structure is formed by a pole members pivotally mounted to the upper ends of the legs so as to extend across the shelter, and movable between a lowered position and a raised, upwardly arching position. This targeted substance preferably selectively binds to the target tissue.

1459828675-e199be7b-6bb9-4889-9bcb-89f9fe3fb38a

A Guided Soft Target system and method provides a versatile test system and methodology for the evaluation of various crash avoidance technologies. The overall inspection quality is preferably substantially improved when the inspector and/or operator can focus entirely on the material under inspection while maintaining full control of the inspection equipment and the inspection process. , and can be used for advanced polymer material fields.

1459828676-2fae31e7-ab6e-45f5-866f-79ebc1df4240

An optical connector for contactless communication is provided. First, it is arranged in this invention that at receiving a gateway exchange instruction an information notifying means may notify a radio intelligent terminal of the generation of gateway exchange. 1 and that has such mutation that glycine is inserted as a 269th amino acid in the sequence.

1459828676-6a641dec-9e72-4b6e-a153-328979902872

A magnetoelastic torque sensor has an emission coil for generating a magnetic field in an object, the torque of which is to be determined. The compound may be used, for example, for the treatment or prophylaxis of obesity, hyperglycemia, dyslipidemia, and type 1 or type 2 diabetes. This stimulation sequence prevents the same set of nerves from being stimulated too often, which can result in stimulus adaptation and cause measurement inaccuracy. The method and system may optionally be used to record information about the query signals, the number of matches recorded, and other useful information about the query signals. A method of reading out multiple groups of pixels is provided wherein values corresponding to the charge collected by one group of pixels is readout at a different time than the values corresponding to the charge collected by another group of pixels.

1459828676-a98a8fe1-8046-47a8-a408-627b4a8ecd60

Memories and methods for providing and receiving non-data signals at a signal node are disclosed. The interface is configured to access one or more desired component

repositories through a web service. By holding the conductive portion of the film-deposition suppression device and the conductive substrate at substantially the same potential, film deposition on the other surface of the conductive substrate is suppressed. If the language of the text is not the language of the audio file, then a related language is determined. The controller also includes a peak current detector for detecting the peak of current flowing through the electromagnet in the first predetermined period. The invention is further directed to a pneumatic runflat tire comprising a sidewall insert, the insert comprising the rubber composition.

1459828676-bfab84d2-00ef-4be0-924a-59d7eaec8bf7

An x-ray CT system and a method are disclosed for creating tomographic recordings with the aid of an x-ray CT system, with two emitter-detector arrangements operating with an angular offset on a gantry with at least two different x-ray energy spectra. The supermagnetostrictive alloy has a degree of order of 0. By anisotropic back-etching of the dielectric layer, the semiconductor substrate is exposed at the bottom of the second trench. In preferred embodiments, the composition is injected onto a metallic or thermoplastic carrier. The first side surfaces are formed by cleavage along cleavable planes. Then, a second etching procedure is carried out on the silicon-containing photo resist layer to form a plurality of second openings by using the second photo resist pattern as an etching mask.

1459828676-ef4a1112-1fea-4767-a026-62ad5bc11baa

According to one embodiment, a method of processing broadcast data in a broadcast transmitter includes: encoding the broadcast data for broadcast service; encoding signaling information for signaling the broadcast data; assigning the encoded broadcast data and the encoded signaling information into a signal frame; and transmitting a broadcast signal including the signal frame. The RF transmitting apparatus comprises an interface, a modulating module, an amplifying module, a transmitting module, and an antenna. An improved method for forming such materials includes the solution diffusion of a storage material solution through a porous wall of a hollow element into an interior cavity. The first program may be transmitted with the first caption stream including first captions and may include first content configured to be played back at a first speed.

1459828677-067ea406-1ae7-4bdf-8a3d-0148cae8f06c

A composite conductive film formed of a polymer-matrix and a plurality of conductive lines less than micro-sized and its fabricating method are provided. The handle protrudes downward from the barrel. The temperature budget can be kept low in the base region since no implantations are required in order to reduce the base connection resistance. Each first surface refracts the light along a direction parallel or not parallel to the axis of the lens depending on the zone. The trough can be opened and the projectile can be recovered from the filling substance.

1459828677-09442abf-3de0-488d-9aa5-24ce8b81b526

The present invention relates to systems for circulating water in a potable water piping network to prevent the stagnation of water in this piping network. The various parts of the strategy may be graphically displayed to the user, and any modification to the strategy made by the user may be dynamically integrated into feedback of the graphical user interface. The system includes handheld software that allows an anesthesia provider to log information related to a patient during an anesthesia procedure. The single-chip multiprocessor system uses ILP to increase the performance.

1459828677-3d0b8a2e-a291-42db-aab0-3bc39fd4d136

The present invention provides a means by which the reliability of communication between any RFID reader and tag in an RFID system is improved by using an interleaved parity algorithm. The timing method contains generating at least a buffering area in the mobile station; receiving a first action executed by

a lower layer of the mobile station; after the mobile station receives the first action, updating a value stored in the buffering area; and if the value stored in the buffering area reaches a predetermined value, the mobile station performs a second action. The actuating assembly is mounted on the face plate, and has a means for receiving the toggle switch arm such that a linear movement of the receiving means moves the toggle switch arm from the first to the second position or vice versa. The presence of nitrogen and phosphorus in the silicon prevents diffusion of Si atoms into metal conductive layers such as aluminum, even up to diffusion and packaging temperatures. A second step is generating a code book having the ordering property for sub-matrices by utilizing the target vector and the code vector. The compression is accomplished by combusting a gas in a chamber and selectively diverting the high pressure exhaust to a container or conduit and selectively sealing the combustion chamber from the chamber when the chamber is reloaded with combustible gas.

1459828677-48521d2e-2ccc-4d80-803a-803661530ae6

In a method for manufacturing floor panels that have at least a substrate and a top layer provided on the substrate, the top layer including a thermoplastic layer that is translucent or transparent, the method may involve providing the top layer, including the thermoplastic layer, on the substrate. The invention encompasses novel compounds, analogs, prodrugs and pharmaceutically acceptable salts thereof, pharmaceutical compositions and methods for prophylaxis and treatment of diseases and other maladies or conditions involving, cancer and the like. The curved rod member can be mountable above a welt of a footwear. An AGC circuit incorporating a hysteresis circuit in the feedback loop is also disclosed. In this manner, the purchaser of the aeration service can avoid relatively high fixed costs that can be associated with various aeration hardware. Pharmaceutical compositions comprising compounds of the present invention and methods of treating conditions such as NIDDM and obesity are also disclosed.

1459828678-70f6b826-cd0d-4434-9379-ba4b0b95182b

An automated banking machine includes a mechanism for accepting deposited items. Cathodic arc source comprises focusing magnetic source for generating magnetic field, arc cathode containing film forming material and anode. The detector may be a standard sequence detector or a modified Viterbi detector, which calculates the branch metric using a pattern dependent equalized output and a pattern-dependent target. The accumulation section catches a determination result according to an accumulation-transmission signal.

1459828678-7815d30d-ff4b-46fc-b381-5a6b015c8f98

A convertible has a car body and a lid part arranged to the rear of the car body. When the first group III nitride compound layer is formed on a substrate by a sputtering method, the thickness of the first group III nitride compound layer is set to be in a range of from 50 \u002b to 3000 \u002b. At least one of the upper lid 52 and lower lid 54 is formed with a projection protruding toward the matrix 60 so that the upper lid 52 and the anode 10 electrically come into contact with each other and that the lower lid 54 and the cathode 20 electrically come into contact with each other. The method further includes exposing a portion of the interconnect layer through the second protective layer; forming a barrier layer on the exposed portion of the interconnect layer; and forming a solder bump on the barrier layer.

1459828678-786c4a47-9d58-4c77-ac5f-430fe893cd09

There is provided an optical recording medium-manufacturing apparatus that is capable of accurately transferring a disk-shaped apparatus during a manufacturing process, and at the same time occupies a small installation area. The component manager presents the URL to a download manager that asynchronously retrieves the component resources from the specified location and places the file in a staging area. In a slot-antenna embodiment, a microstrip feed line may be disposed on the substrate across a slot over the cavities. Tools made by the method also are

disclosed. A correction technique can be implemented to correct for liberated electron that become trapped to improve the energy resolution of the high-energy detectors disclosed herein. The device includes two coaxial case rings arranged one inside the other and connected by tubular radial arms through which fluid ducts and electric cables pass.

1459828679-4fa26879-8a44-4309-9404-efca7d50d4fb

The present application describes a process for conjugating a PNAG which is less than 40% N-acetylated to a carrier protein. Two pairs of electrodes are connected to a constant current circuit through analog switches respectively. The warpage prevention conductor overlaps with the external electrodes when seen from a z-axis direction in a plan view. The originating MSC system then receives a repeat dialing instruction from the calling party and transmits a repeat dialing indicator to the terminating MSC system. The use of poly co-polymer eliminates the need for a separate thickener. 0.5Nmm for a pseudo-adhesive state, a layer of an unvulcanized rubber composition in an order of layer layer layer to bond the layer layer so that the peeling strength, determined based on JIS K6256 at 30°C.

1459828679-50285041-9ae8-479f-aa41-9a0c9f5c7828

Fingerprint images that are required for fake-finger determination can be acquired with a single input operation, and the user-friendliness and the determination accuracy of a fake-finger are improved. The aluminum-based pad layer is also generally used as a wiring layer. In some embodiments, a number of spacers may be disposed between the top and bottom glass sheets to maintain a desired gap between the sheets. A method of fabricating a phantom is also described herein.

1459828679-79399d10-73c3-48da-b087-0989b92e9ead

In a head protecting airbag device, an airbag includes an inflation portion and a connection port portion. A first power supply network electrically connects the power supply and the first brake component, and a second power supply network electrically connects the power supply and the second brake component, the power supply networks being adapted to transmit the electrical power from the power supply to the first and second brake components respectively. According to the invention, the plug is placed and concealed in the storage recess, and the battery charger may be packaged and stored by occupying minimal space. A third and a fourth correcting unit having different precisions correct a total-width magnification error based on detections by the first and the third detectors.

1459828680-78da398c-feed-4bf9-9d8f-2a0006eb2215

A method and apparatus for providing welding power from an engine/generator driven welding power supply includes an engine and a generator. This is achieved by a fuel tank with a fuel cavity of variable size and a mechanism for compressing the fuel cavity. At this point, a voltage compensation circuit amplifies the voltage amplitude of the digital image signal or transforms the amplitude, and applies the result to a gate electrode of a driver TFT.

1459828680-c99955cd-d378-4dbe-8e14-6a765d7300ed

The present invention provides a compound of formula I and the use thereof for the therapeutic treatment of disorders relating to or affected by the 5-HT<sub>6</sub> receptor. In particular, the present invention relates to the optimization of the oil drain interval of a vehicle by using a base change interval and optimizing it based on the operating conditions the vehicle experiences. The first conductive features and the second conductive features each include two metal lines extending along the first axis. The adaptor device provides a basis for aiming or targeting a device such that the targeting device may be detachably positioned in a stable spatial position with respect to the body implant. Communication between the two persons is accomplished by exchanging digitally compressed video and audio via a voice or data network, either public or private. Next, the powder particles are embedded on the surface of the adhesive layer as a monolayer in which part of the powder particle

protrudes, so as to form a laminate, and excess powder particles adhered to the laminate are removed.

1459828680-e9d85989-c473-4d8b-9bcb-c63ca15ca891

A process cartridge is provided detachably mountable to a main assembly of an electrophotographic image forming apparatus. The front and rear surfaces may be parallel to one another, or may instead be non-parallel. The input module receives a description of a region of a document. The counter value is updated so that its value reflects recent trends in the input signals. As the result, the decoder will have more flexibility to schedule the execution of these commands. In some embodiments, the objects comprise casting molds or mold parts comprising a tile structure.

1459828681-b6d7c44e-d706-4789-b350-0ee5ef03c417

Polynucleotide and polypeptide UKW are specific for pancreatic tumors. Generally the invention has a frame clip and a spring clip. The felt for papermaking exhibits a hydrophilic capability as a felt structure from an initial phase of use. The second label layer releasably covers at least a portion of the first label layer so that the return address is not fully visible when the second label layer is releasably coupled to the container. The present methods can be combined with upstream analyzing of Unicode ranges for characters in the text sample to limit the number of languages considered. The equipment support comprises an equipment supporting portion configured to support patient care equipment and a coupler coupled to the equipment supporting portion and having first and second clamps.

1459828681-b90a192b-51de-4500-8e1c-bff76db47b5b

Sets of ranges typically are maintained using an associative memory and may be used to identify a matching range based on a query point or query range and to maintain sorted elements for use, such as in providing priority queue operations. A general-purpose processor and an auxiliary processing unit interface coupled to the general-purpose processor are provided. In one aspect, the fields are translated and/or modified in space at a speed substantially comparable to the speed of translation of the fastest particles in the sample. The scheduler determines the weight for each of the subscriber units based upon an instantaneous rate of consuming the finite resource. cooler than the feed temperature of the liquid reaction mixture to the flasher and the concentration of acetic acid in the crude product vapor stream is greater than 70% by weight of the crude product vapor stream. The transport roller includes an opening in the region other than the medium supporting region in a seam formed by matching the pair of end surfaces with each other.

1459828681-c5f44061-52c5-4486-bfe3-e31153886e6a

A plate handling apparatus includes a loader, first and second air cylinders, and first and second detection units. In one aspect, an apparatus is provided to generate an output phase at a predetermined time relative to an input clock signal and dependent on a logic phase width of the input clock signal. If the other one of the central or remote terminals receives the predetermined data and thereafter detects a predetermined period of silence, the startup session is terminated. According to the invention, the valve insert is configured as a slotted bushing, having a collar integrated onto the second end of the valve insert in order to increase an outer diameter and a shape stability of the valve insert.

1459828681-eb5e0792-190f-4254-8842-d3d7b5a6de9e

The present invention includes an apparatus and method for operating a gaming device that enables or activates one or more poker hands upon the receipt or wager of a single credit from the player. This tongue and mouth stud includes a means for dispensing a substance comprised of an internal cavity for storing and dispensing the substance contained within through one or more openings in the surface of the tongue stud that are contiguous with the internal cavity. The first position is

remote from the edge of a sheet stack in the direction of the width by a preselected amount. Moreover, the manner in which the strap sections are integrated alleviates the need to disconnect the seat from the garment in any manner when moving the seat from its stowed position to a deployed position.

1459828682-428eb438-9de1-4be6-8df9-b686c67da47c

A system for designing a circuit, which includes a module, uses a computer. The medium comprises a light transmitting substrate, a tracking groove formed on a surface of the light transmitting substrate, a recording layer formed on the surface of the substrate having the groove, and a reflective layer, formed on the recording layer, for reflecting recording and reproducing laser beams. The single object model can interact with a tag many times, as necessary to complete an operation. Alternatively, the electrodes and ferroelectric layer may be polycrystalline. The lens can correct aberrations by controlling DCMs independently.

1459828682-7f983225-d3e0-4fc8-b92a-d52d9c1a3532

This invention includes the step of transmitting a query to a set of search engines. The floor impact restriction device basically has a suspension attachment member and a floor attachment member. The signed bundle comprises a catalog of files in the signed bundle and their associated hashes. The layers may be selected so that a contact face of the flap member is sealed at a lower temperature than a sealing temperature for forming edge seals on the inner product contacting wall layers.

1459828682-b25e8bac-6a95-410a-a22e-371bdd37a24a

An x-ray source for generating x-rays with at least one narrow energy band includes an enclosing vessel, a first contact arranged with a first contact surface in the enclosing vessel, a second contact arranged with a second contact surface in the enclosing vessel, and an actuator assembly operatively connected to at least one of the first and second contacts. The selected global variables are less than all the global variables in the program. Parallellly to the fast OCR process, a high-precision OCR process is performed on at least the region of interest of the image, thereby obtaining a high-precision machine-encoded representation of the portion of the working area. In a more preferred embodiment, the belt includes a fastening strap that neatly secures excess belt by wrapping around the excess belt and drawing that excess against the remainder of the belt. Each of the plurality of pre-charge circuits may also be configured to charge the respective data line to a second voltage responsive to a second control signal. The vector may be selected from a subdivision surface that defines a set of vectors, or it may be selected from a set containing a vector pointing substantially toward a virtual light source and a parameterized vector pointing between the virtual light source and a virtual eyepoint.

1459828682-c3190545-e5a9-401a-bf9d-b0f41f91bca1

A method and apparatus for tidal seepage meters.  $80 \text{ gcm}^3$ ; the surface ratio  $\frac{S_1}{S_2}$  the peak surface  $S_1$  the peak surface  $S_2$  of an infrared absorption spectrum which is not larger than 2. The molded article also includes a reinforcing material adhered to the inner surface of the outer film layer and preferably at least partly embedded in the inner surface of the outer film layer. R is a substituted or unsubstituted straight chained hydrocarbyl group optionally comprising one or more amine, ammonium, ether, thioether or phenylene linking groups and Y is  $\text{H}$ , an amine,  $\text{NH}$ ,  $\text{NH}_2$ , halogen,  $\text{CF}_3$ , thiol, ammonium, alcohol,  $\text{COOH}$ ,  $\text{SO}_3\text{H}$ ,  $\text{SO}_3\text{H}$  or phosphonium group covalently bonded to the terminal position of R. The utility computing portal also supports access to application configuration, for example, allowing a manager to change the number of front end and backend physical/virtual machines available to various application roles.

1459828683-0a498566-bac2-4d64-b206-4481a9f11ff2

Apparatus and methods of ceasing operation of an electric power generating system improve the cold starting capability of the system. In another aspect, the invention relates to a method of searching for blocks modified in a tree structured file system. The invention also relates to plants and varieties produced by the method of essential derivation from plants of DLL1344 and to plants of DLL1344 reproduced by vegetative methods, including but not limited to tissue culture of regenerable cells or tissue from DLL1344. The system, in another aspect, includes a workflow flow chart associated with an information work and a control module that initiate usage by a user of the associated workflow flow chart in response to a request therefor from the user while the user is utilizing the respective information work.

1459828683-2970b325-70a3-42e2-8b14-bfd8d0cc01cb

Modified proteins are represented by the formula R-L-R, wherein R and R are peptides or pseudopeptides linked to one another by linkage L. proprietary inbred maize varieties. The safety layer allows for an increased level of safety in the IDM system and permits development of separate hardware and software upgrades with the safety layer assuring that compatibility between components will continue. The converter housing defines an internal passage that extends through the converter housing from the first opening to the second opening.

1459828683-a8bf283b-b859-49c5-a436-7f81ef948772

A surgical tool holder includes a flange comprising a body defining a first surface and a second surface, a first end and second end. Wiring patterns and protrusions are formed on a surface of a substrate with the wiring patterns extending on tops of the protrusions. At this hierarchical layer of the driver stack, the multipath driver functions at the command transport protocol level. The thickness of the back-plate may be greater than the thickness of the material supporting the anchor ring. The winder includes a pivot assist assembly to urge the winder to the closed position. The volume of gas bubbles is between 8 and 35 percent of the volume of the spheres on average, and the spheres exhibit good resistance to breakage upon exposure to high pressures such as may be encountered in polymer extrusion processes.

1459828683-ada558bc-3281-4156-a10f-9413b5126d99

In a controlling circuit, a photo coupler is used for isolating noises, and a general purpose amplifier is used for adjusting a gain, so that a logic tester may test analog signals in cooperation with relays having different specifications and operating voltage level differences in an analog measurement module. In addition, method of identifying or modulating nociceptive pain and associated disorders is also provided. The mobile station is operable to: receive the GPS signals; receive the combined GPS data via the terrestrial wireless communication; and generate positioning data from the mobile received GPS signals and the combined GPS data. In a preferred embodiment, the accelerator composition comprises zinc diethyldithiocarbamate, zinc 2-mercaptobenzothiazole and diphenyl guanidine, in conjunction with a stabilizer, such as sodium caseinate. A second controller is connected to receive the first control signal and to generate a second control signal which is applied to the first amplifier. The signal can also be processed to provide a display of the pumping load and/or to provide feedback for control of the flow of gas.

1459828684-24a6242e-b4f8-4ba1-8835-328f369e3214

An electronic device includes a first circuit, a second circuit, and a power on control circuit. The low voltage differential signaling driver has a programmable offset voltage and a programmable differential output voltage, which may be programmed independently. The messages within each group are sorted according to the time the message was generated by the information feed, and then are processed in the order in which they were generated. The shelves may be positioned just above

the bottom of the cart to provide a maximum depth cart for use, in intermediate positions for use with smaller objects and/or at the very top and/or side of the cart and locked in position to provide a secured interior for the cabinet. The setting mechanism controls the movement of the inertia acceptor driven by the energy of rotational inertia shifted from the developing device assembly.

1459828684-97e25e17-f2b4-4801-b30a-8a663c6585e5

A semiconductor device has a substrate, a first gate electrode, and a second gate electrode. The interface includes a touch screen display which displays one or more button icons. An etch stop layer is formed over the first semiconductor layer. A cylinder is in the first chamber. By rotating the dark-stripes relative to the displayed pixels, the spatial frequency at which the moiré effect sets in can be improved by 15% to 41%.

1459828684-b6370722-4ba6-41f7-94fb-9e45e6cb23f2

An image capturing apparatus includes an optical system that forms an image of light and a gradation processing section that converts gradation of a captured image captured through the optical system in accordance with a spatial frequency transfer characteristic of the optical system. The developer roller is configured to supply toner particles to the electrostatic latent image. The loading part removably accommodates the communication devices, and includes a first surface and a second surface, wherein the transmission medium can be connected to the communication devices through the first and second surfaces. An orifice assembly between a fluid accumulator and the centering unit prevent overly rapid off-center movements during tire blowouts.

1459828684-cb953bdb-d8f5-40a1-8d18-bcce69082579

There is a method for the mechanical disintegration of biogenic sewage sludge, for which the sewage sludge, in an initial state, has microorganisms in the form of cells and a solid, which is formed essentially from aggregates of cells and suspended materials, and for which a disintegration process causes a destruction of aggregates and a destruction of cells. The present utility model is available for fastening an article so as to avoid inconvenience brought to users by the article. The dielectric spacer ring, which surrounds the substrate support surface and which is surrounded by the edge ring in the radial direction, is configured to insulate the edge ring from the baseplate. The methods and systems provide an overview interface which allows a user to review and refine classification decisions in the context of the original sequence of photographs.

1459828685-12ecdd9e-d2b0-45b7-a46d-c1d036378d96

A method and apparatus prioritizing video information during coding and decoding. The load beam exhibits longitudinal asymmetry in regard to the weight distribution, but has a center of mass that lies along its longitudinal axis due to the provisioning of counterbalancing features, such as the addition of material, the removal of material, or a combination of adding material and removing material. A plurality of word lines are each electrically connected to the capacitor in each of the memory cells in a respective row. The method also includes selecting at least one of the access requirements, and storing the scrambled program and the selected requirement.

1459828685-34141a18-cdb1-4e27-91ae-dc561b652267

A method and apparatus for dynamically classifying TCP-based traffic, is presented herein. The tool is effective for increasing the longitudinal surface area for grinding across the edge of a stone slab. A memory gate of the memory transistor comprises an n-type polycrystal silicon film and is disposed on one of the side walls of the control gate. The one or more identified portions may be reassigned to the second host. The current velocity is compared to a stored target velocity, and audible or visible feedback is provided to the spray gun operator. Additionally, the office telephone and remote client may have connectivity devices coupled to

them so data from the connectivity devices can be viewed, managed and controlled at a remote location.

1459828685-b0dba431-4b13-4659-b4c1-3f8981fc33f5

A system and method for providing a common power detect and presence detect signal. The apparatus also includes an extended virtual function shell positioned on the PCIe configuration space and configured to select one of the physical functions, to select one of the available virtual function clusters and to associate the selected virtual function cluster with the selected the physical function. The device further includes a measuring circuit that measures a metric of the electrical signal to approximate a corresponding metric of an intrinsic electrical feature of the second chamber. deprotecting the protected polyol fluoropolyether derivative to yield the polyol fluoropolyether derivative. Write control circuitry, responsive to a control signal, supplies write signals to a selected memory cell to induce a change in the resistance of the nanotube fabric article, the resistance corresponding to an informational state of the memory cell. If a person wearing the breathing apparatus 1 inhales, the inhalation valve 8 is open and the exhalation valve 7 is closed.

1459828685-f8ecb5aa-606a-4e89-95fc-196f74bc8126

A handle knob to conduct an openingclosing operation of a front door is provided on an outer-face side of an outer panel, and a handle base to pivotally support the handle knob is provided on an inner-face side of the outer panel. Upon receiving a request to deliver data addressed to the mobile station, a node in a circuit-switched network of a mobile telecommunications system identifies whether the mobile station is capable of receiving data via a packet data bearer. The bump structure includes a body and a solder layer. The method can also include selectively skipping in a playback mode the commercial portion of the video signal responsive to the digital data identifying the event start information and the event end information.

1459828686-492d9681-2975-415f-ab3f-992f873cf226

Embodiments are directed towards determining within a digital camera whether a pixel belongs to a foreground or background segment within a given image by evaluating a ratio of derivative and deviation metrics in an area around each pixel in the image, or ratios of derivative metrics across a plurality of images. The latch has a latching portion. The composition is formulated according to the invention to provide a desired removal rate of the low-k dielectric and/or photoresist from the surface of the wafer.  $\theta$  eq, and an alkyl-modified silicone represented by formula below is blended as an ingredient, and a solid washing agent formed from the composition.

1459828686-4ff3db50-bf18-4683-8f6e-150204b56c1e

An elastic coupling is provided and has first and second coupling parts that are rotatable relative to one another and engage one another via elastomeric elements. Although complex forms and motions can be constructed either by hand or with motion or geometry capture technologies, once they are created, they are difficult to modify, particularly at runtime. After that, the memory read operations will stop, thereby reducing the power consumption caused by memory read operations. The first electrode layers are interdigitated with the second electrode layers, and insulating layers electrically isolate the first bus bar and electrode layers from the second bus bar and electrode layers. The system can efficiently operate in multi-user multi-channel communication systems. This stabilization eliminates or at least drastically reduces any distortions of the measurement results provoked by transversal accelerations.

1459828686-61cf93d1-bae0-4103-a6ab-3af773a7211c

An apparatus for improved reception of a signal is described. In an area including at least a centerline extending in a longitudinal direction of the absorbent

article, the surface sheet is corrugated to form recesses and ridges extending in the longitudinal direction and alternating with each other in a transverse direction perpendicular to the longitudinal direction. The battery controller can be provided with a unique serial number to be directly linked to the vehicle. At the encoder, both the input sample texture and information representing the displacement vectors are coded.

1459828686-a1bdcfd4-50fb-4ae5-b81b-6132adf99b03

A rolling bearing for belt-type continuously variable transmission with a metal belt including pieces has an inner ring; an outer ring; and rolling elements, wherein at least one of the inner ring, the outer ring and the rolling element is made of an iron alloy having a chromium content of from 2. In particular, the disclosure relates to pharmaceutical compositions containing an EGFR-inhibitory compound suitable for administration to treat Alzheimer's disease, as well as to related therapeutic methods. Also provided by the invention are tissue cultures of the soybean variety A1026505 and the plants regenerated therefrom.

1459828686-b9f183f3-e6d3-43bd-a791-9c11ba54bd30

A switchable roller finger follower is provided having an inner lever and two separate outer arms mounted at one end to a swing pivot axle that extends through the inner lever. The connecting conductor is adapted to wrap a first surface of the inductive component. The first piston hermetically fits into the first cylinder and moves upwards and downwards within the first cylinder. The interface device includes a first end for coupling to the host computer and a second end for coupling to the flash memory card, while supporting communication in the selected operating mode which is also supported by the host computer system.

1459828686-e37e460f-b53a-4a43-b84e-fb01977b3c40

A monitor system and method for characterizing semiconductor processes including ion implantation processes is provided. The assembly contains a conductor in contact with the biological tissue and forming an electrical circuit comprising the biological tissue. N is equal to a number of the gate driver chips arranged on the side of the LCD panel, as distance from the driving source of the driving voltages to the gate driver chip increases, absolute value of the driving voltage outputted by the compensation unit increases. The communications channel has a timing variable function to store timing variables and derive timing information associated with each individual transfer within a burst transaction during a simulation. The method includes using the data classifier to generate elements of result output data in response to elements of test input data, determining a measure of difference between each element of test output data and each corresponding element of result output data, forming a distribution function of the measures of differences, and forming a measure of performance from the distribution function.

1459828687-cec72931-759a-4dac-9386-ca35fffb8f5ce

A method and apparatus to ensure DLL locking at a minimum delay is provided. The belts have their upstream ends held by a pair of first rollers spaced apart on opposite sides of the bubble, and have their downstream ends held by a pair of nip rollers which hold the belts together to form a nip for the collapsed tube. The tap provides a pass through connection from the card to the host and taps off of the bus. The foreaft extending arm is provided with a slot that extends along the arm at an angle thereto.

1459828687-d8cab703-ce97-46b9-a0ed-041c69114f49

A down-the-hole drill hammer is provided that includes a housing, a solid core piston mounted within the housing, a seal located between the solid core piston and the housing, and a backhead configured to exhaust working fluid volumes about a proximal end of the DHD hammer. The invention relates to new access services for NBBS networks. The ecological board according to the present invention is durable,

stable, easy to construct, maintain, and repair, and environmentally friendly to the natural landscape. In another embodiment, the texturizing underlayer is in the form of surface dislocations composed of annealed first and second conductive metal layers, and the conductive metal overlayer is agglomerated onto the surface dislocations as nanostructures in the form of island clusters. On the emitter side of the oscillating transistor Q2, a resonance frequency in a resonant circuit having a capacitor C7 and the coil L3 is set near the center of a VCO oscillation frequency band, whereby it is possible to obtain the oscillation frequency which is not easily influenced by the noise.

1459828687-e5ebb310-8bcf-4257-8ec1-46baf6ce9809

A microarray chip manufacturing apparatus includes a plurality of picking pins which pick specific binding substances linearly or two-dimensionally arranged at first spaces and spot the specific binding substances onto a flat chip at second spaces narrower than the first spaces. The double coil spring has inner and outer portions. In addition, the filament forming process of the resistive memory device can be omitted due to the existence of the confined defects. The first and second supports are compatible such that the face member is attached and secured to the receiving surface. The lower end position is set to a position slightly above a bottom dead center of the entire vertically possible stroke of the ram.

1459828687-eaea34e7-57d1-49c6-9977-df0eb1debb1a

A drum-type washing machine is disclosed, in which bearings are received in the bearing housing assembly. The ceramic composition contains a mixture phase in which a first phase containing zinc oxide as a major component, and a second phase comprised of an oxide of Ca and Si are mixed. Transaction approval systems provide additional advantages. The at least one first coil is disposed within the first inner conduit. The hollow-fiber porous membrane obtained is excellent in mechanical strength represented by tensile strength and elongation at break and in chemical resistance.

1459828688-170a9f9e-a1ee-4a40-a751-59be44aa2d06

A telestrator system is disclosed that allows a broadcaster to annotate video during or after an event. The housing includes a receiving space in a side thereof for receiving at least one battery therein. Then, skew-feeding quantity of the sheet leading edge to be detected by the skew-feeding detection sensors 204a and 204b for correcting skew feeding of the next sheet is adjusted with skew-feeding quantity at the sheet trailing edge detected by the lateral-registration detection sensor 204c after positional deviation in the sheet width direction is corrected. Pixels associated with the at least one predefined region are converted from the first format to a second format, with reference to the component information of the at least one pre-defined region, to form the multi-format template image. Pouring concrete between the floor and the outer form to an upper portion of the outer form and allowing the concrete to set creating a second bearing surface substantially in-line with the upper portion of the outer form.

1459828688-7110403b-5e07-46b6-9d20-d0b2adefcd5f

The invention concerns an improved therapeutic regimen for the treatment of thrombolytic disorders, such as acute myocardial infarction. In this manner, the linear fastener system is capable of providing a precise, secure, and reproducible connection between multiple components without the need to apply rotational torque to the assembly. Some examples of information that may be displayed on the low-power display include personal customizations of the device, a battery meter, a signal strength meter, the date and time, or any other type of information. Alternatively, the additional lights provided by the integrated light frame and turn signal assembly provided additional warning to on-coming motorists that a motorcycle rider wishes to turn. The door further comprises a housing of polymeric material for electrical and/or electronic components of an user interface integral with the door, the housing being shell-shaped and being mounted on an internal face

of the external glass plate, above the internal glass plates. The user interface allows viewing and adjusting of the mix to be dispensed prior to the actual dispensing.

1459828688-c654c37e-a744-42b0-9281-97ff2a9a7dc8

An adjustable support structure for temporary sign displays formed from a vertically oriented rigid panel having a plurality of length and angle adjustable support arms. The object of the game being to make a good poker hand of cards being composed of players' individual cards in conjunction with community cards. The device can be removed by gripping a portion of the device with a retractor device, which is used to draw the device proximally. The invention is advantageously applied in EUV lithography for semiconductor chip fabrication. Multiple launch fibers may be incorporated within a tube. Pore characteristics suitable to target materials are controlled by adjusting pressure at a non-critical state without requiring additional processes or devices.

1459828689-56368053-6061-4b89-927d-fb4747bd1961

The present invention provides an apparatus and methods for the electrical detection of molecular interactions between a probe molecule and a protein or peptide target molecule, but without requiring the use of electrochemical or other reporters to obtain measurable signals. The second GaN epitaxial layer is coupled to the first GaN epitaxial layer. A main point is to perform oxygen radical treatment on a surface of a gate insulating layer. A third switch is connected at a first end to the first end of the capacitor and at a second end to the drain of the biasing transistor and a second ground.

1459828689-61066c51-6841-41b0-bf6d-7b666b9f98c1

The present disclosure provides compositions suitable for delivering lipophilic bioactive agents. The full-length sequence of Rabies Virus strain Evelyn-Rokitnicki-Abelseth is disclosed. In this way, it is possible to dispose the light emitting portion and the display section respectively in optimum locations, and to ensure freedom of disposing the display section in a position achieving fine user visibility.

1459828689-73d93989-e192-4d07-a782-a89173ea1f49

A system and method for controlling a converter of a power stage receiving an adapter current for providing current to a load. The first latch and the second latch behave as master and slave latches to one another. The pneumatic or hydraulic spring can herein be driven by the fluid for metering. The viewer adjusts the scheduled start and/or end recording times for a specific program or series of programs by specifying the time increment to add or subtract from the start and/or end recording times and the invention adjusts the recording schedule for the program using the padding values. After instructing the tactile sensation providing unit to execute the tactile sensation providing operation, the control unit controls the imaging unit to shorten the focal length if the contact area between the contact detection unit and the contacting object is less than the standard area and to extend the focal length if the contact area is equal to or greater than the standard area. An impurity concentration of a gate electrode of the n channel FET has an impurity concentration greater than an impurity concentration of the gate electrode of the p channel FET to thereby create a tensile stress in the direction of flow of a drain current in the channel forming region of the n channel FET.

1459828689-bdf3388c-438d-4ab6-a0e2-70d68b9d7983

A system and method for implementing dynamic end-to-end loss compensation in a VoIP communication system is provided. The core fulfillment system includes an interchange database with automotive core descriptions and corresponding interchange identification indicators. The body includes a lumen extending through the body from a proximal end to a distal end of the body; and an adjustable frame surrounding the lumen. The MES tracks viewing habits, enables the purchasing of

extended views of programs, and removes expired media programming content. If either of these two conditions are not satisfied, then the basic block is translated by the translator.

1459828689-ec30fb42-3e91-4218-87f4-1bde3845b032

A display device in which light leakage in a monitor element portion is prevented without increasing the number of steps and cost is provided. The method includes, determining a load-dynamics threshold, detecting an unloaded operating state of the internal combustion engine, detecting an incidence of the load-dynamics threshold being exceeded in the unloaded operating state, and retarding the ignition timing to form a load-dynamics aiming-off allowance that prevents combustion knock. A device is attached to the fuel rails which reduces movement of the fuel rails relative to the engine block and mechanical stress that would otherwise result from such movement.

1459828690-41064981-7f52-4fc3-851b-ddf2351454f5

A system and method for monitoring dropped packets are provided. The half-door provides a substitute to the costly modification of existing doors in childcare centers and pre-schools while being in compliance with laws and regulations. Consequently, the uniformity of the thickness of the whole film coated is improved. The receiver, when operating in a second mode, consumes more energy than the first mode and analyzes the RF energy to determine whether it contains the appropriate type of modulation. Rotation of the horizontal adjustment element adjusts a position of the panel leaf to any position between a third position and a fourth position.

1459828690-b15a4f59-dcb1-4cc7-b16a-b31b742cca1e

An MR scanner with a setting mechanism for patient-dependent control of the radio-frequency fields and magnetic fields for adhering to individual SAR and dBdt limits, has an optical measuring device containing a distance sensor for determining the surface of a patient and for determining a setting signal for the setting mechanism. Over the major fraction of the trailing edge, in zones where the temperature in operation is particularly high, the ends of the ribs are closer to the trailing edge and/or the sections of the ribs are greater. The processor can display simultaneously on the display a calendar image and the predetermined image. Stretcher handles seat in the stretcher holder and the secondary stretcher support. One or more of these may function as an additional emulsifier.

1459828690-d52e7424-6dec-4f45-8b1c-66a673d51391

Presently described are methods of surface treating inorganic oxide particles, hardenable compositions comprising a polymerizable resin composition and surface treated particles, as well as surface treated inorganic oxide particles, and silane surface treatment compounds. in a plane perpendicular to the optical axis; memorizing a second position of the measurement point on the rotated substrate with reference to the reference mark; measuring the position of the measurement light as a second measurement position; and detecting of the offset at the measurement point on the basis of the first and second measurement position. The z-cells of certain spatial objects are either duplicated or redistributed across multiple partitions in the database system to enable parallel joins of spatial objects. An LSP is set up based on the allocated label. The method also includes enabling a software entity to request a service represented in the repository, the service representing a first operation on one or more data elements in a first collection from the collections, and executing the first operation on the one or more data elements in the first collection.

1459828691-58a230db-c50e-4063-b927-b6bd5e0b729e

A plastic lens material comprising a compound in which a part or all of 1,4-cyclohexane dicarboxylate structural units are a cis structure; a production process of the material; a plastic lens composition containing the material; a

plastic lens obtained by curing the composition; and a production process of the plastic lens. The representation is searched to identify new resources that may be allocated and updated when new resources have been allocated. The method includes transmitting by a first site its certificate. A sound chip having a memory for storing audible messages is positioned in the housing along with a sound generator for audibilizing the messages when energized.

1459828691-7b425ad7-fef3-4d28-b866-2b80d353ecd2

An organic EL light-emitting device includes a substrate, thin films having a reflecting function formed on the substrate, an organic EL light-emitting layer, and upper electrodes. The ECC codewords may comprise ECC codeword symbols. For each of one or more image adaptation schemes, an objective measure of information fidelity is determined for a region R of the image.

1459828691-bc94cf07-ab7c-43fe-85d4-7bda076a2317

A cover mounted on a throttle body is provided with an intermediate connector to be connected to a motor terminal and an electronic control module. With this simple configuration, the dynamic range of the input image can be appropriately improved. , which are coupled to the speech processing facility via a communications channel, e. The example stroller includes a support having a first end and a second end, where the first end supports the intermediate wheel and the second end supports the rear wheel. The aforementioned continuous function is digitized, and the obtained digitized planar holographic pattern is used for converting the function fin into the function fout.

1459828691-fec72942-af1c-40e9-b2e8-f12b17b7f525

A voltage booster and regulator usable with Dickson-type charge pump device is specifically adapted to maintain efficiency with both high and low supply voltages. A preferred embodiment for depositing Cu barrier and seed layers on a semiconductor wafer comprises a front opening unified pod, a single wafer load lock chamber, a degas chamber, a preclean chamber, a Ta or TaN process chamber, and a Cu process chamber. The transformer selects an indicator word and makes forbidden prefix substitutions in the data to be transformed.

1459828692-d5b876a8-7adf-4fed-8538-1260525a4307

Methods for processing at least one die which comprises an integrated circuit. One end portion of the elastic member is fixed to the supporting member, and the other end portion is a free end portion whose tip edge is to be contacted with a member to be cleaned while rubbing the surface to remove a residual material therefrom. The outer and inner contours of the character to be recognized are approximated as a polygon, and straight line segments of the polygon are normalized and transformed into a tangent space to generate character curves. The microchip allows the user to select specific functions based on the time duration of activation signals, the time duration between activation signals and the number of activation signals at the input. Depending on the overall size of the system, many users may have simultaneous access to supercomputer level computational processing. A time period in which a quality of a pilot is measured is divided into multiple accumulation sections, a synchronization detection threshold value is set for each section, and a pilot BER calculated for each section and the synchronization detection threshold value set for each section are compared to judge synchronization detection.

1459828692-ebbb9a00-870a-494d-ab5c-e1975b83dbda

An aspect of the present invention is a method of forming a contact in a thin-film device. 6\xd710\u22123, as obtained from the BET specific surface area and the total molar amount of OH groups and CO groups at the surface obtained by a titration method. The integrator samples the comparison signal and converts the comparison signal into one-bit digital data. The center of a largest such shape is mapped back into the units of the original eye diagram as optimum sampling parameters for data analysis equipment that uses the receiver to sample the signal

once per unit interval to discover logical value. The filter elements are connected with at least one filter bracket to form at least one filter insert, and the filter insert is detachably connected to the filter housing.

1459828692-ff4b475b-1d56-49a9-ad8a-b7c12362db32

A method for creating a digital elevation map from frames of flash LIDAR data includes generating a first distance  $R_i$  from a first detector  $i$  to a first point on a surface  $S_i$ . An embodiment of the system comprises an adverse event detector to sense an adverse event and provide a signal indicative of the adverse event, and a baroreflex stimulator. The valve seat body has first and second pressure receiving faces having different pressure receiving areas and on which fluid pressure from an input port acts in opposite directions and a third pressure receiving face on which fluid pressure in the valve chamber acts. The mobile device can then use the password to access the protected information. The yoke has three marker points the upper two of which are maintained in a horizontal plane by a gravitational force urging the plumb bob into a vertical plane notwithstanding the handle not being held exactly horizontal. When assembled, the cover will cover the open face thereby avoiding direct exposure of the information on the card.

1459828693-0fdbbb01-276a-4a21-ba59-0eb544202349

The systems and methods describe a self healing framework that can monitor errors in a computing system and can resolve the errors and/or suggest methods for resolving the errors to a user based on a heuristic approach. The method may employ a frequency of between about 13. Distal end regions of the finger straps are attached together to form a finger strap assembly. The supplemental digital data may be audio data, visual data, or audio-visual data for presentation with the broadcast data. The captured information is indexed and stored for future access either on a terminal device or an accessible remote server device.

1459828693-1ed679e2-92d7-4f29-9b3d-980a52f400ee

A method for controlling one or more computer room air conditioning units configured to receive return air for energy efficient operation. A five-sided enclosure is provided for mounting one of several different types of electronic components. The invention further relates to genetic complements of plants of variety CH155784. Angle change points are included in each of the interleaved blocks which allows a reproducing apparatus to seamlessly jump from one angle to another angle during reproduction of the multi angle data. The cog tracks can be integrated into the structure of the slide-out sections, and the slide-out sections are supported against tipping down both upon extension and retraction by a cable system that exerts a counter-moment on them in both directions.

1459828693-f9e98eb4-cf6b-438f-821f-3c9a051c1b24

A grain size of a crystal grain in a crystalline semiconductor film obtained by a thermal crystallization method using a metallic element is reduced. Since the number of test vectors is increased in a SOC, the number of \u2018s is increased if adjacent test vectors are properly aligned using an ordering algorithm. The chuck includes an anvil portion and a peripheral upper anvil wall. The resulting circularly polarizing materials have reflection and transmission characteristics over bands of operation approaching 2000 nm. The signal processing circuit presents a first signal to the hearing aid receiver that is representative of the acoustic signals. In response, the international gateway creates a new response or alters the response, and transmits the new or altered response to the MSC-V.

1459828694-543c3690-a771-4700-9739-c66c1ef7898b

The present invention concerns the application of adsorption gas separation technologies to anaesthesia equipment and falls within the technical domains of adsorption separation units and medical devices. A symbol generator uses the higher dimensional signal constellation, or any orthogonal transformation of the higher

dimensional signal constellation, to translate a bit stream into a stream of higher dimensional symbols, which it then provides to a modulator. In the battery unit, the cathode plate, the separator, and the anode plate are sequentially and repeatedly stacked upon one another.

1459828694-5e42d101-100a-4c83-be82-ac741a23f214

A spatial CAM forward conversion unit forward-converts XYZ data of the input side into JCh data based on input viewing condition parameters including parameters, which are used to determine field sizes of an input image based on the viewing angle. The passage of the leading edge contacts against the inside of the semi-circle passage by the virtue of a first end of a spring engaging to a protrusion of the connecting portion and a second end of a spring engaging to a bulge of the guiding member. In addition, the clocked half-rail differential logic circuits are activated by a delayed clock and include a sense amplifier circuit that is triggered by a second delayed clock. The final autorefrigeration stage utilizes an antifreeze liquid that allows the final stage to operate below the freezing point of CO<sub>2</sub>; thus allowing more acid gas removal. The oxocarbocyclic compound-containing mixtures have advantageous musk aroma imparting, augmenting and enhancing perfumery properties causing the mixtures to be useful in perfume compositions, perfumed articles and perfumed polymers, including particles and fibers produced therefrom.

1459828694-69b5b260-5f59-4f7e-9561-d99c71ae82b1

A semiconductor device includes an N-type MOS transistor and a P-type MOS transistor. In exemplary embodiments, the keypad assembly is suitable for use in electronic devices such as a mobile telephones, calculators, hand-held computers, or the like, having single piece molded housings wherein the keypad assembly is at least partially encapsulated within the housing. The method may further include calculating a second orientation value based on a signal received from a second sensor. A compact cover may be wrapped over the protective covering adapted to contain any contaminants within the compact cover thereby preventing the contaminants polluting adjacent objects. Methods of making and using these compounds are also disclosed.

1459828694-a493eb4d-665a-41c0-9913-e8118b8643c1

The invention provides a crusher block assembly for a particulate size reduction system including a crusher block having an inboard face configured and adapted to cooperate with a swing hammer in a crusher chamber of a particulate size reduction system to crush particulate, and an outboard face for receiving an adjustment mechanism. A method of disposing of a molded resin object including a molded substrate containing a biodegradable resin, including a step of applying a coating material on a molded resin object which coating material contains a proliferation accelerating agent for accelerating proliferation of a microbe is also disclosed. The set of data measurements are representative of a plurality of parameters including a plurality of leading parameters. With the lid occupying the closed position, the free edges presented by the front faces respectively of the container and of the lid are separated one from the other by a given distance to create an opening partially exposing the breast piece of the frame, which in turn presents at least one window serving to reveal at least one portion of the coupon.

1459828694-c47a08bd-c0a8-46f4-b0e5-e4ae86ddf8a4

A method and apparatus for adding watermark data to an input signal is provided. The switch has a housing with a housing upper side and at least one fixing projection insertable into the mounting hole from the back side of the mounting plate. When the terminal plate 30 is mounted on the flange 24, an outer side surface of the terminal plate 30 is flush with a surface 21 of the casing in a portion where the opening is formed. The display controller is configured to display a image which indicates the pointer operating device is connected to the connecting module on a screen during a time period of the connection of the pointer operating device. Alternatively, the light detecting element detects ambient light

and the control circuit controls the conversion circuit based on comparison results to stop or enable outputting of the driving electric signal. A contact foot has a U-shaped foot end with two limbs and with a cutout in-between, an upper limb merging with the contact foot, and a lower limb being provided on that side which faces away from the housing.

1459828695-4aa371f2-80ac-4e6d-a98e-76a6461c2c05

An implantable infusion pump possesses operational functionality that is, at least in part, controlled by software operating in two processor ICs which are configured to perform some different and some duplicate functions. A C-plate having an oblique retardation of at least  $\frac{1}{4}$  with respect to a light beam inclined by at least  $30^\circ$  is disposed between at least two reflective circular polarizer layers whose selective reflection wavelength bands of polarized light overlapping each other. The connector includes a mechanism making it possible, when the connector is push-fitted onto a protrusion of a bone anchor member, to tighten the rods simultaneously in the two other orifices when a nut is screwed onto the protrusion. The first pulse generator is coupled to receive the reference frequency signal and is configured to generate a first pulse signal. At least two cables are provided which are in contact with opposite ends of a double arm that is mounted on the load accepting means about a substantially horizontal swivel pin.

1459828695-7661fc52-9cb4-4584-9378-ef711cbe09a5

A seismic survey system having remote acquisition modules for acquiring seismic signals and communicating with a central recording system via a network of cables, other RAMs, and line tap units, arranged in a matrix of receiver lines and base lines. Specifically, the methods relate to substantially preventing the formation of unwanted materials on an isolation valve fixture within a chemical vapor deposition reactor. The system includes at least one protective layer extending from the mass flow divider into the first chamber. Spacers are formed along sidewalls of the photoresist features. Traffic from a server originally directed to the failed firewall is then redirected to a functional firewall.

1459828695-9b78d447-f02b-4c8c-b607-d5d027676215

In one embodiment, a cold storage system for biological samples has one or more freezers, each freezer having one or racks, each rack receiving one or more boxes, each box receiving one or more sample containers. A service server in the system receives images collected by the devices and encodes the received images based at least partly on redundancy of the images. The intake structure is disposed between adjacent first and second stationary blades, on the side of the first stationary blade relative to a bisecting line between the two stationary blades. The nut has micro fans which drive the air flows and reduce the temperature to increase the life of use and the precision of positioning. The identification feature is separated from the port and confirms that the port is both suitable for flowing fluid at a rate of at least 1 mL/sec therethrough and suitable for accommodating a pressure within the reservoir of at least 35 psi.

1459828696-a61c9075-a792-45e2-8be3-1793f781eca7

A new family of crystalline aluminosilicate zeolitic compositions, UZM-35 compositions, has been synthesized. The system allows for the investigation of changes in the ink resulting from resistor firing. Modulation of the capacitance produces a signal representative of the input differential voltage.

1459828696-ae3d953b-956b-4539-9afd-20bc46da9bf5

A first diffused region is formed in a surface of a semiconductor substrate located under a gate electrode. The magnetic tape head comprises a cluster of thin film inductive or magnetoresistive readwrite elements, an I-block preferably made of a ceramic material, a U-bar also preferably made of a ceramic material, and a base preferably made of a ceramic or metal material. Also described is a device especially suitable for implementing this process. The skin adhesion apparatus also

includes a pump for supplying fluid into the tubular member. The system includes an arteriovenous graft having an arterial end and an opposite venous end with a first valve device positioned at the arterial end of the arteriovenous graft and a second valve device positioned at the venous end of the arteriovenous graft.

1459828696-bfeddb4f-15dd-4cae-9c6e-4840efbbdb3

A heart valve implant according to one embodiment may include a shaft extending generally along a longitudinal axis of the heart valve implant having at least one anchor configured to be coupled to a first end of the shaft. This measurement is performed by a kernel device driver that handles the IO for the system at lower layers, so the measurements are more accurate because the delays due to higher level processing are not included. The first enclosure and its components can be used for various applications, including those for either underground or pad-mounted switches, which for the latter case can have the first enclosure inside a second enclosure on a pad, and the second enclosure also contains other power and control elements of the system. Concentration of metal in the etchant bath is maintained by discharging some of the etchant bath. The brackets are both connected by a lag bolt which is made essentially inaccessible and out of sight. Additionally, pharmaceutical compositions comprising an SGLT2 inhibitor with a supply of carbohydrate or an inhibitor of uric acid synthesis or a supply of carbohydrate and an inhibitor of uric acid synthesis are provided in the instant invention and are provided for use in the inventive methods.

1459828697-6bce8df0-7631-468a-8cc5-0fbfb94f2d7b

An antireflection film having a low reflectance and giving non-tinged reflected light with a low cost, which comprises: a transparent substrate; and a low-refractive layer having a lower refractive index than said transparent substrate, wherein the antireflection film has an average specular reflectance of 0. The lane divider attachment includes a transverse pivot rod opening or recess disposed in alignment with the pivot rod openings in the module when the lane divider is installed. The sensor apparatus can be configured for optical communication with the length of optical waveguide so as to sense the backward propagating light propagated by the length of optical waveguide. The flow of communication in the communication link between the plurality of second cellular phones is compatible with the wireless local area network protocol.

1459828697-ee3ad047-50b5-4bb9-867b-7b36a3876874

In a finder optical system, a primary image is formed by an objective lens on a primary image formation face and is passed via a relay optical system to form a secondary image on a secondary image formation face. The pull-actuator includes a pull-tab, an arm or push rod, and a catch to couple to a pivot-arm actuator. At least one device measures a quantity associated with at least one of the lift arm assembly, the tilt linkage, and the work tool.  $\frac{5\lambda}{2DG}$  Where  $\lambda$  is the wavelength of the laser beam used for writing and reading, DG, is the depth of the grooves, WG is the width of the grooves, and WL is the width of lands formed on the substrate, and the wavelength  $\lambda$  is in the range of 380 to 450 nm. The display control unit controls the display device, and causes the display device to display the information for display when the information for display received by the information-for-display reception unit is directed to the user. The invention also includes an apparatus and a process for the continuous manufacture of the shingles of the invention.

1459828697-ff665b87-fdae-40da-b4ac-acf19c8128fd

A method is provided which includes providing a cooling apparatus which includes a door assembly coupled to the electronics rack at an inlet or air outlet side of the rack. The assembly includes a return postcard, two anchor portions disposed on either side of the postcard, printer track strips having a plurality of holes for engaging a printer, such as a dot matrix printer, and a hole capable of being sensed by another type of printer, such as a thermal printer. A client computer for

accessing a data feed includes a client computer configured to communicate with at least one data feed server that publishes a data feed. In this aspect, the method and system include associating an address for the destination with the second geographic area to allow selection of the route for the data packet based on the second geographic area and selecting the route based on a second geographic area. A fixing opening formed by perforating the wiring substrate in the thickness direction is disposed, and the wiring substrate and the support member are bonded together through an adhesive agent disposed inside the fixing opening.

1459828698-0c0a1695-ea6a-422a-81dd-e98ab69a4ef2

Compositions for coating food cans comprising a film-forming resin and an amine-terminated polyamide are disclosed. From among the symbols, a selection is received from a user. The Venturi plates are substantially parallel to one another and include corresponding segments configured to engage in each other. The filtering unit calculates an estimated value for the channel characteristics via filtering processing on the channel characteristics in accordance with the tap coefficients. The element features a planar portion intended to slide above, and parallel to, the labial side of the body and a flexible and elastic arm having a portion which is securable to the surface of two tie wings resulting on the same side in relation to the slot. In addition, methods for transplanting these cells into an animal are provided.

1459828698-171019f6-3fdd-446a-9cb7-bd45dddc5cc3

Digital broadcasting transmission and reception devices and methods thereof are provided. Further, a logic 0 of the write signal is associated with a state in which no electric charge exists in the capacitor to write the same write signal. A side surface of the casing closer to the ejecting port includes a generally vertical surface and an upper surface of the casing includes a generally horizontal surface. The configuration circuit tests a content of at least one of the registers and performs an operation in accordance with the result of the test. The oxide semiconductor may include a lanthanoid added to zinc oxide and may be used as a channel material of the TFT.

1459828698-1a64e193-ebbc-4cd1-9af2-df80f5101ddf

An electrical connector for connecting a sheet-like connection member includes an insulating housing provided with a plurality of conductive terminals, defining a pair of slot at opposite ends thereof. Each additional winding is fed through one or more multiple capacitors in opposite phase angle and opposite field directions from each respective main windings. Cardinality may be determined by estimation techniques.

1459828698-4ecdd972-b704-4bd1-a0c2-b1163056479d

The present invention relates to novel processes for preparing DPP-IV inhibitors having the structure of formula I, and pharmaceutically acceptable salt thereof, which are useful for treatment of Type 2 diabetes. The second transmission mechanism includes a driven wheel driven by the drive mechanism, a first swing member connected to the feeding mechanism and confronting the driven wheel, an eccentric pin projecting axially from the driven wheel and connected slidably to the first swing member. An external component of a cochlear implant system comprising a support for mounting to the ear of an recipient and an external signal transmitter coil wherein the signal transmitter coil is movably mounted to at least a portion of the support. The light emitting diode chip is connected to a lead frame of the substrate by a high electrical and heat conductive component thus the device needs no wire bonding.

1459828698-7b8894e4-5915-4b2e-ab11-c349eea9fa98

Provision of fabrication, construction, and/or assembly of a memory device including a two-terminal memory portion is described herein. When an access plan is created, the actual performance for executing the query using the access plan is determined

and compared to the performance specification for the query. A value is then calculated relating stimulus level to response, to allow the relative responsiveness of electrodes to be determined. Elastomers produced by the improved method according to the present invention are particularly useful in automotive applications requiring oil resistant compositions. It is possible to supply an electric power to the electrical conductor tracks, the electrical conductor tracks preferably being used to heat the first dielectric member, and the electrical conductor tracks being made of a material having a pronounced, positive temperature coefficient. The memorial structure is associated with a deceased individual.

1459828698-f490ad9e-6d86-4d8e-976a-aff018092e7b

In various embodiments, a system and related method for organizing transactional data from a diverse and heterogeneous application environment is disclosed. The spacing or pitch between the beams at the optical recording medium is uniform. The guide vanes can have a curved configuration. A dummy picture is encoded data in which all the blocks refer to the same picture, motion vectors of all the blocks are zero, and none of the blocks has prediction residual information. The device empowers an importer/exporter, or really any small business engaged in long distance shipment of goods, to control in-transit, real-time status and location information for their cargo without relying on third party sources, such as transportation carriers, to provide such data or to pay their service fees. The binding system can also include at least one compression member mated to the base plate and/or to a snowboard.

1459828699-7dfef179-48c3-4161-be37-9da6105e160e

A process for alkylating aromatics is provided which comprises contacting an aromatic-containing feed with alkylating agent in the presence of a silica-bound ZSM-5 zeolite catalyst, wherein the ZSM-5 has a crystal size no greater than 0. The independent data streams include a video stream and a metadata stream. To clean off mixture 50 stuck to the whisk 46 the whisk wiper 30 is simply pulled off, the opposed edges of each slit 32 wiping the loops 44 clean, the removed mixture 50 collected on the top side of the whisk wiper 30 so it can be then returned to the mixing bowl 52. The controller receives a first flux signal related to the first magnetic flux and a second flux signal related to the second magnetic flux, analyzes the first flux signal to identify a first peak magnetic flux, and analyzes the second flux signal to identify a second peak magnetic flux.

1459828699-85013d1e-ffbc-422e-b9d5-9f34d5cdec31

An injection molding system for molding a hollow plastic article employs a hollow mold core having a longitudinal axis and a core runner cavity that has a uniform cross section throughout and which extends to the open end of the mold core. A generic metadata container is presented that allows object metadata to be described in an extensible manner using protocol-neutral and platform-independent methodologies. A pad fluid may first be introduced into the formation, the pad fluid containing a gaseous fluid and, optionally, an aqueous fluid. For example, the chamber controller can select a process recipe depending upon the signal values.

1459828699-a12be3a5-5a23-44fc-a150-e7ba70c5c88f

A metallic colloidal solution includes a water-based dispersion medium that is easy in handling with regard to safety and environment and metallic particles having a uniform particle diameter and being excellent in properties such as conductivity and has properties suitable for various printing methods and ink-applying methods. A main body of the apparatus processes first digital data, an interface receives, from an external device independent of the main body, second digital data having a sampling rate asynchronous with and different from a sampling rate of the first digital data, the first and second digital data being reproduced by the main body. The plurality of fractures is spaced to maximize interference between the fractures and enhances the production of gas from the coal seam of the subterranean

formation. For example, in one game a Game Master selects any of the rods except the rod having unit length and places it upon a game playing surface. The intermediate layer is formed from a second polymer comprising an acid group fully-neutralized by a salt of an organic acid, a cation source, or a suitable base of the organic acid.

1459828699-d9068b6d-b1aa-4938-a805-44a657fcb6f7

A method of determining CPS data in an OFDM-based, wireless communication system resolves the phase angle difference between training tones in a burst without CPS data and training tones in a burst with CPS data and then demodulates the resulting difference phase angles to determine the CPS data. A lever in the palm grip applies tension to a cable to compress a plug at the end of the upper shaft portion to frictionally engage the lower shaft portion. The amplifier circuit according to embodiment of the present invention may prevent thermal runaway, remove a harmonic component from an input signal to be amplified and suppress oscillations. A bias voltage to be input to the clamp NMOS transistor can be set high and the drain voltage of the memory cell can also be high, and hence a current value of the memory cell becomes larger and speed of sensing a current of a sense amplifier circuit is improved.

1459828700-644a886d-b4d9-4e8b-b8bb-919048201929

A kinetic child restraint device which is fastened to or integrated into the seat of a vehicle to provide for 360 degree spherical impact protection to significantly reduce the risk of injury to a child in the event of a collision. Seating loads are borne on the support surface from the weight of an occupant by elastic deformation of the bladder. The primary parameters to be measured include fluidparticle concentration, fluidparticle mixture volumetric flow, and particle size.

1459828700-771fffea-c3e1-4393-aec4-a230e665729a

The invention concerns a plate for fuel cell, in particular of the ion-exchange membrane type, comprising supply channels connected to an intake orifice arranged in the center of one of the surfaces of the plate, and discharge channels wherein circulate respectively a reactive fluid stream with relatively high concentration and a reactive fluid stream with relatively low concentration. The contact area is arranged to be stationary with respect to the base body and has an identical electrical potential at every point of the contact area. Whenever a new set of processes arrives in the system, the system schedules their execution in two phases: a pre-run-time phase performed by a pre-run-time scheduler, and a run-time scheduler phase performed by a run-time scheduler. Thus, saving power during operation of any associated circuitry, and ensuring that there is no loss of the data should there be a temporary power shut down. It is proposed to regulate the starting power of the motor vehicle as function of a driver's wish, via a slip clutch or brake mounted in the transmission, taking into account parameters of the torque converter and/or hydrodynamic clutch. The wheel-holding plate comprises a holding edge for pressing down on and holding the wheel.

1459828700-985b7bfb-85d3-4f6f-a09d-56caa6ab24ec

Processes for manufacturing touch sensors with one or more guard traces to reduce the effect of moisture damage are provided. The method also includes determining whether the first database query includes an aggregation function. Alternatively, the death benefit payment amount of the purchased life insurance policy may exceed, or greatly exceed, the annuity premiums for the annuity contracts. The establishing of trust parameters includes identifying the trust parameters and quantifying the trust parameters. At least one of the electrical conductors may include an electrically resistive ferromagnetic material.

1459828701-1b53aaaa-eea4-4bef-858d-58a741d9fe0e

A code is provided for transmission. During ground operations, an anti-re-ingestion door is open and a ram air door is closed such that the fan system may draw

relatively cooler air from below the aircraft and exhaust the heated air above the aircraft to minimize re-ingestion of the heated exhaust. Communication is prevented from being interrupted when communication route information is updated, and from being invaded on a communication route in the network. This maintenance protocol includes operations such as client software that is self-updating in response to server changes and the capability of reconciling client usage logs with service provider invoicing.

1459828701-c23e5b98-a98d-44a9-979a-195efae4246e

In a test system for a semiconductor device, the device under test is remotely located relative to the tester that generates the test vector signals. A novel approach is presented for updating the bit metrics employed when performing iterative decoding of LDPC coded signals. The driving circuit includes a plurality of sub-circuits. The characters are able to be generated on a conventional general purpose computer.

1459828702-48bdedf6-efa8-4bf8-84a1-ee43c412fad7

A keyboard scanning circuit, comprising N wires, and +N switches divided into two switch groups, wherein N is a natural number. The congestion of customers is evaluated by counting per unit time the count of an entrance switch when a customer enters the hall. A current video frame is divided into a plurality of elements and the foreground regions and background regions are detected. A defect on the integrated circuit wafer is then located.

1459828703-6d0377e9-8c74-40e8-8e16-1b643a06b931

An enhanced Node B and method for interference mitigation at a cell edge region in a Long Term Evolution wireless network are provided. In said units, air intake is open by a piston when said piston is in the rear position thereof in the space of a vacuumed cylinder which is switched for generating a superpressure, thereby initiating the outflow of a tissue liquid by the air introduced into the space of the vacuumed cylinder. A hard wire brush is affixed to the inner surface of the first tubular portion, and a hard wire brush is affixed to the inner surface of the second tubular portion. In accordance with another aspect of the invention, the second encoding scheme entails a long-term prediction mode for encoding the pitch on a sub-frame by sub-frame basis. The vegetation is vigorous and good disease resistance to Blackspot and Powdery Mildew has been observed during observation to date.

1459828703-ba129cfd-831c-46c6-b592-1eaee86e5fd9

A pre-loaded spring mechanism includes a piezoelectric device and a pre-loaded spring operatively connected to the device. An upper portion of the silo is closed by a domed top. The armature 7b is formed by depositing the armature material on a temporary layer, which is then removed. The first navigation information includes a file name of the audio data, and the second navigation information is provided by a playlist of the playlist. The select gate line connects commonly the gates of the second MOS transistors in the same row.

1459828704-24333163-3fbe-42a3-9c6f-02a03058d254

A bicycle shifter includes a base having an annular space and first teeth and second teeth defined in the annular space. The toner image conveyer unit includes a toner image conveyer, a supporting member that detachably supports the toner image conveyer, and a detecting member that detects a toner image on the toner image conveyer. The large-diameter passage is formed on the opening side of the fluid passage and connected to the small-diameter passage. By applying the optimized blend, material and labor costs associated with well operation can be significantly reduced.

1459828704-aba5f127-a731-4c20-8442-3b9911cfde24

In general, this disclosure is directed to decoding techniques for interpolating

video frames. The methods include catalyst handling steps such as catalyst loading into a slurry phase reactor, slurry phase reactor start-up, slurry phase reactor shut-down, and slurry phase reactor unloading when catalyst reloading is envisaged. The apparatus can provide RF signals to multiple antenna elements, which can be implemented in systems such as beamforming systems or multiple input multiple output systems. Thereafter, faces within the raw image are detected, by performing face detecting processes on the green signal image.

1459828704-df1a93ce-d1fd-43b5-ac6c-4a5959fef870

A method is described by which digital data can be sent between mobile phones concurrent with speech during a same phone call. The bulkhead has a first side facing a first compartment and a second side facing the second compartment. A large number of materials are held on the proprietary server 121 and read out from it. The light guide tube captures the lights that exit the second end and reflecting the lights downward illuminating at least a portion of a keyboard of the computer system. nicotinamide or niacinamide for the systemic treatment of various forms of itching, such as, e.

1459828705-3b5c59ab-257c-4bc1-95dd-262c82c32202

A processing device may automatically provide protective services and may provide backup services for backing up and restoring user files, system files, configuration files, as well as other information. Each of the protuberances has a curved outer contour, and protrudes from a lower surface of the support member on opposite sides of a latitudinal midline thereof, the latitudinal midline being halfway between a calcaneus support portion and a phalanges support portion of the support member. For example, a Bi layer is formed on the first sealing frame and an Au layer is formed on the second sealing frame, and then the first sealing frame and the second sealing frame are heated at a temperature of 300\xb0 C.

1459828705-4b94cf81-88b5-4214-abf8-9ba685df2390

A two stage toilet tank bowl control system includes a tank ball selectively positioned on the valve seat in the water tank. The pump assembly includes a pump; a tube having a first end attached to the pump for drawing contents therein when the pump is actuated; and an extractor positioned on the tube and configured to remove contents from the bottom of the bottle. Then, the adhesive mixture is dispersed in a controlled pre-determined weight ratio on the support surface where the mixture sticks to the support surface, cools and solidifies. The methods further include determining a distance between the corresponding pure gray color value and a selected color value. A first current channel is above a buried p-type diffusion and a second one current channel is below the buried p-type diffusion.

1459828705-75b9040f-49f9-4e23-8ca9-c83c4206c1bc

This invention concerns a device for the determination of air content, the air separation behavior and the surface foam formation of oils, in particular of transmission oils with an air-oil mixer and a differential pressures sensor. The data logger senses and stores data when a primary power source has failed. Thus, the lamps are hidden in the holding trenches to not badly affect appearance of the tent.

1459828705-a578078a-5896-437e-a091-e308ba1fe47d

Laminates, which are used for cooling the discharge vessel, are fitted to the seals of the ceramic discharge vessel. In this way, the terminal itself does not need to calculate the current position, thus reducing computational burden on the terminal, which facilitates achieving of fast navigation of the terminal. The partition element forms at least one accommodating room between the first and the second substrates. The deaeration is achieved under a predetermined reduced pressure, for example, of not more than 100 torr. , in rice, cereals, wheat, barley, oats, rye, sorghum, corn or maize, sugarcane, sunflower, oilseed rape, canola, sugar beet, soybean, cotton, pineapple, vegetables, pastures, grasslands, rangelands,

fallowland, turf, tree and vine orchards, aquatics, plantation crop, industrial vegetation management or rights of way.

1459828705-f486a57a-2e7d-4688-982e-1c404070c2d1

A polished glass disk is prepared for a magnetically recordable coating by texturing the surfaces with a highly abrasive material being abrasively engaged with the surfaces as the disk is rotated, thereby creating a relatively coarse texture with the abrasions concentric with the axis of rotation of the disk. The present invention also relates to flexible photoelectric conversion devices, which are based on ionic liquid electrolytes or organic charge transporting materials. The method also includes forming shallow trench isolations in the diode array region and in the peripheral region along a second line direction.

1459828706-16f91565-6fa5-4c29-85bf-06c27a134ffd

A method for producing a family of digital integrated circuit designs, where the family has a highest level design and at least one lower level design. The sensor measures a light characteristic at a first location, and provides data to a remote lighting component, such as via a wireless connection. The receiver computes a hash of the encrypted file, and sends it to a trusted third party. The assembly also includes a device for moving the movable plate relative to the actuator, and the movable plate and the fixed support respectively have at least one positioning member and at least one positioning component which interact to position the movable plate relative to the fixed support when the movable plate is in the first position. A corresponding method of manufacturing is also disclosed. The disclosure sets out methods applicable with fiber optic sensors either in a deployed in a loop and in a linear configuration and useful for measurements including temperature.

1459828706-512fa386-1a55-438c-82bc-68a26d00471f

An integrated device provides functionality of both a PDA and cellular telephone. A detector of equalizer dynamic adaptation logic compares equalizer output signals to desired values that are based on the decoding scheme to sense equalizer output signals that are offset from at least one desired value, and signals the fact of each offset and its polarity as amplitude independent error signals. To eliminate the disturbances caused by the dual mass flywheel a state model constantly determines rotation speeds of the input part and of the output part and depending on a differential angle determined from the rotation speeds and from the characteristic numbers of the damping device, a characteristic disturbance torque for influencing at least the load torque is determined in real time. The apparatus may determine that the plurality of tokens does not comprise the at least one token and determine, in response to the determination that the plurality of tokens does not comprise the at least one token, that access to the resource should be denied.

1459828707-0a2c6113-509c-457b-98ce-cc7b35c6021f

The present invention relates to a method and system for determining devices connected to a private network through a gateway. It enables the rotation speed of a motor of the electric oil pump to be controlled by a motor control unit or a underdrive brake to be controlled in onoff mode or in slip mode by the automatic transmission control unit until a mechanical oil pump is driven, in the event of a failure of the oil pump control unit or the electric oil pump. The improved SOG also efficiently utilizes the reactants and produces a O<sub>2</sub> stream that is largely free of chlorine and water vapor contamination and therefore does not require a BHP regeneration system or a water vapor trap. In order to make the exposure head as light as possible, after the light beam has emerged from the light source substantially parallel to the surface to be exposed, the light beam is deflected through a gaseous medium toward the exposure head and there should be reflected onto the surface.

1459828707-34cb6112-a937-4cc5-b7d7-1a8b7a29659a

The invention relates to a hydraulic steering system architecture comprising at least one steering control actuator having chambers connected to the outlets of a directional-control valve, an accumulator, and an electrically-driven pump unit associated with an emergency supply. At least a portion of each individual identification number is used to indicate the presence of each of the transfer processes. A particular new boot image is also selected, and that boot image is tailored to operate a maintenance or diagnostic function on the target machine. Also, body bias levels can be set and applied separately for a chip, plane, block and/or page. Light transmitted by or reflected from the transparent part 105 is detected, thereby the transparent part 105 can be used as a register mark for detecting the position of the mesh part 103.

1459828708-575766ed-bb61-4a19-b508-d8d095ea1f50

A method of operating a split-key cryptographic system having two or more co-operating microprocessors, i, linked via a communications channel, involving the generation of a public modulus,  $N$ , being the multiple of two integers,  $P, Q$ , where  $P \nmid P+1$  and  $Q \nmid Q+1$ . A tubular body is included to penetrate through a tank that is sealed while accommodating a high-voltage assembly and an X-ray tube assembly and having an insulating oil poured thereinto. The seal is arranged in close proximity to a seal land of a second turbine structure for preventing a fluid from leaking past the seal and seal land.

1459828708-76859563-7d1b-4852-9f64-c70c79ad1309

A hood device 10 is provided for a two-dimensionally-scanning camera 20. The electronic circuit also includes a logic interconnection circuit for performing the following functions if the chaining command signal is in a second state. A sample gas flow is provided to the gas sensor through the outlet tube to isolate the sensor from the heat of the oven and a filter device is located in the outlet tube for filtering the sample gas flow. In addition to physical storage and security, the invention also provides electronic storage for computer files such as electronic files, documents, photos and the like via an integral computer connector. The plurality of slanted ridges extends from the stem. Therefore, the hydraulic piping is connected from a hydraulic pump arranged within the vehicle body frame to left-hand and right-hand crawler driving hydraulic motors respectively attached to one-end sides of left-hand and right-hand crawler track frames arranged on left-hand and right-hand outsides of the vehicle body frame.

1459828708-d0982ab1-5fec-4fc6-a590-efaf3df40ee3

A disposable diaper including an ink-printed substrate web exhibiting ink rub-off resistance. The method includes mixing an alcohol and a catalyst to form a first mixture. By the present invention, the need for wire bonding of vertical multi-layer capacitors is eliminated. In yet another form, at least certain of the machine tools are movable parallel to the work-holding conveyor so that they may be predeterminedly moved prior to and/or during operations on work. The floating gate layer is etched until the substrate isolation regions are exposed and the floating layer is removed from over at least a portion of the select gate lines.

1459828708-e2df9a98-b9ab-49c2-bcfa-f9cb32267bce

A noise reduction system includes a driving device, a sensing device, a first switch, a second switch, and a controller. The tear-away energy absorbing webbing has a top layer load-bearing web and a bottom layer load-bearing web. The inflatable separation device includes an inflatable support frame and a cover that envelops the support frame and forms an enclosed interior space when the support frame is inflated. The blocking capacitor is selected to substantially increase an amplitude ratio of the down-converted signal to the amplified receive signal to substantially increase the front-end gain of the receiver. Sensor can be fabricated with substantially optimized sensor volumes to generate a response having a substantially maximized signal to noise ratio upon introduction of a fluid containing one or more target analytes.

1459828709-84e9d540-dd6a-477e-8b89-0b99eff131d8

A wireless communications adapter adapted for connection to a direct audio input of a hearing assistance device, the wireless communications adapter adapted for radio frequency communications with a remote device. In particular, by examining the expression these markers, one can accurately classify a glioma as glioblastoma multiforme, anaplastic astrocytoma, anaplastic oligodendroglioma or oligodendroglioma. The probe has two electrically separated plate conductors with a dielectric which forms a capacitor plane. A thermally insulating material is provided between the first portion of the apparatus and the heat sink. It further relates to a process for preparing the polymers and devices that are made with the polymers. The two n-channel FETs that form the differential pair are approximately equal in size.

1459828709-8b6ee86f-1e51-4888-81fb-6480f7fd684e

A photosensitive composition comprising a resin containing a repeating unit corresponding to a monomer having a structure represented by formula defined in the specification, and a negative working lithographic printing plate having a negative working photosensitive layer comprising the above-described photosensitive composition. A spool which transitions to a cone is situated within the cartridge. The received data is aggregated and analyzed, for example through statistical profiling. Each of the first and second fitting members has a threaded portion on an interior sidewall thereof. Finally, at least one passage provides fluid communication between the gauge and one of the bore of the body and the borehole. Convection losses associated with different temperature profiles in the pulse tubes and regenerators are minimized by shifting the thermal patterns in the pulse tubes relative to the regenerators by one or more of spacers in the regenerators, physical differences in length with gas channel connections, adjustment of dc flow, and thermal bridges.

1459828710-2a058258-128c-4ac4-9295-dbeea6a5a54e

A fuel cell plate having a first plate having an inlet aperture and a second plate disposed against the first forming a conduit. The yoke includes adjustment mechanisms to accommodate a wide variety of sizes of lighting fixtures. The releasable locking assembly has, for example, a first assembly movably coupled to the frame, a second assembly movably coupled to the frame, and wherein movement of the frame relative to the first and second assemblies causes the first and second assemblies to engage each other to limit further movement of the frame in at least a first direction. A multiplex control signal generator inputs an initialization signal into a Viterbi decoder at a timing at which decoding of individual data streams is started based on the received post signal. One of the electrically conducting connection through the interconnection substrate is a grounding path for the power amplifier, while a thermal path is provided by the semiconductor material.

1459828710-2b7d0776-30b9-42ad-b151-af2e5be0973c

A surgical stapling instrument comprising a handle assembly having a proximal end, an elongated body portion extending distally from the handle assembly, a head portion disposed adjacent a distal portion of the elongated body portion and including an anvil assembly and a shell assembly. The sonic fine-hole forming apparatus is adapted to generate a sonic oscillation driving signal comprises a voltage waveform which has positive and negative voltage portions being asymmetrical, and a sharp peak portion. In response to retrieval of inventory status information for the items indicated by the estimation data stored in the shopping DB system, the shopping server updates the estimation data concerned in accordance with the retrieved inventory status information. The spring contact defines a flexible curvature along a length of the spring contact, and the printed circuit board connects to the jack assembly at a pivot point allowing for angular rotation of the printed circuit board within the cavity.

1459828710-809882bd-2ba1-40b3-afcc-2c6ffa238e82

A double oven crystal oscillator is disclosed which is highly stable by incorporating means to reduce the effects of ambient pressure changes on the frequency of the oscillator. The air cap and fluid cap include inner surfaces that cooperate to define a diaphragm chamber in which the diaphragm moves between a withdrawn deformed position and an extended deformed position. A transmission order is determined based on bit reversals of the sequence numbers. The x-ray tube can be mounted in a manner that it can pivot, allowing it to move and align itself. Each hash value uses the first random number, the second random number and at least one part of a key of the tag as inputs. This structure provides an impact and tear resistant laminate.

1459828710-b5b1c898-69fd-454b-a990-ff5357d29f95

Disclosed is a method of fabricating carbon nanotubes and carbon nano particles, the method comprising: providing a plurality of carbon micro carriers on a silicon substrate; forming a plurality of carbon nano particles on the carbon micro carrier by a first gas; and reacting with a second gas to provide a plurality of carbon nanotubes. The service location has a server with a first periodically changing random code that is correlated with actual time. A lampholder has lower and upper tongues positioned to snap fit into the first and second slots, respectively, and mounts a circuit board which carries one or more LEDs. Such dielectric layers are useful in the forming of a variety of semiconductor devices such as transistors, capacitors and the like where such devices and integrated circuits formed from such devices are encompassed by embodiments in accordance with the present invention. In an initial state after the mode information is stored in the respective storage units, the control logic activates the write enable signals and the read enable signals of the respective banks regardless of the mode information stored in the respective storage units.

1459828711-0171bec4-b27c-446f-b00f-e7e932eb1e23

An object of the present invention is to provide a industrially appropriate method for producing the \u03b2-anomers of ribofuranose derivatives in a highly selective manner at a high yield. The probe system is configured to operate in an inspection mode and a measurement mode. The method is capable of preparing the organosilicon compound having a minimal chlorine content. The genome of the cell contains a second recombination site and recombination between the first and second recombination sites is facilitated by the site-specific, uni-directional recombinase. The local data interface also exchanges at least a second subset of the status data with the paired bearer processor through the local user data network. A wide variety of units may be constructed having different numbers and arrangements of primary elements.

1459828711-5c0f6b6b-c153-4372-a8bf-254b78c1a9e1

A method of injecting oxygen into a melt located within a metallurgical furnace having a heated furnace atmosphere in which oxygen and fuel is injected into 1 or more nozzles having passageways of converging-diverging configuration under choked flow conditions to produce supersonic jet or jets discharged from the passageways. The method comprises generating channel estimates for the received signal, computing filter weights for an equalizer based on said channel estimates and a covariance of the channel estimation error, and filtering the received signal using the computed filter weights. For digital linescan cameras, constant resolution of the image avoids scanning objects at different line rates for different depths of objects being scanned, thus maximizing speed of the objects and, hence, throughput.

1459828711-a7f98997-67de-4664-ab94-98285ed5f8ef

A window surround molding is secured on a vehicle door flange with a retainer clip. The visual tracking system is integrated with a 6 DOF motion stage to realize an ultra precision six-axis visual servo control system. The web screen obtaining

section obtains information about a web screen by making a request to a web server. This invention allows clients to interact over a network in a fashion that is anonymous and unique to the session which the client is engaging in. The usefulness of this invention includes physical product distribution through a shipping and handling system. Other embodiments are described and claimed.

1459828711-e4a9c7ac-37d2-4e07-97e0-f48f471e2448

A horn switch for a vehicle steering wheel includes a frame for mounting to the steering wheel. The disclosed blister sealer comprises a lightweight, tubular frame, detachable legs and a lightweight, modular turntable. 9, comprising at least polypropylene and high-density polyethylene, a second surface having a cling force to the first surface at least greater than about 5 gin, comprising at least a styrenic block copolymer, and a core layer, positioned between the first surface and the second surface, comprising at least linear low-density polyethylene or its blend. One blow mold is assigned to each blowing and calibration mandrel.

1459828712-3b18a8d6-8bd1-4641-8313-3a311e8593a1

To provide a manufacturing method of a semiconductor device for forming a diffusion layer by diffusing phosphorus atoms on a surface of a silicon substrate on which resist is applied, including the step of forming a diffusion layer, with a temperature of the silicon substrate maintained lower than a deterioration temperature of the resist. A tooth can include a pocket with at least one side wall which has an insert-receiving recess and generally planar insert-engaging interface surfaces formed therein, with one interface surface resisting rotation of the tooth about a longitudinal axis in one direction, and another interface surface resisting rotation of the tooth about the longitudinal axis in an opposite direction. Prior to forming the silicon oxide film, the silicon region may be treated in a plasma atmosphere containing oxygen and hydrogen chloride or a chlorine-containing hydrocarbon. The correction word is output from the PLD, which is powered-down, and is stored with the encrypted configuration data in the storage device.

1459828712-61d6ac5c-845b-4aac-87b7-f5cc3b724361

A system is provided for managing torque in a vehicle driveline coupled to an internal combustion engine and to a hybrid motorgenerator. The information display system includes a display connected to a controller and a network interface. The invention further provides methods of modulating cellular proliferation by modulating the activity of tubulin deacetylase. In particular, the scheme can be used in the domain of remote controls.

1459828712-7edd64be-d69d-478f-b691-e7280a985d44

Hypergolic fuel propulsion systems contain a fuel composition and an oxidizer composition. The compositions comprise oligonucleotides, targeted to nucleic acid encoding HIF1-beta. In each of the four structural states, the mobile communication terminal automatically allocates operations modes of camera mode and non-camera mode. The improved conductivity reduces the amount of nonactive material that needs to be added, thus improving the volumetric energy density. The period displacement SOCp to be applied to the pulse start time of the pilot injection command pulse Cpp, with respect to the top dead centre T7, is set to a timing that is advanced by the interval period Tint, pilot injection end delay period Tdpe and injection pulse width Pwp for pilot injection, with respect to the main injection start time T6.

1459828712-88087348-13e8-4b40-a0c5-3d9f8a2dd679

A shoring box having frame supports coupled to lateral spreader bars. Three techniques of compensation usable singly or in combination are provided which may be used in combination with techniques for dynamic range reduction for extreme compression. The aft-body, which is attached to the return portion of the face component, is selected from a plurality of aft-bodies, each having a different center of gravity location. Once the cutting blade passes along the length of the bobbin drum in one direction, the cutting blade may be rotated such that the sharp

edge may engage and penetrate the remnant material in the reverse direction. The advantage is that less turbulence is created by the blades, resulting in reduced noise and greater efficiency.

1459828712-a549a38c-052e-4d69-bba9-e8af834d5c15

The inventive circuit and corresponding method are used to form a universal reference cycle interface for any synchronous source, whereby compensation processes and level compensations adaptively occur at decision thresholds. The collision detection sensor has the optical fiber, a molding material formed on the periphery of the optical fiber, and a convex portion formed on the surface of the molding material. The rotary vane pump also includes a plurality of strengthening members, each strengthening member disposed in one of the plurality of slots and coupled to adjacent dividing members. 2-Deoxy-2-D-glucose and heparin sodium alter the surface interaction between the herpes virus and the cell, preventing fusion and infectivity.

1459828713-02d7f19a-e176-4b70-b636-58bf36755843

Disclosed is an MPEG portable sound reproducing system and a method for reproducing sound data compressed using the MPEG method. An OLT manages an electric state of each ONU connected to a PON. The document may be transformed into a second format different from the first format.

1459828713-1ee59e60-6b9f-44ea-9469-abb5616752f8

A valve assembly for an oil pumping system including a shell, a seat affixed in a lower end of the shell, a ball positioned within the shell and having a diameter greater than a diameter of the seat, and a cage positioned within the interior passageway of the shell. The stent includes a generally tubular body having a lumen defined therethrough. The concentration is further determined and adjusted at new fills and/or during laser operation based on its effect on the output pulse energy in view of constraints and/or aging on the discharge circuit and/or other components of the laser system. This avoids problems associated with circuit density within the structure of a backplane.

1459828713-58166e8c-4f88-47b7-ba8f-212e013b3a90

Novel methods and compositions for treating aged and environmentally damaged skin are disclosed which provide improvements in the skin's visual appearance, function and clinical/biophysical properties by activating at least one proteolytic enzyme in the skin's stratum corneum. The light emitting tubes can hang straight under their own weight, and each are fabricated from a transparent protective sleeve, within which a plurality of the plastic optical fibers are disposed. The pressure limiting valve is adjustable as a function of the magnitude of a pilot control signal serving to trigger a main control valve. The driving wheel is rotatably supported by the bearing unit. The fluid outlet manifold may further include a fluid outlet channel and a fluid outlet reservoir. The air duct is disposed on the second surface of the housing base, and cooling air flows through the air duct.

1459828713-fb253944-e74c-4fbc-a9f4-8cabe85d6e81

A movable barrier operator can use a first technique to prevent an excess application of force during controlled movement of a movable barrier and at least a second technique to similarly prevent an excess application of force during such movement. Then, an oxidized film 105a formed by the irradiation of the first laser light is removed. Methods are also disclosed for making such compositions. The ultraviolet dosage delivered to the HVAC system can be controlled by varying the number of lamp standards, number of lamp modules coupled to the lamp standards, and spacing between the individual lamp standards. The flexible solar cell may be used to provide power to an electronic device.

1459828714-c75c4de5-d23e-4bad-84c4-7a9cd551216e

The present invention provides a novel 1H-indazole compound having an excellent JNK

inhibitory action. miyabeana named \u2018Tully Champion\u2019, characterized by rapid stem growth producing greater than 25% more woody biomass than two current production clones, more than 2. Upon display, the still image data sets are in a non-selection state. The bandwidth transforming node can also offer data bandwidth to the subscriber in preassigned increments. If the operating profile differs from the baseline profile by more than a certain tolerance an alarm may be sent or another action taken, for example the pumping system may shut down, etc. The local terminal includes a first measuring unit for measuring a first human body temperature, a signal processing unit for receiving and converting the first human body temperature, a display unit coupled to the signal processing unit for displaying the converted first human body temperature, and a first interface unit coupled to the signal processing unit.

1459828714-e01bf962-21f5-45b2-8754-b64c1e1a4528

A light-emitting diode and a method for manufacturing the same are described. A first image part of the first group of image data, a second image part of the second group of image data, and a third image part of the third group of image data are identified, wherein the positions of the three image parts correspond to a motion trajectory that is indicated by a candidate motion vector. In another implementation, a common credential store is used to share data for a plurality of user accounts associated with a client between a plurality of applications of the client, and for the applications to output multi-user interfaces having portions corresponding to the plurality of accounts. The operating mechanism includes a frame disposed within the base, a cradle in pivotal connection with the frame, an upper link in pivotal connection with the cradle, and a lower link having a first end and a second end, the first end in pivotal connection with the upper link and the second end in pivotal connection with the rotor at the separation portions. A circular concavity is formed in the back of the semiconductor wafer in correspondence with the device region, and the device region is relatively thin, while the surplus region is relatively thick. The general purpose computer apparatus further includes means for interfacing the central processing unit to the system bus and means for interfacing the central processing unit to an IO bus.

1459828714-f03c377e-426a-49f4-b083-50f0ace419da

A new and distinct cultivar of Helleborus plant named \u2018HGC Jacob\u2019, characterized by its compact and mounded plant habit; dark green-colored leaves; and white to light green-colored flowers. Each pixel is subjected to a rough classification based on first criteria that determine whether or not a pixel is relevant for an object recognition. Each station maintains its own local database regarding the status of the network by reading the information in each time slot. A radial wall extends from the circumferential wall away from the longitudinal axis, and a circumferential extension extends axially from the radial wall.

1459828715-0f56329f-4f7f-4dae-8f9e-1efb1a7b7ff0

An engine is described for operation on a fuel expanding about adiabatically in a power stroke of the engine. By careful control of such factors as the melt temperature, order of addition of alloy components, cooling temperature and withdrawal rates, continuous casting of high quality lead-free bronze alloys can be achieved. Each of the RAM modules has a first enable pin and a second enable pin connected to output pins of the logic circuit. A cam bar includes a cam end for engaging with the first side wall of the wedge block. In one embodiment, at least one of the layers extends within the substrate at least partially outside the perimeter of the sand trap.

1459828715-5a92966f-4857-4b66-a9ba-483d332e496d

An Automated handling system has a working area, at least one object in the working area, at least a first numerically controlled arm and at least a second numerically controlled arm. The intermediate section is shaped to mate with adjoining edges of the first and second panels. A unitary actuator has a first end engaging the pin

guide for common reciprocation relative to the nosepiece body and a second end engaging the cage. The timing is defined by a threshold concerning a cumulative film thickness of the thin film.  $1 \times 10^{-3} \text{ cm}$ , and wherein, when  $T \times 10^{-3} \text{ cm}$  represents a thickness of the polymer layer,  $T$  and  $x$  satisfy the relationship  $2x \times 10^{22} 66 T$ . The sheet incorporates conduits that terminate or intersect at temperature measurement locations with a fixed relative arrangement to form a two-dimensional grid for sensing temperature distributions.

1459828715-b82f5714-63eb-4b09-8f8d-a3d24cd4e2f1

An ultrasonic oscillator, comprises a group of internal electrodes divided into four approximately equal parts along two directions, i. Typically, queries of the database abstraction model are directed to queries of a model entity defined for the database abstraction model. Then, a call invitation is sent to each of a plurality of networks associated with the call targets. A selected version of the model is checked out of the repository and loaded directly in a memory so that users may load the selected version of the model without error. The amount of protrusion can thus be individually controlled for the write head element and the read head element. In case too much water is introduced to either tank, overflow drains in both tanks prevent water from overflowing over the top of either tank.

1459828715-bab97818-dce2-4356-a10e-b816c3428e80

A high density interconnection device includes a high density connector block having a plurality of jacks disposed on the outer surface for common interconnected to a high density connector. When performed in response to a user request, the method includes the steps of combining a randomly selected word element, such as an affix or adjective, and a randomly selected stem, such as a noun, to produce a random account name, and comparing the name with a list of existing account names to determine if it is unique. The plastic sheet includes an outline of at least one auxiliary lens, and scale markings to show a distance from the outline of the auxiliary lens to an approximate peripheral edge of the eyeglass lens. The indentation lies partially inside the pouring spout and partially below the same after unscrewing of the cover cap and forms an air inlet channel, which results in a steady outpour of the liquid content of a combipack. A central portion of the diode has a smaller width than widths of upper and lower portions of the diode. The light blocking member includes a light blocking portion and a plurality of light passing portions arranged at positions corresponding to the lenses.

1459828716-0414bc3a-32f5-4710-bf79-1bd09df96fef

A filter assembly for fluid filtration having a push-activated lock and release mechanism. Each siding unit is a profile of a composite material which includes a thermoplastic polymer and a cellulosic fiber. The system controller displays at least one operation candidate item on the screen when the detected distance becomes not larger than a first threshold distance. A first plurality of elastomeric elements is integrally formed with the elastomeric support element. Therefore, the memory device has excellent processability, high reproducibility, and uniform performance.

1459828716-40069571-61e4-4942-b20b-653e1c2d86ef

A telecommunication device includes a first interface coupled to the public switched telephone network in a first local calling area, a second interface coupled to a packet network, and a third interface coupled to a first plain old telephone system telephony device. The query includes a number of  $N$  query descriptor types for a query object. The front housing can include a front first side and a back second side opposite the first front side, the back second side facing the first side of the frame. A covering material such as lanyard material or polyester is slipped over the plastic core and is heat sealed at one end. The difference engine performing a third procedure to generate difference data if the size of the reference file is greater than the second threshold size. A hook shaped locking proximal portion of the partitioning wall plate interengages an inner

locking groove.

1459828717-5643e713-fd7b-4c37-a929-011cec13146a

A mutant bacterial acetolactate synthase which is resistant to feedback inhibition by L-valine is described. A diagnostic interfaces coupled to snow removal equipment and to an analysis retrieves and analyzes data and compares the data to a set of reference data. The buffer layer includes defects at the interface of the substrate and buffer layer. The coating of component parts may be used for aircraft turbines or gas turbines or for garbage incineration systems having temperature-resistant protective layers against high temperature corrosion.

1459828717-6de36ee7-ec7a-4e24-90dc-cb6d538ca9ac

Methods and devices for rapid diagnosis and monitoring a patient for disease or effectiveness of treatment in real time. A first sleeve connects the interior of the valve housing to a first suction channel of the instrument; and a sealing membrane seals a first portion of the interior of the valve housing from the valve insert. The system can be connected to both a water source and a place for drainage, selectively communicating with the water source to supply water through the water passage to the user apparatus at one time, and at another time communicating the place for drainage to withdraw water from the user apparatus and deliver the withdrawn water to the place for drainage.

1459828717-73a2892b-0034-4074-861e-734befb84309

A system and method for obtaining photographic products and/or services comprises bundling image capture and printing technologies into products and/or services that are paid for by a consumer with monthly or yearly subscription fees. The probe includes a sensor for measuring attributes of a fluid such as liquid or gas. For this purpose, a raw material for a reaction is allowed to flow through an inflow hole in a swirl structure so that the raw material forms a rotating flow to progress. The optical system leads light rays from an object to the image plane without forming an image in the prism and has a pupil in the prism. A predetermined mask material is patterned by carrying out electron beam lithography based on the corrected proximity pattern data. Specifically, the invention is directed to -N-{4-cyano-2-phenylmethyl}-3-{4-methyl-6--1,3,5-triazin-2-ylamino}cyclohexanecarboxamide; or a pharmaceutically acceptable salt thereof, and N-{4-cyano-2-phenylmethyl}-3-{4-methyl-6--1,3,5-triazin-2-ylamino}cyclohexanecarboxamide; or a pharmaceutically acceptable salt thereof.

1459828717-95091564-79c4-4748-be0a-ca31431e2b0f

A wireless communication system includes base stations with adaptive antenna arrays that communicate with remote communication devices. At least one working assembly of the working assemblies is controlled by an input mechanism operatively connected to the control device and having a specific first function in the harvesting mode. The image data memory stores display data. The apparatus may also include a stop abutment to prevent interference by an upstream article with an article which has been selected for lateral transfer.

1459828717-d63fe81e-01c6-49a6-a543-f53ae26401fe

A Ni-base alloy which has excellent resistance to permanent set at high temperature and which can be produced at low cost, a heat-resistant spring made of the Ni-base alloy, and a process for producing the spring. The Dragon cipher includes message authentication code and keyed random number generator. The housing may also include a plate mounted on the front surface of the housing and the exciter may be attached to the plate, which serves as a resonance plate. The faces are formed in an uninterrupted manner on upper end faces of partition walls provided to opposite side end portions of the base. The terminal also includes a security function configured to perform a comparison of the private content identifier to the smart card identifier and to grant access to the private content when a result of the comparison is positive.

1459828718-9991656e-427b-4708-9e66-f81805e94d99

A stacked package and method of manufacture are provided. The color filter array is useful in electro-optic displays, especially reflective electro-optic displays. In a second step, a write head of the hard disk drive writes with a weak field. Thus, listening participants are given an opportunity, according to need, to perform power control signaling on the group traffic channel. A method for manufacturing the organic electroluminescence device is also provided.

1459828718-bd6216fb-b8c4-4533-a59b-8f10af794c7f

The present invention provides a method for installing at least one sensor device within a rotor blade of a wind turbine. A voltage generator is disposed between a first voltage and a second voltage, and includes a plurality of resistors for dividing the first voltage and the second voltage. The apparatus also includes a maximum and minimum data values detecting block; a color difference interpolated value calculating block and a luminance interpolated value calculating block which obtain the color difference interpolated values and luminance interpolated values of the defect judgment target pixel. The top surface has an area smaller than the area of the bottom surface. Additionally, the computer-implemented method receives from a patient one or more responses to one or more medical assessment questions; and causes one or more computer systems to associate one or more medical study instruments with the patient, with the association based on the one or more responses of the patient to the one or more medical assessment questions. An apparatus for implementing this method is also disclosed.

1459828718-f0574ef2-db9b-434b-8b1b-7eae6a7f0e4c

The invention relates to a module having a circuit carrier and having an electro-optical transducer mounted thereon for coupling in or out optical beams which are fed or conducted away via an optical fiber. The connection member is connected to one end of a cable, while the contact member is intended for contact with a corresponding contact member on a second contact finger. The method generates at least one point cloud data using the sensor data received from the at least one sensor, each point in a said point cloud having a point covariance derived from the pose history data. By employing the current detection values, the high voltage control unit can identify and provide notification of a location where the leakage current is increased and the insulation is deteriorated, and can request an operator to perform maintenance for the pertinent location.

1459828718-fe31cf3e-3e3c-4b9f-b159-7bbe48d0d457

A recliner adjuster for appropriately adjusting an inclination of a seat back with respect to a seat cushion includes a worm rotatably mounted on the seat cushion, and a helical gear held in engagement with the worm and mounted on the seat back via an auxiliary locking mechanism. A circuit pattern including plural membrane switches is formed on the light-guiding membrane wiring board. The body having a first internal wall defining a ground rod cavity and a second internal wall defining a ground wire cavity being positioned adjacent to and in communication with the ground rod cavity.

1459828719-34023f5d-b455-403c-bfee-4d99977a8201

Acid concentrates, and dialysate compositions prepared therefrom, contain citric acid and an effective amount of a buffering agent selected from acetate and/or lactate. The components are thereby welded in the joint zone by means of heat input generated by laser radiation, wherein at least one of the components is at least partially transparent to the laser radiation and wherein the laser radiation is at least partially absorbed by at least one of the components. A failing test run may be taken and rerun several times with small changes in the inputs. When a particular label item is selected, a presentation component launches proximate to a label item in response to interaction with the label item and presents additional information from the target webpage. In some such embodiments, reinforcing member

has a distal end, and the tip structure is disposed on the distal portion of the inner tubular member adjacent the distal end of the reinforcing member. In a second and third preferred embodiment, the sender of the instant message will be informed of the available alternative.

1459828719-93ff1605-4f24-49ec-be58-ac6e0740eab3

In an electrophotographic printer or copier, toner images of images to be printed onto a printing substrate are generated and fixed, causing sliding characteristics to be worsened. Therefore, in DMOS and NMOS transistors constituting a cascode amplifier, the gate of the DMOS transistor of an initial stage is biased to a grounding voltage through a resistor, and the source of the DMOS transistor is connected to the output side of an inverter through an inductor. The power values are examined and if they exceed the specified budget, which may be one of multiple possible budget values, an estimate of the amount by and duration for which the closed-loop powerperformance control would have to reduce the performance of the system for each interval in order to provide an estimate of actual performance for the budgetary level. The emitted fluorescent light passes through a narrow spectral band-pass video camera filter and is detected by a video camera mounted in the tool sensing head. The memory device is configured to store information received from the device under test and to output stored information to the device under test. Depending on the value, the data packet is either received or accepted.

1459828719-e0d5aba8-21b8-4954-b8ad-8614b6391b22

A propeller spinner for a marine propeller having multiple propeller blades attached to a propeller hub that is adapted for attachment to a propeller shaft and includes a sacrificial anodic material for protecting the propeller shaft and/or propeller hub from corrosion. 2 and 2 dlq through a feed opening to a polymerization reactor; discharging the introduced prepolymer from holes of a perforated plate; and polymerizing the prepolymer under reduced pressure, while allowing the prepolymer to fall along the surface of a support that is open towards the outside at a temperature between the crystalline melting point\ u221210\ xb0 C. A device according to the present invention may be caused to be operated beneath the surface of the ground, as in cases where it is desired to remove root masses and whole trees, such as mesquite and other species. The etch-stop layer is made of a suitable material such as copper-oxide or nickel-iron-chromium. A recess is defined in the flange and substantially aligned with the hole. First and second through-vias, which are a pair of opposing through-vias located closest to a terminating end of the signal strip, are disposed apart from each other by a distance smaller than a distance between any other pair of opposing through-vias.

1459828719-e6ecbc58-ef0f-406b-a478-6b91ba06024c

A computer system and an attached input unit are provided for a user to input data. The polymer is highly scratch resistant and has a characteristic low dielectric constant for providing a low attenuation to electric fields. The interconnect extending from the ESD protection element to the internal element includes metal interconnect layers equal to or smaller in number than the plurality of interconnect layers used in the interconnect extending from the external connection terminal to the ESD protection element. The sheets are then stacked together and sewn or otherwise affixed along a single axis.

1459828720-788ee568-145d-42e1-933f-8fb9314e4f69

An information processing apparatus includes a determination unit configured to determine whether or not a region having at least one pixel of an image includes a predetermined number of anomalous pixels, and a creation unit configured to create information indicating the determination result for the region. With only one hard mask layer, ashing damage to the insulating layer is prevented using a hard mask layer and an etch-stop layer that are different in etch rate from that of a self-aligned spacer. In the method at least one target value is selected for the control signal, the frequency of the adjustable oscillator is adjusted to substantially

correspond to the target value and the value of the control signal and the target value are compared. The bit maps and timestamps preserve the most recent version copy order of the tracks on the secondary volume. Each chamber is fed by passages and the main chamber is fed by a passage which passes through the cap, the cap including at least a spraying device in the form of a mini snow gun operating as nucleator. Process for the manufacture of 1,1-difluoroethylene employing it.

1459828720-8c5fcad9-dcec-4d3c-8d1b-2884e371dd1b

In blow molding, each mold has two or more cavities, each respectively fed by two or more parisons. One or more entities associated with the particular content may be identified by the content processing device. A variety structurally related connectors, comprising at least a connector body, lip and base flange are described. Additionally, aspects of the invention provide an inspection environment that incorporates preliminary measurement data, wireless communications, and/or historical data into the measurement and evaluation process. A plasma accelerating portion includes a plurality of grids transversely arranged spaced apart from each other by a predetermined distance in the channel for accelerating the plasma beam generated by the plasma generator to the outlet port of the channel with an electric field. A member rear upper is mounted on the floor member front.

1459828721-cc09a1bf-07a2-4387-85b0-37d2188d2d8e

A method of fabricating an organic device is provided comprising providing a first solution comprising an organic semiconductor or a precursor thereof; a solvent and a decomposable polymer additive, where the polymer additive is heated so that it decomposes into gas. The rubber particles, when unconstrained, are essentially spherical and have a rubber particle size of 2. A first electric heating element arranged to provide heat to at least a portion of the first cooking surface, and a second electric heating element is arranged to heat at least a portion of the second cooking surface. The at least one stand-off leg is configured to be set at one of the plurality of pre-measured settings to interface with the building and to position the plurality of spray bars a desired distance from the window for testing the window by spraying the fluid from the at least one nozzle of each of the plurality of spray bars toward the window.

1459828721-ccb8e788-56a3-4856-ad6b-64bdd09286a5

An apparatus for insertion of a medical device in the skin of a subject is provided, as well as methods of inserting medical devices. While the vacuum chamber is being evacuated to a pressure of between 0. The upper storage has an upper opening for receiving and dispensing a life jacket that is retained within the upper storage by a securing strap. The thermal protection circuit includes a power conditioner for providing regulated power rails to the other components of the thermal protection circuit. Thus, an alignment failure can be reduced because a particle on the wafer is not mistaken as an alignment mark.

1459828721-eb21d2c2-5148-425d-9325-4a8dfb33ec7e

Embodiments of integrated passive devices and methods of their formation include depositing a composite electrode over a semiconductor substrate, and depositing an insulator layer over the composite electrode. The information processing apparatus includes a sensing-area setting means for setting an area used to sense information on objects, and a transmission-area setting means for setting an area used for transmitting information on an object. Elongate stock exits from an exit aperture in the forming machine, and is directed over the table of the portable table saw mounted upon the movable carrier. The support means are preferably of a unitary urethane construction with the contact lobe element portions being of a hollow configuration. The second surface is sized to support the handheld media device when the handheld media device is placed thereon. A breakaway feature may release the first interlock when the closing force exceeds a predetermined level.

1459828722-2d729a06-dc6d-4510-a1a1-2916dcdd82d9

A method of generating an audible indication of data stored in a database and representing a group of data points. The content management system is customized by one or more coding language databases, and is adapted to read and process multiple different writing samples simultaneously, whether sent synchronously or asynchronously, to allow a user to select from a plurality of fonts to include in an autograph. The control information is provided in a retrievable manner, according to the included range of validity, in a memory organized according to ranges of validity and is associated with the first computer-based object. The flap folding system has a first flap folding member configured to fold a fourth top flap of the box, a second flap folding member configured to fold a second top flap of the box, and a pair of oppositely disposed side flap folding members configured to fold a first and third top flaps of the box so as to abut each other. A first bandwidth module can include a first interleaver that interleaves bits of the first partial MIMO stream and generates first interleaved data.

1459828722-68f2a834-45c1-4a5b-8f81-eea583cf7602

An impedance adjusting circuit for adjusting an impedance of an output buffer of a DDR2 memory, using an OCD impedance adjusting function, from a side of a memory controller, includes first and second terminals, first and second switches, a comparator, and a control circuit. The foregoing is preferably achieved in accordance with a boundary scan standard 1149. Then, heat treatment is conducted on the proton irradiated layer for transforming the protons into donors to form a high concentration n type semiconductor layer. The clock board may generate a global clock signal, which may be distributed to the switch boards and the power distribution board.

1459828722-76297f45-a34b-4139-8710-142518b47f81

A method for converting sample rates includes obtaining coefficients from a sample rate conversion coefficient table. A handle is connected to an outer surface of said rose and a mounting plate is connected to said inner surface of said rose. Both formal and informal learning is defined for each zone. The fastening device includes a first fastening portion mounted on the pressure element and a second fastening portion which can be mounted on the reinforcing element.

1459828722-c08debb1-4db2-4ae9-b4aa-28b19c7671d4

Mechanisms are provided for transforming an original graph data set into a representative form having a smaller number of dimensions than the original graph data set. The controller is to lower an operating point of a first core if a first number based on processor clock cycles per instruction associated with a second core is higher than a first threshold. The handle includes the following: a body having a housing to receive the fastening element; a retaining element cooperating with the fastening element when the latter is within the rear housing; and a latch.

1459828722-df2d2f92-28b6-4502-98de-b592c8bbd730

A method of making a fiberoptic dental light probe having a bent distal end with a tapered tip. A first wireless communication device may transmit Xi copies of each ith packet in an N numbers of packets over a wireless communication link to a second wireless communication device. A transmission electromagnetic field from the sensor control unit is reflected by the metal reflection plate and transmitted to a sensor unit rotated to a position to which the field does not readily reach directly from the sensor control unit. The collaboration server calculates a current distance between the response and the posting, where the current distance represents a quantity of responses to the posting from forum participants that have occurred without a new response from the posting user being submitted to the communication forum.

1459828723-01be9bbb-31c5-4afb-b31a-11b94a6cf021

Containers are provided for packaging flexible substrates such as the glass substrates used in the manufacture of liquid crystal displays. The invention also

relates to a corresponding fabrication method. When such a condition is encountered, the starter control apparatus releases the engagement of the pinion with the ring gear while keeping the pinion rotated by the motor, thereby decreasing the torque exerted by the ring gear on the pinion to minimize the wear of the pinion.

1459828723-56c956b4-9de6-4f81-853c-b341b97218e5

Various embodiments are described herein that provide one or more of a systems, methods, software, and data structures within an Internet marketplace context that are useful to promote products that may be associated with an event occurrence. In response to user login requests, login access is controlled by providing multiple users login access to plural electronic devices capable of communicating via the communication system. The valve assembly defining a fluid flow path passing, in a first fluid flow mode, between the valve member and the valve seat, and into the fluid passage. The invention can be potentially applied to other systems comprising a swellable hydrogel and a nonswellable hydrophobic polymer. The flow is interrupted by a holding reservoir which is drained by siphoning, gravity and capillary forces. If no in-focus location exists in the image, the image display apparatus performs display of warning information and/or a warning by sound, and prompts the user to confirm necessity of printing.

1459828723-97dbcb3a-d575-480a-8b80-3c93800c6f98

A method for adding a new wavelength to an optical communication network is provided. In an embodiment, the current supplied to a motor that drives scrubbing elements in an applicator in order to identify or determine when a teat of a cow is inserted and then removed from the applicator during a wash mode and dry mode. A next step 406 includes reporting feedback on measured channel conditions for the zone at a first time for the at least one beam combination and associated resource block of the zone. The method also includes sending, from the configuration server, the requested information indicated by the at least one of information requests and inform messages over the network to the apparatus. Strategic placement of beaconing devices that are encoded with pre-defined, specialized SSIDs allows information to be forwarded to the mobile clients to trigger specific behavior in the clients and to enable the clients to pro-actively control network transitions, thereby increasing their ability to provide seamless communications.

1459828723-d7ed90f2-6b07-47d1-bab8-f28a2317af80

In method of controlling an optical amplifier dynamically adapts to both configuration and performance changes of a communications system. The electrode system includes two electrodes that are shaped and oriented to cause the current to flow from one electrode through the wound to the other electrode. The shaft defines a partially hollow bore and an orifice, the orifice being disposed on a sidewall of the shaft distal from the hopper and proximate with the juncture between the shaft and the spike. The decomposition is performed on the assumption that the x-ray attenuation value  $xM$  of the body material without the substance is composed of the x-ray attenuation values  $xM1$ ,  $xM2$  of the first and second material component in accordance with the following equation:  $xM=f*xM1+*xM2$ ,  $f$  being a volume fraction of the first material component in the body material. The present invention enables adjustment of the sample fluid flow rate while maintaining a constant total fluid flow through the flow cell, and further, enables pausing the system without significant fluctuations in the vacuum. At any point following a cleaning cycle, the granule collector can be removed to add more granules and to simplify the cleaning of the apparatus.

1459828724-2a59a903-958d-4fdd-aa18-c44a542475b6

A system and method for performing a depth estimation procedure utilizing defocused pillbox images includes a camera device with a sensor device for capturing pillbox blur images of a photographic target. The CMOS image sensor includes at least one microlens formed by anisotropic etching to have a focusing centerline, a central

lens portion, and a peripheral lens portion, wherein the focusing centerline passes through the central lens portion and wherein the peripheral lens portion surrounds the central lens portion. A sleeve within the male connector body may be adapted to extend within a bore of the female connector body. A multiplicity of logical elements can be installed to provide an optical processor. In halftone mode, the memory is operable to retrieve a halftone threshold signal which is supplied to the threshold multiplexor.

1459828724-c1888775-8d11-4b03-8a14-06e5311de982

A distributed data archive device is placed on an arbitrary location on a network so that data can be saved and extracted. At least one moveable object is configured to move within the container. Three spaced apart separable coupling brackets are secured to the half tubes across a seam.

1459828724-d5698706-1e5c-4ee4-8a80-aa9dd21e34f5

A lens barrel and a projector of the invention are provided with a fixed cylinder, and a cam ring mounted on the fixed cylinder. When the stored job is selected, a previewer displays a list of jobs, and displays a print preview image. The port switch SWP1 transfers the frames received from the port switch SWP2 through the redundancy port Pr to the fabric switch SWF1 that is the original transfer destination. The fused recessed rib ends are integrally fused to either opposite recessed rib ends or the facing opposite wall at a welded surface such that the height of the recessed ribs from the first wall to the welded surface is about approximately 15. By way of example, transforming the first layer may include annealing the first and second layer. In this way, the air compressor 1 is made to function as a data collection terminal to collect data necessary for work management from the time card 3 of the worker.

1459828725-3314464f-25e0-4179-aff8-77dce1199fc2

A method for recovering a moving picture in which an error occurs provides a more efficient and accurate recovery by enlarging a range of a damaged slice to include regions of undamaged slices adjacent to the damaged slice. The pick-up vehicle includes a swivel device including at least one swivel arm having a curved and/or bent section along its length. A second connector is mateable with the first connector and has an actuator element engageable with the mating detection element of the first connector. A space between the outer frame and the inner frame is filled with a shock absorbing material, thereby imparting shock absorbency to the casing itself. A movable support platform receives thereon the conveyed articles and is sized for location in the carton space between the sidewalls.

1459828725-706eeb26-e544-4f91-b9a2-57b1bb775a5a

A method and apparatus in an optical disk system employing a decision feedback equalization technique to provide a boosted signal resolution at a data slicer input while minimizing noise. An electronic control unit controls a motor drive and a sensor arrangement, coupled to the control unit for detection of at least one axial position of the locking bolt arrangement. The ejector mechanism includes an ejected part, which is arranged parallel to the bed board. As a result, similar conversions are achieved at a considerably lower cost. Additional polymer non-solvent is then used to remove the real polymer solvent from the solid polymer precipitate followed by drying. A complete temperature profile of a paving work area, including a comparison with the model may be recorded in computer readable memory for forensic and predictive analysis.

1459828725-922aad0d-e17f-4e15-880d-c58f97581c83

A computer-implemented system for processing a customer application for a wireless telecommunications device is provided. A positioning flange extends outwardly from the peripheral sidewall at the open end. The flow-modifying arrangement is configurable in an inactive configuration and in an active configuration. A weight for the votes is determined based on the sources, and a confidence indicator is

determined base on the weight of the votes. When the hard disk's idle time meets a dynamically computed power control idle timeout, the disk driver is commanded to power down the device. Rubber compositions containing the liquid antiozonant mixtures is also provided.

1459828725-e1444966-85c2-4b45-8b86-7509bb522570

Coherent detection of a received EM signal using universal frequency translation is described herein. The compounds possess valuable therapeutic properties and are particularly suitable for treating diseases that respond to modulation of the serotonin 5-HT<sub>6</sub> receptor. Panels 15 are quilted according to a schedule and in batches in the most efficient manner, and panels are cut according to information read from records on the material.

1459828726-90103aa3-03fc-4609-ae41-1b1e9637ca82

A method, test reagent and device usable as a test strip for detecting toxic ammonia levels in water samples such as aquarium water. A voltage signal  $V_{in}$  provided by the feedback network 8284 characterizes all errors caused by the driving opamp 76. The method and system include providing a plurality of fragments for the at least one object. The aggregated package can then be sent to the purchaser via an email address supplied by the purchaser at the time of the purchase or by the purchaser's bank while completing a funds transfer for the transaction. A second knowledge base step is performed to construct an improved high-frequency component from the enhanced high-frequency component. A magnetic film with the addition of a high resistive metal such as Cr or Mo is formed under the plating condition.

1459828726-a69b1fad-31e0-4c9a-a758-8a164a271467

A diesel engine system includes a diesel engine, a throttle valve, an EGR path, an EGR valve and a controller. Therapeutic and/or rehabilitative functionalities provided by the orthosis machine may be powered by the user or a motor and may be used through one or more phases of post surgical and/or general rehabilitation and physical therapy from multiple angular positions. The bracket includes a first sidewall defining a receiving groove in an end thereof. The tension in the yarn is controlled; the yarn is weaved; and a crimp is applied in the yarn.

1459828726-eb9aa8d6-8463-41f3-a64a-3691acf71bfa

A disrupter to a target may be precisely aimed by positioning a radiation source to direct radiation towards the target, and a detector is positioned to detect radiation that passes through the target. An air supply chamber 81 is divided into a plurality of parts 82 and 83 corresponding to a plurality of burner groups 51 and 52. The through hole into which the support is inserted is formed on the side surface of the case.

1459828726-f62b8dc4-37b3-4201-80c7-5afe7793ff2c

A repeater system for receiving a modulated input signal and for transmitting a modulated output signal comprising a clock oscillator for providing a repeater system clock, a demodulator for demodulating an input signal and a modulator for modulating the demodulated signal to obtain a modulated signal. When the write voltage polarity is inverted every plurality of lines, in the  $n$  line where the polarity is inverted, the rise in the drain line waveform dulls due to the charging of the drain line. The first and second multi-layer laminates are joined together at the unlaminated portions by interleaving a plurality of dielectric layers of the first and second multi-layer laminates. The invention further relates to the inbred and hybrid genetic complements of plants of variety CV125252.

1459828727-3a0c6139-8f9c-4697-b17e-700d9b64ed3d

Mapped data of line pressure set to any of high pressure/low pressure regions on the basis of an engine load are stored in a storage section. A second semiconductor package which is located on a lower side includes a second printed wiring board.

Hence, data is concurrently transferred to and transferred from the data FIFOcaching memory.

1459828727-5d9a760a-814a-49c2-aa4c-348736e4041d

An apparatus and associated method of generating a multi-core communication topology. The interface includes a scenariosresults processor that enables the user to prescribe an optimization scenario, and that presents the optimum prices to the user. The tip-resistant sheet can also utilize a composite material formed by laminating an elastic material onto a metal material and the spherical bodies, different from the elastic material and having a diameter equal to or larger than the thickness of the composite material, are placed against surface of the composite material. As a result, micro and nanometer structures can be patterned without being limited by light diffraction in conventional lithography methods.

1459828727-72f0f96d-c29a-4dda-a819-188f8715e3b5

A terminal for at least one electrical conductor, comprising a terminal socket and a clamping spring, wherein a clamping force applied by the clamping spring clamps the electrical conductor to the terminal socket, and wherein a screw coupled to a support element is provided, by which at least one section of the clamping spring is movable relative to the terminal socket. The method includes a propagator with a ratio of Green's functions for the location within the volume and for the spherical array radius, and a Tikhonov regularization filter that uses the Morozov discrepancy principle on the measured noise variance and Fourier coefficients of the measured partial pressures with respect to reference accelerometer or microphone measurements. Also disclosed are methods for promoting proliferation or differentiation of osteoblasts, osteoclasts, chondrocytes, or bone marrow stem cells comprising culturing the cells in an effective amount of a zveg3 protein. In exemplary embodiments, at least one seal may be located between the plurality of plates to create a substantially air tight and substantially water tight seal between adjacent ones of the plurality of plates to aid in preventing the aqueous solution located between adjacent ones of the plurality of plates from leaking out of the cell.

1459828727-9e69e123-1116-454d-bdc8-2df47232aadd

At least one antenna array including three mutually orthogonal antennas each sharing a common center point senses an electromagnetic signal emitted by a buried object such as a utility line, pipe or sonde. A CPU activates each of the red LEDs 10R and green LEDs 10G for a predetermined period to emit light in a luminance level in accordance with image data. A thin film transistor is formed on the first substrate in each sub-pixel. A direct communications link may then be established between a first network access device hosting an available resource and a second network address device using the personal network address associated with the resource. The handle portion engages a cover portion of the housing such that plastic panels are exposed through openings formed in the metal casing walls.

1459828728-073687eb-3598-413d-bc44-7b8aa42765f2

A cartridge for histological specimen slides includes a generally enclosed body and a slide holder. The distribution media then transmits the hash to the target or client, the hashes are compared, and, if they do not match, the update files are downloaded for further review and updating, if desired. The blades 46 are grouped and centered on the winding tunnels of the armature with the axially outer edges of the blades of each group joined together by a radial wall 50 within the radial spacing of the annulus of the plate 42 but axially spaced therefrom. A circuit and method for reducing fixed pattern noise. The communication system, upon implementing a broadcast-type multicast service, enhances compensation of communication breaks when detecting and recovering from a fault in an IP network, and reduces the network traffic.

1459828728-1e9ba545-975b-4139-b7f5-366d772e6a5c

The present invention discloses a data transmission device and method thereof, and a data reception device and method thereof. The second molded plastic component is adhesively bonded to the first component with an adhesive. This request initiates communication between the network endpoints through the set of network resources. A voltage drop caused on one of the paired global IO lines by turn-on of the read gate transistor is amplified by a main read amplifier to obtain read data. At least a portion of the interconnects for each tub have an exposed portion on a side of the submount and at least some of the plurality of the interconnects are not connected to other interconnects in the submount.

1459828728-636ca46e-85c9-41b5-a052-f5ba361b72fc

An apparatus and method for expediting parity checked TLB access operations is described in connection with a multithreaded multiprocessor chip. Since the gadolinium complex compounds of the present invention such as that represented by the following structural formula exhibit responsiveness to potassium ion, calcium ion, glucose or the like, by using the gadolinium complex compounds of the present invention as a MRI probe, the ion or compound in a living body can be detected and concentration distribution thereof may be determined. At least one spacer and the gate electrode mask a portion of the surface during the ion implantation process such that the source extension and drain extension are asymmetrically positioned with respect to the gate structure by an asymmetry measure. The host computer uses the model-specific parameters of the printer and the control command to process image data that is output to the printer.

1459828728-90dcfb72-7615-422c-b2f3-d353d11cbe15

A system for displaying an embedded intelligence applet comprises a processor and a memory. A fraction of at least one constituent material is determined for each pixel. Providing a smooth transition for the wave fronts minimizes the occurrence of eddy currents so that diffractions do not interfere with the quality of sound from the driver. In response to a directory enumeration request from a client computer, one or more directories of metadata files on one or more of the file servers are enumerated, instead of enumerating the data file that store the user file portions.

1459828728-99f39a36-9c0a-4d9a-a040-f590cd3a175d

A method of concealing bit errors in a signal is provided. For this purpose, a hard mask material may be used during a process sequence for forming offset spacer elements in one gate electrode structure while covering another gate electrode structure. The pedestal driving voltage and the brightness control voltage can be reciprocally controlled without modifications to a circuit having limited amplification, and the brightness can be improved without saturating an image in a highlight mode.

1459828729-0ef1cdbf-b840-4b4b-9c00-1f3878c13231

A device and method is provided for providing a notebook computer casing whose contour and outward features can be change by the user. Illustrative compositions comprise one or more ovarian tumor polypeptides, immunogenic portions thereof, polynucleotides that encode such polypeptides, antigen presenting cell that expresses such polypeptides, and T cells that are specific for cells expressing such polypeptides. The method further includes executing the at least one command in response to receiving the user inputs to execute the at least one command. The apparatus and method of the present invention significantly reduces the margin of error related to the application of coatings to parts, the number of defective parts and increases the overall efficiency. Output from the significance function generator is coded using the modified Z-coder. To increase the service life of the injector, the end toward the nozzle needle of the valve piston or of a thrust rod triggered by the valve piston is guided coaxially to the axis of symmetry of the nozzle needle.

A golf bag accessory, for indicating the removal of a golf club from a golf bag, has a base member consisting of supporting ring elements. The lead frame has stress relief slots formed in the undersides of the lead elements proximate the adhesive to accommodate filler particles lodged between the leads and the active surface of the die during transfer molding of a plastic encapsulant. A first server is present in which the first server receives a request from a client to access a resource, performs an authentication process with the client, add information to the request in which the information indicates that the request is from a trusted source to form a modified request, and sends the modified request for processing. Since the anti-coagulation liquid is applied to the face surface in advance, the generation of the reaction product on the face surface is prevented or suppressed. The present invention can obtain a more complete set of data for all sectors in the data collection area, allowing for more accurate performance evaluation and greater planning information.

Systems, methods, and devices for providing and managing electronic event tickets are provided. Thus, the two lenses can be rotated with respect to the camera lens, respectively, for achieving the independent adjustment of the rotation angle of each lens. A second inverter is provided that has a first electrode coupled to the fourth electrode of the first inverter for receiving the output signal of the first inverter, a second electrode, a third electrode, and a fourth electrode for providing an output signal and that has a propagation delay that is dependent on a second current. A removable food supporting plate is disposed in the body receptacle and on the bottom wall of the main body. Also disclosed is a microelectronic structure comprising a substrate; a plurality of transistors formed on the substrate; and a plurality of conductive features formed within a dielectric pattern, wherein the plurality of conductive features include at least one two-dimensional feature having a dimensional tolerance more precise than 7%.

A semiconductor integrated circuit device employing two clock signal generating circuits which output clock signals for distribution to an internal circuit of the device, the first and second clock signal generating circuits having different clock-settling times and the selection thereof is effected from outside of the device. The device includes a receiver that receives a signal pattern representing electromagnetic field disturbances over time caused by movement of metal doors in a detection region. The method also includes sending a command to join a second multicast group in response to the control message. The nanoscale object is picked from its initial position by the tip of the scanning probe microscope, then placed and released at the target position.
